ICIP QUARTERLY PROGRESS REPORT NUMBER 2
Period: 1 October 1975 to 31 December 1975

(e) Source IC-B-053 reported GS-12 [b6] Edgewood Arsenal, took a woman (NFI) who was not his wife to lunch almost every day since 1 November 1975. The ICIP Coordinator was briefed; no action is pending.

(f) Source IC-B-053 reported GS-14 [b6] Edgewood Arsenal, was observed on approximately a dozen occasions taking a woman, not his wife, to lunch. [b6] was observed taking three or four different women to lunch since 1 September 1975. The ICIF Coordinator was briefed; no action is pending.

(g) Source IC-B-032 reported GS-13 [b6] Edgewood Arsenal, had a reputation of a "mad scientist". Also that [b6] had bragged about having intercourse with an alleged prostitute. On a date [b6] took source to his home and offerred to take care of her financially if she would take care of his sexual needs; source declined. The ICIF Coordinator was briefed. The ICIF Coordinator is making a local inquiry in advance of requesting a Limited Investigation.

(h) Source IC-B-005 reported MAJ [b6] US Army Materiel Systems Analysis Activity, claimed $4.00 for a tip to a baggage handler on his TDY voucher when he did not give a $4.00 tip. The ICIF Coordinator was briefed, follow up action is yet to be determined.

(5) Under the EMI, "Security violations or hazards" (paragraph 9, Appendix 1 to Annex J to OP-001-74-109), the following information was developed:

(a) Source IC-B-080 reported a CONFIDENTIAL document had been left unsecured over a three day weekend. The ICIF Coordinator was briefed; follow up action is pending. (AMSAA Security Officer away TDY until 15 Dec)

(b) Source IC-B-080 reported a security container had been left open during duty hours in an unattended office at the US Army Materiel Systems Analysis Activity. The ICIF Coordinator was briefed, follow up action is pending.

(c) Source IC-B-080 reported [b6] a secretary in the US Army Materiel Systems Analysis Activity left her office unsecured and her security container open for periods of five to ten minutes while performing chores away from her office. The ICIF Coordinator was briefed, follow up action is pending.

(d) Source IC-B-080 reported attending a scientific conference at the US Army Materiel Systems Analysis Activity which had been anounced as classified. Access to the conference had not been properly controlled; however, the portion of the conference attended by source was believed to have been unclassified. The ICIF Coordinator was briefed, follow up action is pending.

(e) Source IC-B-080 reported the Ground Warfare Division of the US

Page 2341 of 3957

~~CONFIDENTIAL~~

ICIP QUARTERLY PROGRESS REPORT NUMBER 2
Period: 1 October 1975 to 31 December 1975

Materiel Systems Analysis Activity had moved to different office space. Prior to the move no technical survey was conducted to determine if there were electronic surveillance devices in the new office space. The ICIP Coordinator was briefed, follow up action is pending.

(f) Source IC-E-010 reported information relative to an adverse morale situation in the Bio-Medical Laboratory of Edgewood Arsenal. The situation was alleged to have been created by DA-level officials unjustly letting b6 take the blame publicly for DA-directed research in hallucinogenic drugs, and that DA was in fact offering b6 as a "sacrificial lamb". This information was immediately passed to the ICIP Coordinator and the Commander of Edgewood Arsenal. The commander raised several questions concerning the personalities involved and the cause of adverse morale situation. These questions were covered at the next meeting with this source and the answers were provided to the commander. The commander asked that ICIP continue to monitor the situation.

(6) In response to the objective of identifying and neutralizing threats of espionage, sabotage and subversion, Source IC-5-030 reported the Human Engineering Laboratory's receipt of two unsolicited requests for information. The requests were from the president of a company which claimed to be involved in the national effort to reduce and prevent crime. The information requested was unclassified. HEL provided the information asked for in the first request, but did not have the information to satisfy the second request. Initial investigation failed to confirm the existence of the company identified in the request. The ICIP Coordinator was briefed and HEL will not honor any further requests from this company until all checks by MI have been completed.

3. (U) Actions implemented or taken by the supported command based upon the information submitted:

Subject	Type Information Developed	Action Taken	Date of Action
b6	Foreign Connection	Monitor	
	Foreign Travel	Monitor	
	Foreign Connection & suitability	Monitor & investigate	23 December 1975
b6	Foreign Travel	None.

ACTION SHEET

CONTROL NUMBER

Report of Unilateral Counterintelligence Program (ICIP) Operation

OFFICE SYMBOL: DAMI-CIC

SUSPENSE:

DATE: 7 March 1979

ACTION REQUIRED

To obtain ACSI approval for termination of ICIP.

MEMORANDUM FOR RECORD *(Describe briefly the requirement, background and action taken or recommended. Must be sufficiently detailed to identify the action without recourse to other sources.)*

1. (U) BACKGROUND: INSCOM-SOD on 9 Feb 79, requested authority to terminate ICIP - LENTIL MONKEY (U) located at the Defense Language Institute (DLI), Presidio of Monterey, CA. The ICIP is an OACSI, DA program.

2. (U) DISCUSSION:

a. The ICIP is a special operational security service employing timely, effective and coordinated use of overt and covert CI sources and techniques to detect elements or factors which are detrimental to security. The primary factor which distinguishes the ICIP operation from CI support normally provided to an installation or unit by MI groups is the use of confidential sources as covert assets in the conduct of the operation.

b. Command security threats covered by the ICIP include acts of espionage, sabotage, subversion, and the activities of hostile foreign intelligence directed against [redacted] the supported command.

c. INSCOM-SOD's status report, 1st Quarter, FY 79, for ICIP Operation LENTIL MONKEY (U) reveals that the operation utilized 16 confidential sources, produced two Summaries of Information, one Source Lead Development Report, 35 Contact Reports and 40 Agent Reports. Further, a total of 1148 manhours were expended on the operation (TAB B).

d. INSCOM-SOD has suggested that a different type program would be better suited to provide the required security assistance for the DLI, i.e., a Dedicated Operations Security Support Program (DOSSP), which does not use confidential sources and which can be readily implemented by the 902d MI Group with existing personnel assets. A DOSSP is described at TAB C. The DOSSP for DLI would be tailored to satisfy local security requirements unique to DLI.

(U) LENTIL MONKEY: (QSR, 1st QTR FY 79)

a. Location: Defense Language Institute (DLI), Presidio of Monterey, CA.

b. Confidential Source Utilization: Sixteen

c. Information Obtained or Reported on Non-affiliated Civilians: None

d. Useful Information Obtained:

(1) An instructor of the German Language Department (GLD) who visited East Berlin while on a trip to Europe, failed to comply with DLI regulations directing prior reporting of such visits. Two other GLD instructors may have also visited East Germany during the quarter without reporting the event.

(2) Instructors of the Polish Language Department encouraged students to attend a dance sponsored by a Polish ethnic organization in Oakland, CA in January 1979. It was stipulated, however, that the students must attend the dance in uniform.

(3) According to a report from another government investigative agency, a recently hired Russian Language Department (RLD) instructor had previously been of interest to a Yugoslavian intelligence agent working out of the Yugoslavian Consulate in San Francisco while the instructor was attending DLI as part of an exchange program in the late 1960's.

(4) Several instructors in the Chinese Mandarin Language Department (CMLD) are opposing the new Interagency Course Curriculum. Instructors have been reported to be inflating exam grades in order to present a false impression of student abilities. The students lack of language capability will be manifested once they reach field assignments and thus discredit the new course.

e. Operational Status:

(1) Sixteen confidential sources were active during the quarter. Four sources were terminated and one new source recruited. Ten conventional sources also provided information during the quarter.

(2) During the reporting period, information obtained from all sources, including that acquired from overt liaison activities, resulted in production of two Summaries of Information, 35 Contact Reports, 65 oral reports to the DLI Commandant and/or designated representatives, one Source Lead Development Report, and 40 Agent Reports. A total of 1148 manhours were expended on the ICIP during the 1st quarter.

(3) On 18 December 1978, the required quarterly briefing was presented to COL Thomas G. Foster III, Commandant, DLI. COL John Gargus (USAF), DLI Deputy Commandant, LTC Richard P. Kelly, DLI Executive Officer, LTC Waldo R. Webb, DLI Security Officer, and MAJ Michael A. Parkes, Commander, Fort Ord Field Office, 902d MI Group, also attended the briefing.

(4) As a result of the quarterly briefing and based on information reported during the quarter, the DLI Commandant directed the Security Officer to prepare a letter to be sent through channels to the GLD instructor who visited East Berlin (para d(1)) requesting an explanation for his failure to comply with DLI policy. Additionally, the Security Officer will intensify efforts to develop policy concerning appropriate instructor-student relationships/behavior. The Commandant also directed the DLI Information Officer to publish a notice emphasizing restrictions on military personnel participating in political and certain other events while in uniform, and the Security Officer will insure DLI unit commanders emphasize military regulations governing participation in such functions to their units.

III. TYPES OF SUPPORT

1. GENERAL: This section discusses the various types of OPSEC support that are available within USAINSCOM. It should be noted that operations security is a command responsibility. Therefore, any improvements in the supported commands' OPSEC posture must be accomplished by the supported commander. USAINSCOM is unique in that the present organization integrates many of the counterintelligence/security skills that formerly were assigned to separate Army commands. As such, the Commander, USAINSCOM, has the capability to conduct a multidisciplined security evaluation of a project, activity or facility. With the divergence of skills integral to the USAINSCOM organization, the majority of problem areas that have been historically associated with OPSEC can be addressed, and with the multidisciplined approach, USAINSCOM units are able to assist supported commanders by evaluating their OPSEC posture and recommending means of improvement. This should enable the achievement of a much better security posture. The following paragraphs describe the types of support which USAINSCOM units provide.

2. [redacted] PROGRAM (DOSSP):

2-1. The DOSSP Concept: The DOSSP is a systematic, ongoing, dynamic approach to providing the local commander, operations security officials, project managers and security managers of US Army installations/units/activities/projects with meaningful operations security support in the form of timely, accurate, all source intelligence information pertaining to the real-time, multidisciplined threat posed by hostile intelligence; observed vulnerabilities of the supported element to that threat; and recommendations for appropriate corrective action to enhance operations security. This program is based on a Covering Agent (CA) in an overt continuous role of acquiring information about the supported activity and the threat thereto and providing it to the supported activity in a timely manner, while concurrently recommending practical "fixes" to reduce observed vulnerabilities.

2-2. Responsibilities: Implementation of the Dedicated Operations Security Support Program is the responsibility of each individual field element (RO/FO/Detachment) within the policies provided by the HQ, USAINSCOM. Responsibility for supervision, guidance, and comprehensiveness, rests with the Field Offices, Detachments, and Battalions within their respective areas of responsibility. Group Headquarters will provide guidance, as appropriate, monitor the overall program, acquire and disseminate threat data, and, in the case of certain key projects/activities which stretch beyond local boundaries, will provide centralized management of the overall DOSSP effort.

2-3. Target/Project Selection: Determination of who should be a recipient of DOSSP support is a continuous process of initiative, investigation, and evaluation. Such documents as the ACSI Sensitive Installation and

Page 2353 of 3957

Unit List and other sensitive activities listings are helpful, but not comprehensive. Each field element must do all within its capabilities to insure they are aware of all significant Army activities in their AOR. Once this grasp of the local environment is obtained, prioritization based on available manpower, desires of supported activities, information from intelligence channels, and perceived security sensitivity of the supported activity is made to determine if DOSSP support is appropriate. Security sensitivity is the most important aspect in determining if an activity requires support. Determination of security sensitivity must be based on the importance of the activity to US national security as well as the potential benefit to be derived by a hostile element if they were to obtain details about the activity.

2-4. Covering Agent Functions:

a. Threat: The Covering Agent must be an expert in the threat to the activity he has been detailed to support. This can be accomplished only by thorough study of national threat data, review of periodic intelligence updates, and liaison with local, state, and federal agencies, as well as their foreign equivalents, where appropriate, in order to develop local threat. Refinement of this threat to manageable size is based on a thorough knowledge of the supported command.

b. Knowledge: OPSEC support to an activity is predicated upon a thorough knowledge of that activity. There is no easy way to obtain this knowledge other than extensive research into the organization's mission, functions, and organization. An initial step in this direction is the reading of Army Regulations and Field Manuals pertaining to the activity. Briefings from activity personnel, study of organization and functions manuals, test plans, contingency and operations plans, and related documents are the means for building a comprehensive data base. Even after building this initial base, a systematic plan for obtaining data on an on going basis should be instituted, i.e., daily bulletins, test schedules, briefings, and test plan changes. While expertise in SIGSEC and IMAGERY Security by CI Agents is not required, familiarity with basic concepts is. A primary goal of the USAINSCOM OPSEC Support Program is to provide Army elements a single point of contact for obtaining MI support, be it SIGSEC, IMAGERY Security, or Counterintelligence.

c. Execution: Success in the OPSEC support area is based on the willingness of the covering agent to cast himself in the role of an all source agent and his innovative application of investigative skills in developing threat and vulnerability data, use of deductive reasoning, common sense, and gaining the confidence and respect of the personnel of the supported command. If the confidence of workers at all echelons of the supported command can be gained, their willingness to provide candid assessments of vulnerabilities within the activity will become the Covering Agent's best asset. The CA may know a lot about an activity,

Page 2354 of 3957

but the actual workers know a great deal more. Their experience makes them much more able to relate security weaknesses if they appreciate the threat.

d. Recording: Methodical recording of threat, vulnerabilities, unusual incidents, ideas, and recommendations is essential in building a successful DOSSP. This allows the CA to evaluate comprehensiveness of local hostile intelligence targeting, determine patterns, and fit together isolated incidents, and provides continuity of support as personnel are transferred. ~~A sample workbook is included as figure 1.~~

e. Reporting: Other than the maintenance of workbooks, no formal reporting requirements are imposed on covering agents except in extenuating circumstance of intense, critical stages of support. CA's will keep the chain of command informed of significant activities.

IASO-SA

SUBJECT: Report of Internal Counterintelligence Program (ICIP) Operation (U)

HQDA (DAMI-CIC/Ms Brannan)

DEPARTMENT OF THE ARMY
Headquarters, 902d Military Intelligence Group
Fort George G. Meade, Maryland 20755

902d MI Group Pamphlet
No. 381-3

22 April 1976

Military Intelligence
DIRECT SUPPORT COMPREHENSIVE COUNTERINTELLIGENCE PROGRAM (DSCCP) (U)

1. (U) REFERENCES: See APPENDIX A.

2. (U) PURPOSE: This pamphlet establishes policy, guidance, and standardized procedures for the conduct of all-source, multi-discipline counterintelligence support within the 902d MI Group's area of operation.

3. (U) GENERAL:

a. The Commander, 902d MI Group, has the responsibility to notify commanders of Army installations and units in the group's area of operation when:

(1) Any situation or condition exists that poses a threat to the internal security of that Army element.

(2) Any situation exists that might adversely affect the commander's capability to perform his mission.

(3) Information indicates a probable employement of military resources to counter a threat to the installation.

In order to acquire information of situations or conditions that may pose a threat to the supported commander, field elements must aggressively seek it and not wait for it to be reported through normal sequence of events. This is particularly essential for those units/installations declared to be critical sensitive.

b. The DSCCP is one of a series of graduated intensity counterintelligence programs designed to provide the proper coverage based on the security vulnerability of a particular installation. In relationship to other graduated counterintelligence programs listed in USAINTA Regulation 381-100, the DSCCP would, in certain instances, serve as a means of identifying the need for programs of greater intensity such as SVAs, or SAVEs, or, in other instances, may serve as follow-up support subsequent to such intensified services. It provides the broad spectrum of coverage to include a multi-discipline approach with provisions that the information gathered be reported expeditiously to the responsible commander. The program systematically focuses on providing threat information on the most critical area within the target installation in order to provide the required information to the supported commander.

c. This program is not synonymous with, nor is it identifiable with, the Internal Counterintelligence Program, Special Operations as defined in FM 30-17A, or the Special Covert Operational Personnel Insertion (SCOPI) as defined in USAINTA Regulation 381-100.

4. (U) CONCEPT:

a. The Direct Support Comprehensive Counterintelligence Program (DSCCP) is an overt, dedicated counterintelligence Security support program with the objective of detecting or anticipating situations and factors from any source (HUMINT/SIGINT/PHOTINT) which are or may become detrimental to the security posture of the supported installation. It employs a Direct Support Special Agent (DSSA) in an overt continuous role of acquiring information and providing it to the commander in a timely manner, while concurrently providing sound recommendations for the reduction and/or elimination of security hazards, vulnerabilities on threats posed by hostile factors.

b. The DSSA obtains the required information from overt investigative activities and from a number and variety of sources and contacts within and in the vicinity of the supported installation. Confidential sources are not utilized. He is fully supported in this task by the intervening echelons at Field Offices, Group, and USAINTA.

c. The DSCCP is a complementary service provided to the supported commander to assist him in improving the security posture of his installation. It is not intended to duplicate nor to usurp the functions and responsibilities of the G-2 or of the Security Manager.

5. (U) RESPONSIBILITIES:

a. The Commander, 902d MI Group, is the approving authority for all DSCCP operations conducted within the group's area of operation.

b. The S3, 902d MI Group is responsible for the following:

(1) Coordinating the selection of units/installations as candidates for DSCCP with the appropriate USAINTA staff elements.

(2) Monitoring DSCCP operations on a continuing basis and periodically informing appropriate USAINTA staff elements of their progress.

(3) Conducting an annual review of each DSCCP operation to determine if it is still necessary and if so, to asure that it remains viable.

c. Field Office Commanders are responsible for the following:

(1) Initiating proposed DSCCP operations for installations located within their areas of operation.

UNCLASSIFIED

(2) Conducting DSCCP operations within their area after approval by the Group Commander and coordination with the supported commanders.

(3) Designating the DSSA for each DSCCP operation, providing follow-up support, and arranging for DSSA clearance and access to compartmented information as required.

(4) Briefing of the supported commanders on the results of DSCCP operation at regular intervals per mutual agreements.

(5) Establish procedures to maintain continuity of the program during absences of the DSSA. When possible, an alternate DSSA will be assigned.

(U) PROCEDURES AND SCOPE:

a. (U) The designation of installations or Army elements as candidates for the DSCCP will be a coordinated action between the Field Office Commander and the supported commander. In some cases, the action may be directed by the Group Commander or USAINTA following a request for special counterintelligence support from a major commander. Regardless of the origin of the request, DSCCP operations will always be conducted with the full consent and knowledge of the supported commander.

b. (U) The selection of installations to be considered for the DSCCP must be discriminatory and based on a genuine need for this manpower intensive service in order to avoid over-commitment of assets. The target installation must be one that is on the ACSI Sensitive Installation and Unit List (SIUL) and one that is a potential or actual target of hostile intelligence services. It is recognized that some field offices and resident offices have numerous sensitive installations in their area, many of which may be categorized as critical. Therefore, it is essential that each FO/RO maintain a listing of these installations in order of priority. In determining the order of priority, factors such as mission sensitivity, and impact of compromise on the security of the United States, etc., will all have to be analyzed and a value judgement must be made based upon actual knowledge of the local conditions, as to which installation has a greater need for special support. The installations heading the list will get first consideration.

c. (U) Proposed concept will be submitted to the Group Commander by letter for approval. The letter will indicate the installation commander's concurrence in the program. The concept will contain a listing of missions, sensitivities, and those internal and external factors which may pose a threat to the installation. Vulnerabilities to human sources,

REGRADED UNCLASSIFIED
ON SEP -5 1997
BY CDR USAINSCOM FOI/PO
AUTH PARA 1-603 DoD 5200.1-R

communications intercept, overhead and ground photography, and other appropriate technical/scientific factors will be included if known. This information will be extracted from the target analysis (Para 7a) or from the SVA if one has been completed. The concept must address actions to be taken to detect and counter these threats.

d. (U) Occasional expenditures of ICF in support of this program is authorized and will be processed in compliance with the provisions of AR 381-141 and USAINTA Regulation 381-1. Recurring expenditures will be supported by a formal request for authority if such expenditures are anticipated.

e. (U) The conduct of investigations of and storage of information concerning persons and organizations not affiliated with the Department of Defense are prohibited unless authorized under the provisions of AR 380-13.

7. (U) GUIDELINES:

The actions listed below are considered to be minimum essential for the implementation of this program and are not to be considered as all-encompassing. They should be modified as appropriate to meet situations and needs peculiar to the supported installation. Common sense and experience will likely dictate additional or supplementary means to be employed in order to successfully attain the objective.

a. (U) Conduct a target analysis of the unit/installation to identify, in order of priority, the most critical and vulnerable areas and the multi-discipline threats to which they are exposed. Reference will be made to the following: USAINTA Security Support Bulletins, "THREAT" Manuals, completed SVA/SAVE Reports, CI Survey and Inspection Reports, PM/MP Crime Statistics and Incident Reports, and Communications Security Reports, when available and applicable. The original copy of the analysis will be maintained at the FO/RO level. Appropriate data will be extracted and included in the initial Quarterly Progress Report. The analysis should be reviewed and updated periodically in subsequent Quarterly Progress Reports.

b. (U) Assign a mature, experienced MI Special Agent as a Direct Support Special Agent (DSSA) to provide all-source direct support to the supported commander or his designated representative. The DSSA must become intimately knowledgeable of the supported command's mission, functions, security status and vulnerabilities. As the program will be overt in nature, the DSSA will be known as the primary USAINTA point of contact to all within the supported units/installations. The DSSA will require a TOP SECRET clearance and an SI/SAO special access.

REGRADED UNCLASSIFIED
ON SEP -5 1997
BY CDR USAINSCOM FOI/PO
AUTH PARA 1-603 DoD 5200.1-R

22 April 1976

c. (U) (~~S~~) The task of the DSSA is to develop a sufficient number of sources of information to provide the best possible coverage to the unit/installation and personnel of the element to detect security vulnerabilities, and make sound recommendations for their reduction and/or elimination. The DSSA should work closely with the security manager to coordinate appropriate matters and to avoid duplication of effort. However, care should be taken not to duplicate or usurp functions and responsibilities rightfully assigned to the security manager.

(1) Human sources of information will include Conventional Sources (Incidental, Casual, and Official) and Liaison Contacts as described in Chapter 6, FM 30-17. Confidential Human Sources will not be utilized. Anonymity may be provided through the provisions of the Privacy Act of 1974 when the source so requests. The association between the DSSA and Conventional Sources or Liaison Contacts will not normally be classified.

(2) Maximum use will also be made of Documentary and Technical/Materiel Sources to include, but not be limited to, SATRAN Messages, Department of the Army intelligence publications and/or bulletins; USAINTA Security Support Bulletins and "THREAT" Manuals; SAVE/SVA reports; Military Police Reports, and Serious Incident Reports. Special attention should be paid to message traffic concerning alerts, advisories or warnings concerning events or situations affecting the supported command.

d. (U) (~~S~~) A contact card file will be maintained at the supporting office to identify conventional sources and liaison contacts. This file will be integrated into the existing contact card file already established for use in the routine mission of the FO/RO. It must be readily available for DSSA personnel at all times. Individual cards will be annotated when the contact is in support of a specific DSCCP operation. LACs will be conducted on casual sources with the results reflected in the contact card file.

e. (U) (~~S~~) Consideration should be given to conducting a systematic review of the dossiers of personnel occupying key and sensitive positions to insure that all such personnel have been properly cleared and to determine if unresolved security matters exist. This issue will be discussed with the supported commander if such a review is deemed necessary, the DSSA should recommend that the commander undertake the action. If the commander requests that the review be conducted by the DSSA, then the matter will be referred to group headquarters where resolution will be made in conjunction with the appropriate USAINTA staff elements. The DSSA may assist the supported command in the review of dossiers but may not take any investigative action to resolve issues. He will advise the supported command to submit requests to USAINTA whenever investigative action is indicated.

f. (U) Reporting of Information:

(1) (U) To the local commander: Information of counterintelligence interest affecting the security posture of the unit/installation will be reported to the supported commander or his designated representative in a timely and complete manner. The information may be reported orally, by Agent Report format, or by Summary of Information (SOI) format, as appropriate. While most items of information will be passed on an oral basis only, there may be certain instances when the commander will desire written reports from the DSSA to be later attached as backup information to his Request for Investigation. In these instances, ARs containing the adverse allegation may be passed when the full consent of the sources of the information has been obtained. However, when a source of information desires confidentiality, to protect the source, the DSSA can then pass in the information only on an oral basis or by SOI format. Regardless of the manner in which the information was passed to the supported command, a report of the information provided to the supported command will be summarized in the Quarterly Progress Report to this headquarters with an indication of the actions taken by the supported command (see Para 7h below).

(2) (U) Other: Information of counterintelligence interest to the intelligence community or other agencies will be reported in accordance with established procedures utilizing normal reporting vehicles such as oral reports, Agent Reports, Spot Reports or Summaries of Information as appropriate. Information reports will be classified according to their content. Such reports will indicate when and to whom the information was passed and what action the command has taken or plans to take. Subject blocks, special warning notices and Privacy Act caveats, etc., will be those utilized in established investigative activity procedures. (AR 381-20 and USAINTA Reg 381-100).

(3) (U) When fragmentary information of counterintelligence interest is initially surfaced, the DSSA will attempt to determine whether or not the information is credible prior to reporting it to the supported Commander. Preliminary checks may be made only to the extent authorized in para 3-6, USAINTA Reg 380-100. Should this prove to be insufficient to establish the credibility of the information, the DSSA will then refer the matter to group headquarters for coordination with USAINTA. Credible information concerning a member of the supported command should be used to support a formal Request for Investigation to USAINTA.

(4) (U) The supported commander or his designated representative will be orally briefed on all items of threat information concerning his command, or be provided written reports as appropriate. Examples of the types of threat information include satellite overflights, Soviet bloc

REGRADED UNCLASSIFIED
ON SEP 5 1997
BY CDR USAINSCOM FOI/PO
AUTH PARA 1-603 DoD 5200.1-R

country commercial overflights, communications intercept capabilities/ vulnerabilities from air, ground or water, personnel security vulnerabilities and others as listed below. Depending upon the source of the information and its previous distribution within the intelligence community, the information may be passed laterally or to higher echelons in accordance with established reporting requirements. All information gleaned from the operation will be briefly summarized in the Quarterly Progress Report.

g. (U) A list of EEI will be developed by the DSSA in order to focus specialized coverage on the specific requirements of the local situation and the supported commander. Examples of EEI are attached at APPENDIX B. It should be noted that the EEI contain items of specific interest to the supported commander and other items that pertain to lead material for use by the US Army intelligence community. A copy of the developed EEI list will be attached to the initial Quarterly Progress Report.

h. (U) A Quarterly Status Report in the format contained at APPENDIX C will be submitted to Group Headquarters no later than 10 working days following each calendar quarter. The first report will be due after the completion of the first full quarter of operation after initiation. The report should reflect the developments and progress of the operation, problems encountered, information obtained during the reporting period, future actions contemplated and lessons learned or recommendations as appropriate.

8. (U) Reducing Vulnerabilities: Once a security weakness or hazard has been identified, the DSSA then has the responsibility to make sound recommendations for corrective actions to be taken by the supported commander to reduce or eliminate them. In making these recommendations, the DSSA must use good judgement based upon his background and experience, cost verses absolute security, knowledge of similar instances, common sense, and an intimate knowledge of those technical and/or specialized security services and/or investigations available to the supported commander from other USAINTA elements. Each corrective action must be viable, made on its own merit, be practical and be within the capability of the supported command. USAINTA Security Support Bulletins contain excellent examples of "quick-fix" solutions. In those rare instances when corrective actions cannot be accomplished due to cost restrictions or limited resources available to the command, the commander must be made aware of, and accept the possible security risk(s) involved.

9. (U) It is visualized that situations, incidents or conditions may be uncovered which could have serious deleterious effect on the security

REGRADED UNCLASSIFIED

BY CDR USAINSCOM FOI/PO
AUTH PARA 1-603 DoD 5200.1-R

~~CONFIDENTIAL~~

posture of the installation and could not be resolved through the techniques of the DSCCP. In these cases, the matter should be expeditiously referred to Group Headquarters where it will be brought to USAINTA's attention for resolution, considering ICIPs, SCOPIs, Special Operations, or other more sophisticated methods.

10. (U) The application of the DSCCP to a supported installation is a special effort and will probably require the services of the DSSA on a near full time basis with additional manhours of support furnished by FO and Group Headquarters. Consequently, FO Commanders and RO SAICs should proceed with caution in offering this service to commanders to prevent over-extending their resources. Nevertheless, the DSSA approach of the DSCCP is sound and could well be applied to other installations in the area of operations but to a much lesser degree than in the DSCCP. This should be done as a routine matter and no formal approval is required. Thus, one MI Special Agent could become the DSSA to several installations of lower priority.

11. (U) This pamphlet provides policy and guidance for 902d MI Group personnel in the conduct of all-source, multi-discipline counterintelligence support within the area of responsibility of the 902d MI Group. It complements existing US Army Regulations, USAINTA Regulations and USAINTA policy and guidance. Nothing in this pamphlet shall be construed to contravene or to be in conflict with existing US Army or USAINTA policy. In the event that possible conflicts may arise, the provisions of existing US Army and/or USAINTA policy will apply. Any questions pertaining to possible conflict of the provisions of this pamphlet with existing policy will be addressed to this headquarters, ATTN: MIIA-GPB-AC, for further staffing with appropriate USAINTA staff elements. Comments and recommendations are encouraged and should be submitted on DA Form 2028 (Recommended Changes to Publications) to this headquarters for consideration and staffing.

APPENDIX B TO 902D MI GROUP PAMPHLET 381-3

ESSENTIAL ELEMENTS OF INFORMATION (EEI)

1. (U) GENERAL: In devising EEI applicable to the supported installation, each one of the multi-discipline threats must be examined in conjunction with the mission and situation of the particular target. The actual or potential vulnerabilities thereby conceived become EEI affecting the supported installation. Since each installation has its own specific situation, it is imperative that the DSSA work very closely with a representative of the supported installation in order to arrive at an EEI listing tailored to the specific needs of the command. The references listed at APPENDIX A provide background information and guidance in devising EEI. Many of the areas covered by these references, which heretofore have been of little concern to the Special Agent, are now essential elements of knowledge to the DSSA if he is to successfully accomplish his mission under the DSCCP concept. This is particularly necessary in the areas of SIGINT, PHOTINT, OPSEC and Computer Security. Listed below are sample EEI for each category. These EEI are basic and are only a partial listing provided as an aid in developing a list peculiar to the supported command. Some of the items may not be germane to every DSSA but are included as nuclei for possible development of new or related ideas. The final EEI list prepared by the DSSA should include the source or sources that can provide the required information.

2. (U) HUMINT: The following elements are those normally attributed to collection or exploitation by human intelligence sources. The information will usually be obtained by various HUMINT sources, personal observation by the DSSA and liaison contacts:

a. HOIS subscriptions or regular acquisition of local and post newspapers and periodicals. Sources: LNO contacts and USAINTA.

b. Deliberate compromise of classified information or unauthorized release of military information to representatives of foreign governments (ARs 380-5, 380-10, 381-12 and 381-12-1)

c. Public information releases and local newspaper articles revealing unclassified but useful (to HOIS) information regarding the command.

d. Theft, suspected theft, or unauthorized reproduction of classified documents and or material.

e. Reported or suspected blackmail or coercion of individuals employed within the supported command.

REGRADED UNCLASSIFIED
ON SEP -5 1997
BY CDR USAINSCOM FOI/PO
AUTH PARA 1-603 DoD 5200.1-R

~~CONFIDENTIAL~~

(U) CONFIDENTIAL

f. Actual or attempted physical breaches of restricted area perimeter security, external or internal.

g. Early detection of persons whose activities and/or character weaknesses may render them vulnerable to hostile intelligence exploitation. Suitability factors may include:

(1) Excessive indebtedness or recurring financial difficulties.

(2) Unexplained affluence.

(3) Conduct rendering the individual vulnerable to pressure, such as homosexual, criminal or immoral acts.

(4) Excessive use of alcoholic beverages or improper use of drugs or narcotics.

(5) Mental or emotional instability or history thereof.

(6) Those who attempt to commit suicide.

(7) Drastic changes in behavior to indicate possible unexplained pressures being brought to bear.

h. Personnel who regularly and voluntarily work during non-duty hours when unobserved access to classified data is possible.

i. Sudden unexplained or inadequately explained absences from work.

j. Membership in, or association with members of organizations constituting a local threat against the US Army as defined in AR 380-13.

k. Unsolicited correspondence from individuals, organizations or addressees known to be a threat to the US Army.

l. Allegations or denunciations of espionage or sabotage on the part of sensitive installation personnel.

3. (U) PHOTINT: This pertains to intelligence obtained by means of photography, mainly through HOIS satellites or HOIS commercial aircraft. Also included must be threats posed by hand-held cameras operated from low-flying private aircraft and ground-level photography conducted from areas outside the perimeter of the installation. Photography from seaborne platforms should be considered at installations located near international waters. Sources of information for this type of data are documentary sources such as SATRAN messages, schedules of tests, operations and troop movements, as well as results of liaison contacts and personal observations. Some sample EEI are as follows:

REGRADED UNCLASSIFIED
ON SEP -5 1997
BY CDR USAINSCOM FOI/PO
AUTH PARA 1-603 DoD 5200.1-R

CONFIDENTIAL

Page 2369 of 3957

(U) CONFIDENTIAL

a. Following activities during periods of scheduled overflights by HOIS satellites and commercial aircraft:

(1) Large and significant training exercises.

(2) Testing of equipment and/or techniques in the open.

(3) Uncamouflaged new or sensitive equipment.

(4) Other significant movements and activities.

(5) Concentration of transportation equipment, i.e., transports, etc.

b. Build up of major item stockpiles in the open.

c. Gradual build up of facilities at a test site.

d. Repeated violation of air restricted zones by commercial/private planes.

e. Appearance of private aircraft during classified, or significant tests/demonstrations.

f. Placing, operating or testing of new, significant or classified equipment in areas exposed to the public.

g. Sudden appearance of camera-carrying "tourists" in the vicinity, coinciding with the scheduling of new, unusual and/or classified activity.

h. Unobstructed windows and apertures in areas where classified matters are handled, permitting observation and photography from uncontrolled areas.

i. Foreign vessels, particularly from East Bloc Countries, appearing off-coast of installations near international waters.

4. (U) SIGINT: Signal intelligence is derived from the intercept and analysis of communications, COMINT, and from communications electromagnetic radiations, ELINT. HOIS SIGINT collection against US facilities is accomplished from air-borne, sea-borne, and land-based platforms. HOIS capabilities in this field are described in the USAINTA Threat Manual and additional information as to specific threat to the supported installation may be found in reports of SVAs and SAVEs and/or requested from USAINTA. The field of SIGINT is a very complex and specialized one. Adequate protection of a command/installation from HOIS SIGINT collection requires

REGRADED UNCLASSIFIED
ON SEP -5 1997
BY CDR USAINSCOM FOI/PO
AUTH PARA 1-603 DoD 5200.1-R

CONFIDENTIAL

[redacted]

the application of Signal Security (SIGSEC) which includes Communications Security (COMSEC), and Electronic Security (ELSEC). COMSEC measures are applied to telecommunications systems and has four components; crypto security, physical security, transmission security and emmission security. ELSEC pertains to protective measures applied to electromagnetic radiation of non-communications equipment and systems to prevent the interception, analysis or exploitation of those radiations by foreign intelligence. The DSSA must become sufficiently familiar with the above subjects in order to recognize vulnerabilities, and know when to recommend a request for technical assistance. References 1h, 1, p, q, r, s, and 5d and e in APPENDIX A will provide additional information. Furthermore, the DSSA must work closely with the staff element having responsiblity for SIGSEC of the supported installation. The EEI selected will be the type that can be fulfilled by human sources, preferably located in communication/electronics work areas. Some EEI common to SIGINT are located in para 1c, Appendix to AR 530-1. Other sample EEI follow:

a. Conducting tests on new or sensitive radars and other non-communication emmitters within range of land based, air-borne or sea-borne HOIS ELINT platforms.

b. Installing and operating electrically operated, information-processing equipment which handles classified information without the application of compromising emanations control measures.

c. Poor telephone security to include:

(1) Discussion of classified matters over Autovon and commercial telephone systems.

(2) Discussions of upcoming events which can provide tipoffs to classified activities.

(3) Use of double talk in reference to classified messages.

(4) Reading/quoting verbatim portions of classified matters.

5. (U) OTHER EEI: The following items are of interest to the US Army intelligence community and will be forwarded to this headquarters by Agent Report format for appropriate action. A statement in Agents Notes will indicate if and how the information has been reported through other appropriate channels. As the information will be passed to USAINTA for possible exploitation bt the Special Operations Detachment or the Director of Operations as appropriate, the Agent Reports will be classified CONFIDENTIAL-NO FOREIGN DISSEM. Normally this information is not passed to the local commander other than to insure that other proper reporting

[redacted]

procedures are being followed by the command.

a. Identification and extent of foreign contacts of military and DOD civilian personnel, with emphasis on Soviet bloc countries.

b. Intended foreign travel of military or DOD civilian personnel to Soviet bloc countries or attendance at social or official functions at which Soviet bloc countries are present.

c. Foreign business or professional connections and the extent thereof of military and DOD civilian personnel and their families, with emphasis on Soviet bloc countries.

d. Solicitation by foreign national or organizations of personal or official information through official or unofficial channels.

e. Invitations by non-US Government organizations or individuals to members of the supported command to Participate in conferences or symposia or to submit papers for publications in professional journals on activities related to their government employment.

APPENDIX C TO 902D MI GROUP PAMPHLET 381-3

DSCCP QUARTERLY PROGRESS REPORT

1. (U) IDENTIFY: (Name of 902d MI Group Field Element providing support).

2. (U) SUPPORTED COMMAND: (The activity(ies) receiving the support and the major command(s) involved.)

3. ( ) TARGET ANALYSIS: (In the initial report summarize the results of target analyses conducted for all activities, installations, or separate elements designated and included in the program, by order of priority of support. Subordinate elements large enough to be designated sub-targets will be listed in subparagraphs. In subsequent reports, indicate only changes as they occur.)

4. ( ) QUARTERLY BRIEFING OF SUPPORTED COMMAND

a. Circumstances: In brief narrative form, cite date(s), identities of all persons present, and subjects discussed and results of the briefing(s).

b. Recapitulation of Operational Progress During the Period: In as many subparagraphs as may be required, cite significant developments as pertain to development of the program, improvements in target coverage, and any operational readjustments made during the period. In citing specific items of interest, identify each by making reference to the appropriate reports made during the reporting period which contained details of the topic discussed with the commanders, if applicable.

c. Significant Counterintelligence Information Developed: In as many subparagraphs as may be required, cite identities of personalities, incidents, or groups discussed with reference to the report previously submitted.

5. ( ) INFORMATION SUBMITTED:

a. To the local commander and actions implemented or taken as a result:

Subject	Type Information Developed	Action Taken	Date of Action

b. To the intelligence community;

Subject	Type Information Developed	To whom reported

6. ( ) COMMENTS, REMARKS AND RECOMMENDATIONS:

In this paragraph, indicate any general remarks or indications of special

879

Page 2373 of 3957

interest shown by the supported command that are not covered in above paragraphs. These remarks should reflect the commander's assessment of the viability of the program, whether it is meeting the objectives and achievements as he sees them, and any problems and/or recommendations. Also indicated the extent with which the commander or his representative has cooperated with the FO/RO and/or this group and any pertinent remarks which could serve to improve the DSCCP support to the command. Where problem areas have been encountered, findings and recommended solutions will be provided. Lessons learned should be included to assist in the planning and implementation of other operations. A statement will be entered as to whether any information concerning non-affiliated DOD civilians or organizations was reported (AR 380-13). If affirmative, reference specific report or attach copy. Utilize subparagraphs to explain or amplify information or data reported.

NOTE: Classify each paragraph according to its content. Because of the distribution of this report, care must be taken to insure that the contents of the report do not reveal SI/SAO access material. An example of this would be to include the Statement "three items of PHOTINT information, reference messages_____,_____, and_____, were received and passed to the supported command. Appropriate actions were taken", without revealing the SI/SAO information contained within the reference messages.

2. Attached at TAB B are the Quarterly Summaries on Lentil Monkey (U) for FY 78.

3. Attached at TAB C is an FBI report on an individual who [redacted] in 1977 being considered for employment at DLI.

4. In December 1978, discussion with SOD personnel concerning this ICIP revealed that subject ICIP would be terminated in early 1979. As you know, Bob Wright has an action before "higher authority" regarding a change in the definition of surveillance. My concern has been whether or not ICIP violates the definition used in the E.O. The DOD IG appears to be satisfied that it does not. With the termination of Lentil Monkey the question from my concern becomes academic. According to SOD, Lentil Monkey (U) will be replaced with another plan that will be administered by the 902d MIG and will eliminate the area of concern.

OPERATION PLAN LENTIL MONKEY (U) 25 January 1978

INTERNAL COUNTERINTELLIGENCE PROGRAM (ICIP)

1. (U) Mission, Background, Objectives, & Base of Operations

a. Mission. To provide counterintelligence support, security support and operations security support to the Defense Language Institute (DLI), located at the Presidio of Monterey, CA.

b. Background. Ref b designated the Secretary of the Army as Executive Agent for the Defense Language Program and tasked the Department of the Army to control the program. Military Intelligence received the above stated mission. The Commandant, DLI requested by ref j, the implementation of an Aggressive Counterintelligence Program. This program is now known as an Internal Counterintelligence Program (ICIP). A target vulnerability analysis, conducted by the 115th MI Group in March 1968, indicated the request was fully justified. Additionally, information contained in ref h continues to support this determination.

c. Objectives.

(1) To attempt to identify as early as possible specific hostile intelligence collection operations or threats to the DLI to allow neutralization or exploitation of offensive counterintelligence operations of such hostile threats and/or operations.

(2) To identify those activities, practices and/or personnel within DLI that pose potential or existent security threats and to neutralize threats so identified. Specific target areas are identified by priority in Annex B.

d. Base of DLI Operations.

(1) Project Case Officer (PCO): A day office is located at the US Navy Post Graduate School in proximity to, but, physically separated from the Presidio of Monterey.

(2) Project Liaison Officer (PLO): Presidio of Monterey.

2. (U) Personnel:

a. Project Case Officer.

b. Project Liaison Officer.

OPERATION PLAN LENTIL MONKEY (U)

c. Sources: To be recruited as available from members of the student body, staff and faculty of DLI.

d. Control Personnel: See Annex C, (Knowledgeability List).

3. (C) Cover and Documentation:

a. b1

b. b1

c. b1

d. b1

4. (U) Execution:

a. Concept of Operations:

(1) The ICIP operation will be implemented by the coordinated utilization of overt liaison contacts, conventional sources and confidential sources. Priority of source recruitment will be in accordance with the target priorities established in Annex B and based on expressed or demonstrated needs of the DLI Commandant. The PLO will constantly spot, assess and recruit potential Confidential Sources for utilization in priority target areas.

(2) Each individual and source involved in the conduct or control of this ICIP will be briefed on and comply with current policies and constraints pertaining to counterintelligence operations and other activities as they concern persons and organizations not affiliated with Department of Defense (references a, c, i). Upon recruitment (or earlier if deemed appropriate), each Confidential Source will be briefed on these constraints and will sign a certificate to this effect. A copy of the certificate will be included in the source data forwarded to higher Headquarters.

OPERATION PLAN LENTIL MONKEY (U)

(3) The scope of this operation will not be expanded to cover off-post targets not affiliated with the Department of Defense without prior approval in compliance with reference c.

(4) Activities and duties of the PCO and PLO are contained in reference f. The PLO, in exceptional cases, based on the nature of the DLI environment, may serve as a PCO for selected Confidential Sources.

b. Essential Elements of Information (EEI): Annex D.

c. Target Area: Annex B.

d. Implementation by Phases:

(1) Overt phase is on-going as approved and validated by DA ACSI Letter dated 14 July 1976, subject: Internal Counterintelligence Program (ICIP) (U). The overt phase is a primary responsibility of the PLO.

(2) The objectives of the overt phase are:

(a) Spotting and assessing potential Confidential Sources.

(b) Establishment and maintenance of a professional and cooperative relationship with the DLI Commandant and his staff, with emphasis on the DLI Security Officer and other personnel in key positions involving priority targets.

(c) Further apprising the DLI Commandant of the ICIP, its objectives, capabilities and limitations.

(d) Establishment and maintenance of a liaison link through the DLI Security Officer with the DLI Commandant to facilitate the passage of perishable and critical information.

(e) Accomplishment of selected local investigative requirements relative to both overt and other sources.

(f) Development and maintenance of liaison contacts with local and Federal law enforcement, security, and investigative personnel.

(3) Covert Phase.

(a) The covert phase is initiated upon the recruitment of a Confidential Source and will continue for the duration of the utilization of such source, or until the operation is terminated.

Page 2378 of 3957

OPERATION PLAN LENTIL MONKEY (U)

(b) The objectives of the covert phase, which are the responsibility of the PCO's are:

(1) Development and timely reporting of credible information relating to the detection, neutralization or exploitation of factors or individuals who pose a direct threat to the security of DLI and the United States.

(2) Training and exploitation of in-place Confidential Sources who have placement and access within the selected priority target areas, and who are capable of developing and reporting information not available through overt means.

e. Security Considerations: All personnel will comply with the administrative and operational security procedures set forth in reference f.

f. Technical Requirements: Utilization of technical equipment is not anticipated. If, during the course of the operation, such a requirement develops, supplementary correspondence will be initiated.

5. (C) Communications:

a. b1

b. b1

c. b1

6. (C) Training:

a. b1

OPERATION PLAN LENTIL MONKEY (U)

b. b1

7. (C) Finances and Logistics:

a. b1

b. b1

8. (U) Termination:

a. Termination With and Without Prejudice: Sources recruited for these operations will be terminated when their use to the operation ceases, they show indications of insecure practices which could compromise the operation, they are no longer amenable to control, or the operation is terminated. Circumstances under which termination is effected will determine whether termination is with or without prejudice. Security debriefing and severance statements will be obtained at the time of termination when practicable.

b. Commitments: The only commitments to be made to Sources will be assurance of protection of their identity and of reimbursement of expenses incurred at the direction of the PCO or PLO.

c. Knowledgeability: Knowledgeability of Confidential Sources will be limited to names of the PCO and PLO; vehicles and license plates; meeting sites; training, EEI and other modus operandi acquired by a Source in the course of his utilization in an operation. Knowledgeability of Conventional Sources, witting, or unwitting, will generally be less than that of Confidential Sources; however, they will be met and debriefed whenever practical, with the same operational techniques and procedures utilized with Confidential Sources.

9. (U) Coordination and Liaison:

Coordination of this operation has been effected with the Commandant, DII,

886
886

CONFIDENTIAL

Page 2380 of 3957

and appropriate staff officers. Liaison will continue to be conducted with these officials. Liaison has also been established and maintained with appropriate local and Federal law enforcement and investigative agencies.

10. (U) Reports:

a. Source administration and operational reports will be submitted in accordance with USAINTA Regulation 381-100 & 1 and FM 30-17A. The following reports are required.

(1) Quarterly Status Report (See example in USAINTA Regulation 381-100-1, Appendix A)

(2) Lead Development Report (See example in FM 30-17A, Appendix D)

(3) Contact Report (See example in FM 30-17A, Appendix D)

(4) Agent Report (See example in USAINTA Regulation 381-100, Appendix A)

b. Quarterly status reports will be submitted so as to arrive at Special Operations Detachment, HQ, USAINSCOM, NLT three working days after the end of the reporting period.

ANNEX D: Essential Elements of Information

(U) Consistent with the stated mission and objectives of JCIP LENTIL MONKEY, the following Essential Elements of Information (EEI) are established. These EEI apply to all military and DOD civilian personnel assigned to or associated with DLI activities to include students, permanent party, staff and faculty, and visitors:

1. Identification and extent of foreign contacts and business or professional connections, particularly those with communist bloc countries.

2. Foreign travel, intended or completed, to communist bloc countries; recurring trips to Mexico and Canada.

3. Attendance at social and official functions at which communist bloc country personnel are present.

4. Solicitation by foreign nationals or organizations of official or personal information through either official or non-official channels.

5. Identification of personnel corresponding or associating with communist bloc embassies or receiving unsolicited correspondence from individuals, organizations or addresses known to be a threat to the US Army.

6. Identification of personnel whose activities and character weaknesses render them potentially vulnerable to pressure, blackmail, coercion, and exploitation by foreign intelligence. Such information includes:

a. Excessive indebtedness or recurring financial difficulties.

b. Unexplained affluence inconsistent with income.

c. Commitment or solicitation to commit immoral or illegal acts in CONUS or in foreign countries where such acts could be considered illegal.

d. Drastic changes in or acts of personal behavior to indicate possible unexplained pressures being brought to bear.

e. Excessive use of alcoholic beverages or improper use or abuse of drugs or narcotics.

f. Mental or emotional instability or illness of sufficient seriousness to affect materially the individual's duty performance.

7. Identification of violations of established installation and/or personnel security policy and procedures.

8. Identification of individuals displaying unusual interest in anothers personal and military background and future assignment; attempting to identify individuals on orders to classified and foreign command and general staff assignments; photographing apparently selected individuals.

9. Allegations or denunciations of espionage or sabotage activities.

10. Sudden unexplained or inadequately explained absences from work.

11. Identification of unofficial visitors to DLI.

(C) LENTIL MONKEY: (QSR, 1st QTR FY 78)

a. Location: Defense Language Institute (DLI), Presidio of Monterey, CA.

b. Confidential Source Utilization: Seventeen.

c. Information Obtained or Reported on Non-affiliated Civilians: None.

d. Useful Information Obtained:

(1) During the quarter, sources continued to report contacts between Russian Language Department (RLD) instructors and friends and relatives in the USSR. In addition to written correspondence, packages containing clothing, books and other articles have been sent to individuals in the USSR: sometimes through third parties. One RLD instructor has received both standard and military dictionaries from a friend in the USSR, to include a copy of the Warsaw Pact Military Terminology. An RLD instructor has sent over $4,000, in increments over a period of several years, to friends and relatives in the USSR. The instructor refused to reveal the method/system used to transmit the money that he had borrowed while in the USSR in order to emigrate to the US. An RLD instructor who visited the USSR during the quarter was questioned while there by an individual who identified himself as a Soviet Army officer. The instructor was asked for the names of DLI personnel, students' branches of service, and the purpose of their language studies. The instructor reported that she had refused to answer the questions.

(2) A Polish Language Department (PLD) instructor obtained a visa from the Polish Embassy in London while on leave in July 1977 and proceeded to visit Poland. The instructor failed to comply with DLI regulations in that he did not report his intent to visit a Communist Bloc country and receive the required briefing from the DLI Security Officer. This instructor has taken past trips to Poland, but had always complied with DLI regulations. A PLD instructor who has been employed at DLI since 1955 is reportedly planning to retire in the near future and move to Poland. He stated he would be able to live better in Poland because of lower living costs. This same instructor had visited Poland last May, and had photographed DLI students from the Polish and Serbo-Croatin Language Departments during a class picnic in November 1977. A PLD instructor who last visited Poland in June 1977, was visited by friends, a man and woman, from Poland during late September, early October. The instructor took his guests to the Ft Ord Officers' Club on 1 October 1977.

REGRADED UNCLASSIFIED
ON SEP -5 1997
BY CDR USAINSCOM FOI/PO
AUTH PARA 1-603 DoD 5200.1-R

Page 2390 of 3957

(3) A female instructor of the Serbo-Croatin Language Department (SCLD) has developed a close association with a US Army Captain, and former DLI student, now attending the Yugoslavian Staff College. Since his departure from DLI in June 1977, the instructor has corresponded with the Captain and has sent packages to him for delivery to her relatives in Yugoslavia. She plans to visit the captain during her programmed visit/TDY to Yugoslavia in April 1978. The captain is allegedly gathering data for her that can be used by the SCLD. The instructor, a former Yugoslav citizen, is now a permanent resident of the US, and her husband is a US Army enlisted man stationed at Ft Ord.

(4) An instructor of the Hungarian Language Department (HLD) required his students to complete, in English, a Hungarian visa application as homework assignment. When filled in, the application provides considerable biographic data. The application was printed in four languages, Hungarian, German, French and English.

e. Operational Status:

(1) Seventeen confidential sources were active during the quarter. Four sources were terminated, three due to graduation and one due to unexpected reassignment, and three new sources were recruited. Four other individuals, including one instructor, are currently under assessment as potential confidential sources. In addition to the confidential source coverage, twelve conventional sources also provided coverage at DLI.

(2) During the reporting period, information obtained from all sources, including that acquired from overt liaison activities with other services, resulted in the production of two Summaries of Information, 32 Contact Reports, 48 oral reports to the DLI Commandant, eight Source Lead Development Reports (SLDR), and 109 Agent Reports. A total of 1,320 manhours were expended during the 1st Quarter.

(3) On 20 December 1977, the Project Liaison Officer (PLO) provided the Quarterly Progress Briefing to COL Samuel L. Stapleton, Commandant, DLI, with LTC Richard P. Kelly, XO, DLI and LTC Waldo R. Webb, Security Officer, DLI, also present. COL Stapleton directed that significant information in the briefing also be furnished the Deputy DLI Commandant, COL R. Jansson, USAF. This was accomplished on 21 December 1977.

(4) As a result of the Quarterly Briefing and items presented to the Commandant and his staff as developed by the ICIP during the quarter, the DLI Security Officer denied permission for an ASA enlisted student to reside in the home of an RLD instructor. The instructor has had extensive contacts with individuals in the USSR, reportedly attempted to obtain the release of family members from the USSR, and has had alleged contacts with the Soviet Consulate. The DLI Commandant has tasked the Security Officer to determine what restrictions could be placed on foreign visitors to DLI,

897 REGRADED UNCLASSIFIED ON SEP -5 1997 BY CDR USAINSCOM FOI/PO AUTH PARA 1-603 DoD 5200.1-R

and what actions can be taken against the PLD instructor who visited Poland without complying with DLI regulations. Further, the Security Officer was tasked to follow-up on the visa application homework assigned by an instructor of the HLD. Such assignments appear out-of-line and without academic basis.

(5) Special Operations Detachment, USAINSCOM, is closely monitoring the reports concerning the relationship between the SCLD instructor and US Army Captain. Should substantive information develop as a result of this relationship, necessary investigative or other appropriate action will be initiated.

(C) LENTIL MONKEY: (QSR, 2d QTR FY 78)

a. Location: Defense Language Institute (DLI), Presidio of Monterey, CA.

b. Confidential Source Utilization: Seventeen

c. Information Obtained or Reported on Non-affiliated Civilians: None.

d. Useful Information Obtained:

(1) A Russian Language Department (RLD) instructor revealed that her mother, who resides in the USSR, had been recently questioned by KGB officials when she unsuccessfully attempted to have a manuscript smuggled out of the USSR by an American tourist for delivery to her daughter. The manuscript was allegedly the instructor's translation of some of the works of an ancient Greek philosopher. The tourist, a male student (not further identified), was apprehended and the package confiscated by airport officials. An RLD instructor revealed that while a resident of the USSR he had been approached by the KGB to be an informer. At the time, 1974, the instructor was teaching English language to Soviet Jews. Through the advice of an acquaintance, he allegedly told everyone he knew about the KGB approach and was never bothered by them again. The acquaintance was b6 a former NSA employee who defected to the Soviet Union in 1960. The RLD instructor has been attempting for some time to foster a language teaching method at DLI that he developed while in the USSR at the Pavlov Institute on Physiology. The method has a physiological-psychological basis. Three RLD instructors received unsolicited offers to purchase Soviet publications from an alleged Communist controlled bookstore in New York City.

(2) During a visit to Czechoslovakia this past Christmas season, a Czech Language Department (CLD) instructor mentioned to students that while there she was surveilled by unidentified person(s) on two separate occasions. The instructor had not reported this fact to the DLI Security Officer upon her return as required by DLI regulations. During a DLI sponsored trip to the Stanford University Library, students were approached by an unidentified man and invited to attend a Czech sponsored social function in the local area. An official invitation was later received by the CLD chairman.

(3) A Chinese Mandarin Language Department (CMLD) instructor visited the Peoples Republic of China (PRC) during January 1978, without complying with DLI regulations concerning reporting of such trips. This is the instructor's second visit to the PRC; she had complied with appropriate regulations prior to her first visit.

REGRADED UNCLASSIFIED
ON SEP -5 1997

AUTH PARA 1-603 DoD 5200.1-R

899

(4) According to an unsubstantiated statement of a former Egyptian citizen, an instructor in the Arabic Language Department was reportedly a fund raiser for "El Fatah" and avid supporter of the Palestine Liberation Organization when he resided in Egypt.

(5) Through several instructors in the Hungarian Language Department (HLD), the president of a local Hungarian club requested a student volunteer to present a speech in Hungarian at a forthcoming club ceremony. A USAF enlisted student expressed willingness to present the requested speech.

e. Operational Status:

(1) Seventeen confidential sources were active during the quarter. Four sources were terminated and four new sources recruited. Five individuals are currently under assessment as potential confidential sources. In addition to confidential source coverage, ten conventional sources provided coverage at DLI.

(2) During the reporting period, information obtained from all sources, including that acquired from overt liaison activities, resulted in production of five Summaries of Information, 41 Contact Reports, 49 oral reports to the DLI Commandant and or designated representatives, five Source Lead Development Reports, and 112 Agent Reports. A total of 1448 manhours were expended on the ICIP during the 2d Quarter.

(3) On 13 March 1978, the required quarterly briefing was presented to COL Samuel L. Stapleton, Commandant, DLI. LTC Waldo R. Webb, DLI Security Officer, also attended the briefing. At the Commandant's request, on 20 March 1978, the Deputy Commandant and Executive Officer were also briefed on the progress of the ICIP.

(4) As a result of the quarterly briefing and items reported to the DLI Commandant and his staff as developed by the ICIP during the quarter, the Commandant directed that letters, requiring written replys of explanation, be sent to the DLI instructors who travelled to Communist bloc countries and did not comply with established DLI policy. He further directed the DLI Information Officer to contact the student discussed in para d(5) above, and advise him of applicable DOD, USAF and DLI regulations regarding military personnel participation in off post political rallies and activities. Such appearances, speeches or other participation by DLI staff, faculty and student personnel must be cleared through the Public Affairs Office. The DLI Security Officer was directed to determine what action can be taken concerning instructors whose actions or backgrounds indicate they may be possible security risks (reference para d(1) wherein an RLD instructor revealed contacts with the KGB and a known US defector while residing in the USSR. SOD, USAINSCOM, has been and will continue to closely monitor the instructor's teaching methods and activities.).

a. Location: Defense Language Institute (DLI), Presidio of Monterey, CA.

b. Confidential Source Utilization: Fifteen

c. Information Obtained or Reported on Non-affiliated Civilians: None.

d. Useful Information Obtained:

(1) A Russian Language Department (RLD) supervisor entertained a Soviet citizen as his house guest for a period of over a month. The Soviet citizen, an engineer, was in Monterey awaiting settlement of his uncle's will. He returned to Moscow in mid-April following partial settlement, and has arranged with the RLD supervisor to have remaining funds sent to him through banks in the USSR and Western Europe. An RLD instructor has been selected by the US Coast Guard in Monterey to serve as a Russian Language interpreter when needed in cases involving Russian ships or personnel.

(2) An instructor in the Arabic Language Department (ALD) is reportedly subjecting his students to Palestinian Liberation Organization propaganda.

(3) An instructor in the Polish Language Department (PLD) required students to fill out a questionnaire covering such subjects as the students' military specialty; prior language training; life goals, leisure time activities; and how he/she plans to take advantage of language proficiency in future personal career.

(4) An instructor in the German Language Department (GLD) presented lectures to various GLD classes concerning his recently completed trip to East Berlin and East Germany. The instructor failed to comply with DLI regulations concerning prior reporting of trips to Communist bloc countries.

e. Operational Status:

(1) Fifteen confidential sources were active during the quarter. Five sources were terminated and three new sources recruited. Seven individuals are currently under assessment as potential confidential sources. In addition to confidential source coverage, ten conventional sources provided coverage at DLI.

(2) During the reporting period, information obtained from all sources, including that acquired from overt liaison activities, resulted in production of seven Summaries of Information, 34 Contact Reports, 42 oral reports to the DLI Commandant and/or designated representatives, eight Source Lead Development Reports, and 118 Agent Reports. A total of 1301 manhours were expended on the ICIP during the 3d quarter.

(3) On 22 June 1978, the required quarterly briefing was presented to COL Samuel L. Stapleton, Commandant, DLI. LTC Richard P. Kelly, DLI Executive Officer, and LTC Waldo R. Webb, DLI Security Officer, also attended the briefing.

(4) As a result of the quarterly briefing and items reported to the DLI Commandant and staff as developed by the ICIP during the quarter, the Commandant directed that DLI visitor control procedures be strengthened through greater coordination between the Security and Information Offices. Procedures for the direct, expeditious reporting of the arrival of visitors and monitoring of their activities at DLI are being established. The Commandant directed that a letter of reprimand be sent to the GLD instructor who visited East Berlin and East Germany without complying with appropriate DLI regulations. The Commandant directed the Security Officer to ascertain the details concerning the PLD instructor's requirement for students to complete a questionnaire soliciting biographic, professional and personal information on the students. The Commandant commented that appropriate attention must be paid to the ALD since any attempts to sabotage Arabic language teaching efforts would have serious effect on various US Aid Agreements with Arabic speaking countries. He does not wish to see the improvement in morale and efficiency of the ALD that has occurred over the past few years negated by outside interference by either pro or anti-Arab elements.

(C) LENTIL MONKEY: (QSR, 4th QTR FY 78)

a. Location: Defense Language Institute (DLI), Presidio of Monterey, CA.

b. Confidential Source Utilization: Eighteen

c. Information Obtained or Reported on Non-affiliated Civilians: None.

d. Useful Information Obtained:

(1) Unauthorized visitors to the Polish, Serbo-Croatian and Arabic Language Departments were reported during the quarter. The visitor to the Arabic Language Department (ALD), a newspaperman of unknown citizenship, allegedly plans to write an article about DLI and solicited information from the Public Affairs/Visitor Support Division (PAVSD) after he had already visited ALD.

(2) A student in the German Language Department (GLD) attending DLI in civilian cover status was questioned by a substitute instructor regarding his status, type job, assignment upon graduation, and whether he knew, and/or would be working with a former civilian GLD student now in Germany. To determine if a trend exists or is developing, attempts will be made to ascertain if any special attention or undue curiosity is shown to "civilian" personnel attending language training by the DLI instructors.

e. Operational Status:

(1) Eighteen confidential sources were active during the quarter. Two sources were terminated and eight new sources recruited. Four individuals are currently under assessment as potential confidential sources. In addition to confidential source coverage, ten conventional sources provided coverage at DLI.

(2) During the reporting period, information obtained from all sources, including that acquired from overt liaison activities, resulted in production of three Summaries of Information, 43 Contact Reports, 55 oral reports to the DLI Commandant and/or designated representatives, six Source Lead Development Reports, and 65 Agent Reports. A total of 1142 manhours were expended on the ICIP during the 4th quarter.

(3) On 20 September 1978, the required quarterly briefing was presented to LTC Waldo R. Webb, Security Officer, DLI. A comprehensive briefing on the operation will be presented to the newly assigned (22 Sep 78) DLI Commandant in the near future.

Page 2397 of 3957

(4) Based on information reported to the DLI Commandant and staff during the quarter the following actions were initiated:

(a) During their initial security briefing, it is emphasized to all incoming student personnel that neither DLI language instructors nor their relatives have security clearances. This action was based on information that relatives of insturctors, citizens of Communist bloc countries, have attended social functions sponsored by language departments and met and conversed with students.

(b) The Security Officer and Chief, PAVSD are working together to implement and enforce effective visitor control procedures. Personnel of the ALD, see para d(1), were admonished for permitting a visitor access to that department without first coordinating with the PAVSD.

FOREIGN INFLUENCE

(U) Iranian Influence Efforts Primarily use Online Tools to Target US Audiences, Remain Easily Detectable for Now

(U//FOUO) **Scope:** This *Intelligence In Focus* (*IIF*) is a companion piece to the I&A *IIF*, "Iranian Efforts to Manipulate US Media Narratives," released on 24 February 2021, providing baseline assessments of Iran's attempts to conduct malign influence operations against US audiences.

(U//FOUO) ***We assess that Iran likely will continue to rely primarily on proxy news websites and affiliated social media accounts to attempt sustained influence against US audiences, while we expect intermittent, issue-specific influence attempts via other means (e.g., e-mails).*** We base this assessment on Iran's actions since at least 2008 to build and maintain vast malign influence networks anchored by proxy websites, as well as Iran's attempts to find new avenues to re-launch established malign influence networks after suspension. Tehran employs a network of proxy social media accounts and news websites that typically launder Iranian state media stories (stripped of attribution), plagiarize articles from Western wire services, and occasionally pay US persons to write articles to appear more legitimate to US audiences.

- *(U)* The American Herald Tribune (AHT)—an Iranian Government proxy website established in 2015 that purported to be a genuine media outlet—was seized by the US Government on 4 November 2020 for attempting to covertly influence United States policy and public opinion, according to a DOJ press release. However, AHT by at least 16 November 2020 resurfaced on a Canada-based domain, according to AHT's website. AHT is also known to pay unwitting US persons to contribute to its disinformation campaigns, according to the same website.
- *(U)* The International Union of Virtual Media (IUVM) since at least August 2018 has maintained a network of proxy accounts and websites posing as news sources that attempted to insert Iranian Government narratives into Western target audiences and to denigrate the United States, Western governments, and other regional adversaries, according to reports from a research institute and a social media analysis firm. Since IUVM started, US social media outlets have repeatedly removed its accounts from their platforms for being engaged in pro-Iran information operations and deceiving users; most recently, the FBI in October 2020 seized IUVM's domains, according to the same reports and a DOJ press release. Despite these setbacks, however, IUVM created new accounts and returned to operations, according to these same reports.

(U) Prepared by the Cyber Mission Center. Coordinated with the DHS Intelligence Enterprise (CETC, CIMC, FOD, and ICE).
For questions, contact DHS-SPS-RFI@hq.dhs.gov.

Page 2406 of 3957

- *(U)* Iranian state media-linked Liberty Front Press, created in 2013, claimed to be an independent media organization that published US political news, including content from other proxies such as IUVM and US-based media sites, according to reports from a media outlet, a cybersecurity firm, and a research institute. Liberty Front Press and its network of affiliated proxy news websites published content directly from other sources, and any original content contained poorly written English, according to the same cybersecurity firm report. In August 2018, US social media platforms deactivated accounts associated with Liberty Front Press because of its connection to Iranian state media, according to media reporting. The Liberty Front Press website was officially seized by the FBI in October 2020, according to a DOJ affidavit. The FBI identified over 1,000 domains, e-mail accounts, and social media accounts associated with Liberty Front Press as part of its investigation, according to the same affidavit.

(U//FOUO) ***For at least the next year, we assess that these Iranian-run news websites and affiliated social media accounts targeting US audiences likely will remain easily detectable by the US Government and US social media companies due to Iran's use of thinly masked and often unsubtle promotion of pro-Iranian content.*** We base this assessment on Iran's promotion of pro-Iranian messaging behind a veneer of supposedly otherwise focused pages and the ease at which these pages have previously been identified and removed from US social media platforms and registered domains. While Iranian websites have remained easily detectable to date, if these deceptive outlets improved their obfuscation techniques and replaced obvious pro-Iranian content with divisive anti-US content, these outlets could blend into the information environment and be more difficult to attribute. Thus, it is important for the US Government and social media companies to maintain a close working relationship to continue to detect and uncover Iranian covert influence efforts as they develop and grow in complexity.

- *(U)* In August 2018, a cybersecurity firm made the first major attribution of Iranian proxy accounts attempting to promote political narratives in line with Iranian interests, which directly led to the suspension and removal of over 900 accounts, pages, and groups from US social media platforms, some accounts dating back as early as 2015, according to reports from a cybersecurity firm and social media companies.

- *(U)* In October 2019, a social media company removed several Iran-based pages attempting to hide behind a façade of otherwise focused pages, while pushing pro-Iranian messaging, including a page supposedly supporting Black Lives Matter[USPER], according to a research institute.

- *(U)* In October 2020, a US social media company removed an Iran-based page attempting to conceal its identity and activity, while pushing false claims and unsubstantiated US election-related threats as part of an influence operation, according to a report from the same social media company.

- *(U)* In October 2020, a social media company acted on information provided by the FBI to take down over a hundred accounts appearing to originate from Iran and attempting unsuccessfully to disrupt the public conversation of the first 2020 US presidential debate, according to a report from the same social media company.

Source, Reference, and Dissemination Information

Source Summary Statement	*(U//FOUO)* This product is based on reports from two research institutes, a cybersecurity firm, a social media analysis firm, US social media companies, and press releases from US Government agencies. *(U//FOUO)* We assess that Iran likely will continue to primarily rely on proxy news websites and affiliated social media accounts to attempt sustained influence against US audiences, while we expect intermittent, issue-specific influence attempts via other means (e.g., e-mails). We have **moderate confidence** in our assessment based on reports from sources with a history of credible reporting and corroboration of reporting among a wide range of sources including the US Government and the social media platforms themselves. Our confidence would increase if we saw continued evidence of US detection and disruption of Iranian information operations, and we would re-evaluate this assessment if we discovered Iranian online influence that had previously been undetected for a prolonged period. *(U//FOUO)* For at least the next year, we assess that these Iranian-run news websites and affiliated social media accounts targeting US audiences likely will remain easily detectable by the US Government and US social media companies due to Iran's use of thinly masked and often unsubtle promotion of pro-Iranian content. We have **moderate confidence** in our assessment based on reports from sources with a history of credible reporting and the corroboration of reporting among a wide range of sources. Our confidence would increase if we saw further evidence of attempts of Iranian obfuscation across multiple platforms and resonating in the US information environment.
Definitions	*(U//FOUO)* **Disinformation:** A foreign government's deliberate use of false or misleading information intentionally directed at another government's decisionmakers and decision-making processes to mislead the target, force it to waste resources, or influence a decision in favor of a foreign government's interests. Disinformation always depends on falsehoods and is sometimes relayed clandestinely for the target to "discover." *(U//FOUO)* **Influence Activities:** The use of covert and overt tools to achieve a foreign government's objectives, sometimes in support of broader influence operations. Activities may be carried out by an array of actors, independently or in coordination. *(U//FOUO)* **Influence Operations:** Broad use of influence activities conducted by various state and nonstate actors, sometimes to achieve specific goals under a larger influence campaign objective.
Dissemination	*(U)* Senior DHS leadership, federal officials, governors, lieutenant governors, secretaries of state, homeland security advisors, fusion center directors and their staff.
Civil Rights and Civil Liberties	*(U//FOUO)* US persons linking, citing, quoting, or voicing the same arguments raised by these influence activities likely are engaging in First Amendment-protected activity, unless they are acting at the discretion or control of a foreign threat actor. Furthermore, variants of the topics covered in this product, even those that include divisive terms, should not be assumed to reflect foreign influence or malign activity absent information specifically attributing the content to malign foreign actors. This information should be considered in the context of all applicable legal and policy authorities to use open source information while protecting privacy, civil rights, and civil liberties.

CISA Guidelines for Countering Foreign Influence	*(U)* CISA defines foreign influence as malign actions taken by foreign governments to spread disinformation designed to manipulate the public, sow discord and ill will, discredit the electoral process, disrupt markets, and undermine the interests of the American people. Recognize the risk: understand how foreign actors try to affect behavior. Question the source: check who produced the content and question their intent. Investigate the issue: search for other reliable sources before sharing. Think before you link: ask yourself why you're sharing, and let your emotions cool. Talk to your circle: talk to your social circle about the risks of spreading disinformation.
Warning Notices & Handling Caveats	*(U)* **Warning:** This document is UNCLASSIFIED//FOR OFFICIAL USE ONLY (U//FOUO). It contains information that may be exempt from public release under the Freedom of Information Act (5 U.S.C. 552). It is to be controlled, stored, handled, transmitted, distributed, and disposed of in accordance with DHS policy relating to FOUO information and is not to be released to the public, the media, or other personnel who do not have a valid need to know without prior approval of an authorized DHS official. State and local homeland security officials may share this document with authorized critical infrastructure and key resource personnel and private sector security officials without further approval from DHS. *(U)* This product contains US person information that has been deemed necessary for the intended recipient to understand, assess, or act on the information provided. It has been highlighted in this document with the label USPER and should be handled in accordance with the recipient's intelligence oversight and/or information handling procedures. Other US person information has been minimized. Should you require the minimized US person information on weekends or after normal weekday hours during exigent and time sensitive circumstances, contact the Current and Emerging Threat Watch Office at 202-447-3688, CETC.OSCO@hq.dhs.gov. For all other inquiries, please contact the Homeland Security Single Point of Service, Request for Information Office at DHS-SPS-RFI@hq.dhs.gov, DHS-SPS-RFI@dhs.sgov.gov, DHS-SPS-RFI@dhs.ic.gov.

SUMMARY

The Cybersecurity and Infrastructure Security Agency (CISA), National Security Agency (NSA), and Federal Bureau of Investigation (FBI) assess that People's Republic of China (PRC) state-sponsored cyber actors are seeking to pre-position themselves on IT networks for disruptive or destructive cyberattacks against U.S. critical infrastructure in the event of a major crisis or conflict with the United States.

Actions to take today to mitigate Volt Typhoon activity:

- **Apply patches for internet-facing systems**. Prioritize patching critical vulnerabilities in appliances known to be frequently exploited by Volt Typhoon.
- **Implement phishing-resistant MFA**.
- **Ensure logging is turned on for application, access, and security logs** and store logs in a central system.

CISA, NSA, FBI and the following partners are releasing this advisory to warn critical infrastructure organizations about this assessment, which is based on observations from the U.S. authoring agencies' incident response activities at critical infrastructure organizations compromised by the PRC state-sponsored cyber group known as Volt Typhoon (also known as Vanguard Panda, BRONZE SILHOUETTE, Dev-0391, UNC3236, Voltzite, and Insidious Taurus):

- U.S. Department of Energy (DOE)
- U.S. Environmental Protection Agency (EPA)
- U.S. Transportation Security Administration (TSA)
- Australian Signals Directorate's (ASD's) Australian Cyber Security Centre (ACSC)
- Canadian Centre for Cyber Security (CCCS), a part of the Communications Security Establishment (CSE)
- United Kingdom National Cyber Security Centre (NCSC-UK)
- New Zealand National Cyber Security Centre (NCSC-NZ)

The U.S. authoring agencies have confirmed that Volt Typhoon has compromised the IT environments of multiple critical infrastructure organizations—primarily in Communications, Energy, Transportation Systems, and Water and Wastewater Systems Sectors—in the continental and non-continental United States and its territories, including Guam. Volt Typhoon's choice of targets and pattern of behavior is not consistent with traditional cyber espionage or intelligence gathering operations, and the U.S. authoring agencies assess with high confidence that Volt Typhoon actors are pre-positioning themselves on IT networks to enable lateral movement to OT assets to disrupt functions. The U.S. authoring agencies are concerned about the potential for these actors to use their network access for disruptive effects in the event of potential geopolitical tensions and/or military conflicts. CCCS assesses that the direct threat to Canada's critical infrastructure from PRC state-sponsored actors is likely lower than that to U.S. infrastructure, but should U.S. infrastructure be disrupted, Canada would likely be affected as well, due to cross-border integration. ASD's ACSC and NCSC-NZ assess Australian and New Zealand critical infrastructure, respectively, could be vulnerable to similar activity from PRC state-sponsored actors.

As the authoring agencies have previously highlighted, the use of living off the land (LOTL) techniques is a hallmark of Volt Typhoon actors' malicious cyber activity when targeting critical infrastructure. The group also relies on valid accounts and leverage strong operational security, which combined, allows for long-term undiscovered persistence. In fact, the U.S. authoring agencies have recently observed indications of Volt Typhoon actors maintaining access and footholds within some victim IT environments for at least five years. Volt Typhoon actors conduct extensive pre-exploitation reconnaissance to learn about the target organization and its environment; tailor their tactics, techniques, and procedures (TTPs) to the victim's environment; and dedicate ongoing resources to maintaining persistence and understanding the target environment over time, even after initial compromise.

The authoring agencies urge critical infrastructure organizations to apply the mitigations in this advisory and to hunt for similar malicious activity using the guidance herein provided, along with the recommendations found in joint guide Identifying and Mitigating Living Off the Land Techniques. These mitigations are primarily intended for IT and OT administrators in critical infrastructure organizations. Following the mitigations for prevention of or in response to an incident will help disrupt Volt Typhoon's accesses and reduce the threat to critical infrastructure entities.

If activity is identified, the authoring agencies strongly recommend that critical infrastructure organizations apply the incident response recommendations in this advisory and report the incident to the relevant agency (see Contact Information section).

For additional information, see joint advisory People's Republic of China State-Sponsored Cyber Actor Living off the Land to Evade Detection and U.S. Department of Justice (DOJ) press release U.S. Government Disrupts Botnet People's Republic of China Used to Conceal Hacking of Critical Infrastructure. For more information on PRC state-sponsored malicious cyber activity, see CISA's China Cyber Threat Overview and Advisories webpage.

TECHNICAL DETAILS

Note: This advisory uses the MITRE ATT&CK for Enterprise framework, version 14. See Appendix C: MITRE ATT&CK Tactics and Techniques section for tables of the Volt Typhoon cyber threat actors' activity mapped to MITRE ATT&CK® tactics and techniques. For assistance with mapping malicious cyber activity to the MITRE ATT&CK framework, see CISA and MITRE ATT&CK's Best Practices for MITRE ATT&CK Mapping and CISA's Decider Tool.

Overview of Activity

In May 2023, the authoring agencies—working with industry partners—disclosed information about activity attributed to Volt Typhoon (see joint advisory People's Republic of China State-Sponsored Cyber Actor Living off the Land to Evade Detection). Since then, CISA, NSA, and FBI have determined that this activity is part of a broader campaign in which Volt Typhoon actors have successfully infiltrated the networks of critical infrastructure organizations in the continental and non-continental United States and its territories, including Guam.

The U.S. authoring agencies have primarily observed compromises linked to Volt Typhoon in Communications, Energy, Transportation Systems, and Water and Wastewater Systems sector organizations' IT networks. Some victims are smaller organizations with limited cybersecurity capabilities that provide critical services to larger organizations or key geographic locations.

Volt Typhoon actors tailor their TTPs to the victim environment; however, the U.S. authoring agencies have observed the actors typically following the same pattern of behavior across identified intrusions. Their choice of targets and pattern of behavior is not consistent with traditional cyber espionage or intelligence gathering operations, and the U.S. authoring agencies assess with high confidence that Volt Typhoon actors are pre-positioning themselves on IT networks to enable the disruption of OT functions across multiple critical infrastructure sectors (see Figure 1).

1. **Volt Typhoon conducts extensive pre-compromise reconnaissance to learn about the target organization's network architecture and operational protocols.** This reconnaissance includes identifying network topologies, security measures, typical user behaviors, and key network and IT staff. The intelligence gathered by Volt Typhoon actors is likely leveraged to enhance their operational security. For example, in some instances, Volt Typhoon actors may have abstained from using compromised credentials outside of normal working hours to avoid triggering security alerts on abnormal account activities.
2. **Volt Typhoon typically gains initial access to the IT network by exploiting known or zero-day vulnerabilities in public-facing network** appliances (e.g., routers, virtual private networks [VPNs], and firewalls) and then connects to the victim's network via VPN for follow-on activities.
3. **Volt Typhoon aims to obtain administrator credentials within the network, often by exploiting privilege escalation vulnerabilities in the operating system or network services.** In some cases, Volt Typhoon has obtained credentials insecurely stored on a public-facing network appliance.

4. **Volt Typhoon uses valid administrator credentials to move laterally to the domain controller (DC) and other devices** via remote access services such as Remote Desktop Protocol (RDP).
5. **Volt Typhoon conducts discovery in the victim's network, leveraging LOTL binaries for stealth**. A key tactic includes using PowerShell to perform targeted queries on Windows event logs, focusing on specific users and periods. These queries facilitate the discreet extraction of security event logs into `.dat` files, allowing Volt Typhoon actors to gather critical information while minimizing detection. This strategy, blending in-depth pre-compromise reconnaissance with meticulous post-exploitation intelligence collection, underscores their sophisticated and strategic approach to cyber operations.
6. **Volt Typhoon achieves full domain compromise by extracting the Active Directory database (`NTDS.dit`) from the DC.** Volt Typhoon frequently employs the Volume Shadow Copy Service (VSS) using command-line utilities such as `vssadmin` to access `NTDS.dit`. The `NTDS.dit` file is a centralized repository that contains critical Active Directory data, including user accounts, passwords (in hashed form), and other sensitive data, which can be leveraged for further exploitation. This method entails the creation of a shadow copy—a point-in-time snapshot—of the volume hosting the `NTDS.dit` file. By leveraging this snapshot, Volt Typhoon actors effectively bypass the file locking mechanisms inherent in a live Windows environment, which typically prevent direct access to the `NTDS.dit` file while the domain controller is operational.
7. **Volt Typhoon likely uses offline password cracking techniques to decipher these hashes.** This process involves extracting the hashes from the `NTDS.dit` file and then applying various password cracking methods, such as brute force attacks, dictionary attacks, or more sophisticated techniques like rainbow tables to uncover the plaintext passwords. The successful decryption of these passwords allows Volt Typhoon actors to obtain elevated access and further infiltrate and manipulate the network.
8. **Volt Typhoon uses elevated credentials for strategic network infiltration and additional discovery, often focusing on gaining capabilities to access OT assets.** Volt Typhoon actors have been observed testing access to domain-joint OT assets using default OT vendor credentials, and in certain instances, they have possessed the capability to access OT systems whose credentials were compromised via `NTDS.dit` theft. This access enables potential disruptions, such as manipulating heating, ventilation, and air conditioning (HVAC) systems in server rooms or disrupting critical energy and water controls, leading to significant infrastructure failures (in some cases, Volt Typhoon actors had the capability to access camera surveillance systems at critical infrastructure facilities). In one confirmed compromise, Volt Typhoon actors moved laterally to a control system and were positioned to move to a second control system.

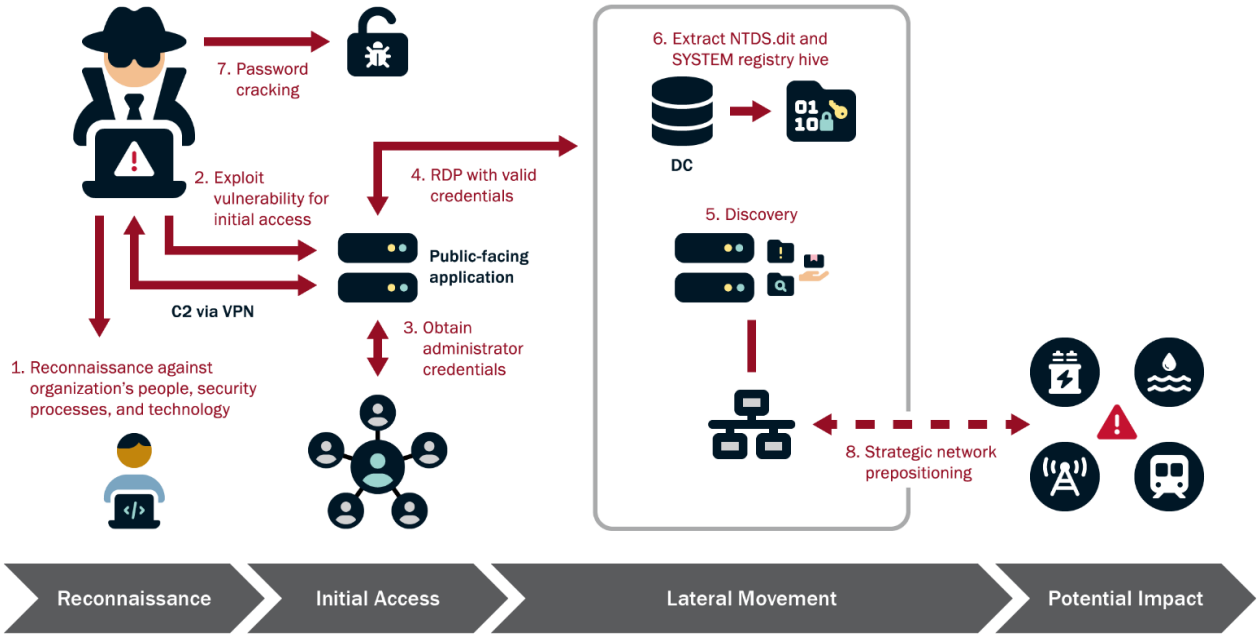

Figure 1: Typical Volt Typhoon Activity

After successfully gaining access to legitimate accounts, Volt Typhoon actors exhibit minimal activity within the compromised environment (except discovery as noted above), suggesting their objective is to maintain persistence rather than immediate exploitation. This assessment is supported by observed patterns where Volt Typhoon methodically re-targets the same organizations over extended periods, often spanning several years, to continuously validate and potentially enhance their unauthorized accesses. Evidence of their meticulous approach is seen in instances where they repeatedly exfiltrate domain credentials, ensuring access to current and valid accounts. For example, in one compromise, Volt Typhoon likely extracted `NTDS.dit` from three domain controllers in a four-year period. In another compromise, Volt Typhoon actors extracted `NTDS.dit` two times from a victim in a nine-month period.

Industry reporting—identifying that Volt Typhoon actors are silent on the network following credential dumping and perform discovery to learn about the environment, but do not exfiltrate data—is consistent with the U.S. authoring agencies' observations. This indicates their aim is to achieve and maintain persistence on the network. In one confirmed compromise, an industry partner observed Volt Typhoon actors dumping credentials at regular intervals.

In addition to leveraging stolen account credentials, the actors use LOTL techniques and avoid leaving malware artifacts on systems that would cause alerts. Their strong focus on stealth and operational security allows them to maintain long-term, undiscovered persistence. Further, Volt Typhoon's operational security is enhanced by targeted log deletion to conceal their actions within the compromised environment.

See the below sections for Volt Typhoon TTPs observed by the U.S. authoring agencies from multiple confirmed Volt Typhoon compromises.

Observed TTPs

Reconnaissance

Volt Typhoon actors conduct extensive pre-compromise reconnaissance [TA0043] to learn about the target organization [T1591], its network [T1590], and its staff [T1589]. This includes web searches [T1593]—including victim-owned sites [T1594]—for victim host [T1592], identity, and network information, especially for information on key network and IT administrators. According to industry reporting, Volt Typhoon actors use FOFA[1], Shodan, and Censys for querying or searching for exposed infrastructure. In some instances, the U.S. authoring agencies have observed Volt Typhoon actors targeting the personal emails of key network and IT staff [T1589.002] post compromise.

Resource Development

Historically, Volt Typhoon actors use multi-hop proxies for command and control (C2) infrastructure [T1090.003]. The proxy is typically composed of virtual private servers (VPSs) [T1583.003] or small office/home office (SOHO) routers. Recently, Volt Typhoon actors used Cisco and NETGEAR end-of-life SOHO routers implanted with KV Botnet malware to support their operations [T1584.005]. (See DOJ press release U.S. Government Disrupts Botnet People's Republic of China Used to Conceal Hacking of Critical Infrastructure for more information).

Initial Access

To obtain initial access [TA0001], Volt Typhoon actors commonly exploit vulnerabilities in networking appliances such as those from Fortinet, Ivanti Connect Secure (formerly Pulse Secure), NETGEAR, Citrix, and Cisco [T1190]. They often use publicly available exploit code for known vulnerabilities [T1588.005] but are also adept at discovering and exploiting zero-day vulnerabilities [T1587.004].

- In one confirmed compromise, Volt Typhoon actors likely obtained initial access by exploiting CVE-2022-42475 in a network perimeter FortiGate 300D firewall that was not patched. There is evidence of a buffer overflow attack identified within the Secure Sockets Layer (SSL)-VPN crash logs.

Once initial access is achieved, Volt Typhoon actors typically shift to establishing persistent access [TA0003]. They often use VPN sessions to securely connect to victim environments [T1133], enabling discreet follow-on intrusion activities. This tactic not only provides a stable foothold in the network but also allows them to blend in with regular traffic, significantly reducing their chances of detection.

Execution

Volt Typhoon actors rarely use malware for post-compromise execution. Instead, once Volt Typhoon actors gain access to target environments, they use hands-on-keyboard activity via the command-line [T1059] and other native tools and processes on systems [T1218] (often referred to as "LOLBins"), known as LOTL, to maintain and expand access to the victim networks. According to industry reporting, some "commands appear to be exploratory or experimental, as the operators [i.e., malicious actors] adjust and repeat them multiple times."[2]

For more details on LOTL activity, see the Credential Access and Discovery sections and Appendix A: Volt Typhoon LOTL Activity.

Similar to LOTL, Volt Typhoon actors also use legitimate but outdated versions of network admin tools. For example, in one confirmed compromise, actors downloaded [T1105] an outdated version of `comsvcs.dll` on the DC in a non-standard folder. `comsvcs.dll` is a legitimate Microsoft Dynamic Link Library (DLL) file normally found in the `System32` folder. The actors used this DLL with `MiniDump` and the process ID of the Local Security Authority Subsystem Service (LSASS) to dump the LSASS process memory [T1003.001] and obtain credentials (LSASS process memory space contains hashes for the current user's operating system (OS) credentials).

The actors also use legitimate non-native network admin and forensic tools. For example, Volt Typhoon actors have been observed using Magnet RAM Capture (MRC) version 1.20 on domain controllers. MRC is a free imaging tool that captures the physical memory of a computer, and Volt Typhoon actors likely used it to analyze in-memory data for sensitive information (such as credentials) and in-transit data not typically accessible on disk. Volt Typhoon actors have also been observed implanting Fast Reverse Proxy (FRP) for command and control.[3] (See the Command and Control section).

Persistence

Volt Typhoon primarily relies on valid credentials for persistence [T1078].

Defense Evasion

Volt Typhoon has strong operational security. Their actors primarily use LOTL for defense evasion [TA0005], which allows them to camouflage their malicious activity with typical system and network behavior, potentially circumventing simplistic endpoint security capabilities. For more information, see joint guide Identifying and Mitigating Living off the Land Techniques.

Volt Typhoon actors also obfuscate their malware. In one confirmed compromise, Volt Typhoon obfuscated FRP client files (`BrightmetricAgent.exe` and `SMSvcService.exe`) and the command-line port scanning utility ScanLine by packing the files with Ultimate Packer for Executables (UPX) [T1027.002]. FRP client applications support encryption, compression, and easy token authentication and work across multiple protocols—including transmission control protocol (TCP), user datagram protocol (UDP), hypertext transfer protocol (HTTP), and hypertext transfer protocol secure (HTTPS). The FRP client applications use the Kuai connection protocol (KCP) for error-checked and anonymous data stream delivery over UDP, with packet-level encryption support. See Appendix C and CISA Malware Analysis Report (MAR)-10448362-1.v1 for more information.

In addition to LOTL and obfuscation techniques, Volt Typhoon actors have been observed selectively clearing Windows Event Logs [T1070.001], system logs, and other technical artifacts to remove evidence [T1070.009] of their intrusion activity and masquerading file names [T1036.005].

Credential Access

Volt Typhoon actors first obtain credentials from public-facing appliances after gaining initial access by exploiting privilege escalation vulnerabilities [T1068] in the operating system or network services.

In some cases, they have obtained credentials insecurely stored on the appliance [T1552]. In one instance, where Volt Typhoon likely exploited CVE-2022-42475 in an unpatched Fortinet device, Volt Typhoon actors compromised a domain admin account stored inappropriately on the device.

Volt Typhoon also consistently obtains valid credentials by extracting the Active Directory database file (`NTDS.dit`)—in some cases multiple times from the same victim over long periods [T1003.003]. `NTDS.dit` contains usernames, hashed passwords, and group memberships for all domain accounts, essentially allowing for full domain compromise if the hashes can be cracked offline.

To obtain `NTDS.dit`, the U.S. authoring agencies have observed Volt Typhoon:

1. Move laterally [TA0008] to the domain controller via an interactive RDP session using a compromised account with domain administrator privileges [T1021.001];
2. Execute the Windows-native `vssadmin` [T1006] command to create a volume shadow copy;
3. Use Windows Management Instrumentation Console (WMIC) commands [T1047] to execute `ntdsutil` (a LOTL utility) to copy `NTDS.dit` and `SYSTEM` registry hive from the volume shadow copy; and
4. Exfiltrate [TA0010] `NTDS.dit` and `SYSTEM` registry hive to crack passwords offline) [T1110.002]. (For more details, including specific commands used, see Appendix A: Volt Typhoon LOTL Activity.)
   Note: A volume shadow copy contains a copy of all the files and folders that exist on the specified volume. Each volume shadow copy created on a DC includes its `NTDS.dit` and the `SYSTEM` registry hive, which provides keys to decrypt the `NTDS.dit` file.

Volt Typhoon actors have also been observed interacting with a PuTTY application by enumerating existing stored sessions [T1012]. Given this interaction and the exposure of cleartext-stored proxy passwords used in remote administration, Volt Typhoon actors potentially had access to PuTTY profiles that allow access to critical systems (see the Lateral Movement section).

According to industry reporting, Volt Typhoon actors attempted to dump credentials through LSASS (see Appendix B for commands used).[2]

The U.S. authoring agencies have observed Volt Typhoon actors leveraging Mimikatz to harvest credentials, and industry partners have observed Volt Typhoon leveraging Impacket.[2]

- Mimikatz is a credential dumping tool and Volt Typhoon actors use it to obtain credentials. In one confirmed compromise, the Volt Typhoon used RDP to connect to a server and run Mimikatz after leveraging a compromised administrator account to deploy it.
- Impacket is an open source Python toolkit for programmatically constructing and manipulating network protocols. It contains tools for Kerberos manipulation, Windows credential dumping, packet sniffing, and relay attacks—as well as remote service execution.

Discovery

Volt Typhoon actors have been observed using commercial tools, LOTL utilities, and appliances already present on the system for system information [T1082], network service [T1046], group [T1069] and user [T1033] discovery.

Volt Typhoon uses at least the following LOTL tools and commands for system information, network service, group, and user discovery techniques:

- cmd
- certutil
- dnscmd
- ldifde
- makecab
- net user/group/use
- netsh
- nltest
- netstat
- ntdsutil
- ping
- PowerShell
- quser
- reg query/reg save
- systeminfo
- tasklist
- wevtutil
- whoami
- wmic
- xcopy

Some observed specific examples of discovery include:

- Capturing successful logon events [T1654].
  - Specifically, in one incident, analysis of the PowerShell console history of a domain controller indicated that security event logs were directed to a file named `user.dat`, as evidenced by the executed command `Get-EventLog security -instanceid 4624 -after [year-month-date] | fl * | Out-File 'C:\users\public\documents\user.dat'`. This indicates the group's specific interest in capturing successful logon events (event ID `4624`) to analyze user authentication patterns within the network. Additionally, file system analysis, specifically of the Master File Table (MFT), uncovered evidence of a separate file, `systeminfo.dat`, which was created in `C:\Users\Public\Documents` but subsequently deleted [T1070.004]. The presence of these activities suggests a methodical approach by Volt Typhoon actors in collecting and then possibly removing traces of sensitive log information from the compromised system.
- Executing `tasklist /v` to gather a detailed process listing [T1057], followed by executing `taskkill /f /im rdpservice.exe` (the function of this executable is not known).
- Executing `net user` and `quser` for user account information [T1087.001].
- Creating and accessing a file named `rult3uil.log` on a domain controller in `C:\Windows\System32\`. The `rult3uil.log` file contained user activities on a compromised system, showcasing a combination of window title information [T1010] and focus shifts, keypresses, and command executions across Google Chrome and Windows PowerShell, with corresponding timestamps.
- Employing `ping` with various IP addresses to check network connectivity [T1016.001] and `net start` to list running services [T1007].

See Appendix A for additional LOTL examples.

In one confirmed compromise, Volt Typhoon actors attempted to use Advanced IP Scanner, which was on the network for admin use, to scan the network.

Volt Typhoon actors have been observed strategically targeting network administrator web browser data—focusing on both browsing history and stored credentials [T1555.003]—to facilitate targeting of personal email addresses (see the Reconnaissance section) for further discovery and possible network modifications that may impact the threat actor's persistence within victim networks.

In one confirmed compromise:

- Volt Typhoon actors obtained the history file from the `User Data` directory of a network administrator user's Chrome browser. To obtain the history file, Volt Typhoon actors first executed an RDP session to the user's workstation where they initially attempted, and failed, to obtain the `C$ File Name: users\{redacted}\appdata\local\Google\Chrome\UserData\default\History` file, as evidenced by the accompanying `1016` (reopen failed) SMB error listed in the application event log. The threat actors then disconnected the RDP session to the workstation and accessed the file `C:\Users\{redacted}\Downloads\History.zip`. This file presumably contained data from the `User Data` directory of the user's Chrome browser, which the actors likely saved in the Downloads directory for exfiltration [T1074]. Shortly after accessing the `history.zip` file, the actors terminated RDP sessions.
- About four months later, Volt Typhoon actors accessed the same user's Chrome data `C$ File Name: Users\{redacted}\AppData\Local\Google\Chrome\User Data\Local State` and `$ File Name: Users\{redacted}\AppData\Local\Google\Chrome\User Data\Default\Login Data` via SMB. The Local State file contains the Advanced Encryption Standard (AES) encryption key [T1552.004] used to encrypt the passwords stored in the Chrome browser, which would enable the actors to obtain plaintext passwords stored in the Login Data file in the Chrome browser.

In another confirmed compromise, Volt Typhoon actors accessed directories containing Chrome and Edge user data on multiple systems. Directory interaction was observed over the network to paths such as `C:\Users\{redacted}\AppData\Local\Google\Chrome\User Data\` and `C:\Users\{redacted}\AppData\Local\Microsoft\Edge\User Data\`. They also enumerated several directories, including directories containing vulnerability testing and cyber related content and facilities data, such as construction drawings [T1083].

Lateral Movement

For lateral movement, Volt Typhoon actors have been observed predominantly employing RDP with compromised valid administrator credentials. **Note:** With a full on-premises Microsoft Active Directory identity compromise (see the Credential Access section), the group may be capable of using other methods such as Pass the Hash or Pass the Ticket for lateral movement [T1550].

In one confirmed compromise of a Water and Wastewater Systems Sector entity, after obtaining initial access, Volt Typhoon actors connected to the network via a VPN with administrator credentials they obtained and opened an RDP session with the same credentials to move laterally. Over a nine-month period, they moved laterally to a file server, a domain controller, an Oracle Management Server (OMS), and a VMware vCenter server. The actors obtained domain credentials from the domain controller and performed discovery, collection, and exfiltration on the file server (see the Discovery and Collection and Exfiltration sections).

Volt Typhoon's movement to the vCenter server was likely strategic for pre-positioning to OT assets. The vCenter server was adjacent to OT assets, and Volt Typhoon actors were observed interacting

with the PuTTY application on the server by enumerating existing stored sessions. With this information, Volt Typhoon potentially had access to a range of critical PuTTY profiles, including those for water treatment plants, water wells, an electrical substation, OT systems, and network security devices. This would enable them to access these critical systems [T1563]. See Figure 2.

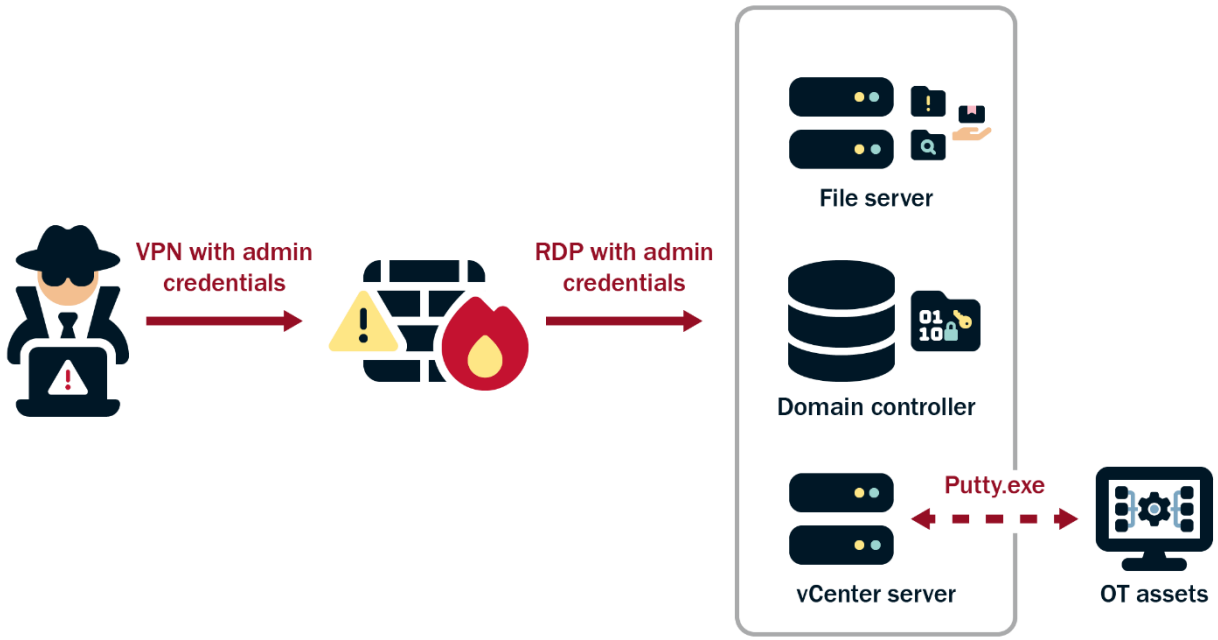

Figure 2: Volt Typhoon Lateral Movement Path File Server, DC, and OT-Adjacent Assets

Additionally, Volt Typhoon actors have been observed using PSExec to execute remote processes, including the automated acceptance of the end-user license agreement (EULA) through an administrative account, signified by the `accepteula` command flag.

Volt Typhoon actors may have attempted to move laterally to a cloud environment in one victim's network but direct attribution to the Volt Typhoon group was inconclusive. During the period of the their known network presence, there were anomalous login attempts to an Azure tenant [T1021.007] potentially using credentials [T1078.004] previously compromised from theft of `NTDS.dit`. These attempts, coupled with misconfigured virtual machines with open RDP ports, suggested a potential for cloud-based lateral movement. However, subsequent investigations, including password changes and multifactor authentication (MFA) implementations, revealed authentication failures from non-associated IP addresses, with no definitive link to Volt Typhoon.

Collection and Exfiltration

The U.S. authoring agencies assess Volt Typhoon primarily collects information that would facilitate follow-on actions with physical impacts. For example, in one confirmed compromise, they collected [TA0009] sensitive information obtained from a file server in multiple zipped files [T1560] and likely exfiltrated [TA0010] the files via Server Message Block (SMB) [T1048] (see Figure 3). Collected

information included diagrams and documentation related to OT equipment, including supervisory control and data acquisition (SCADA) systems, relays, and switchgear. This data is crucial for understanding and potentially impacting critical infrastructure systems, indicating a focus on gathering intelligence that could be leveraged in actions targeting physical assets and systems.

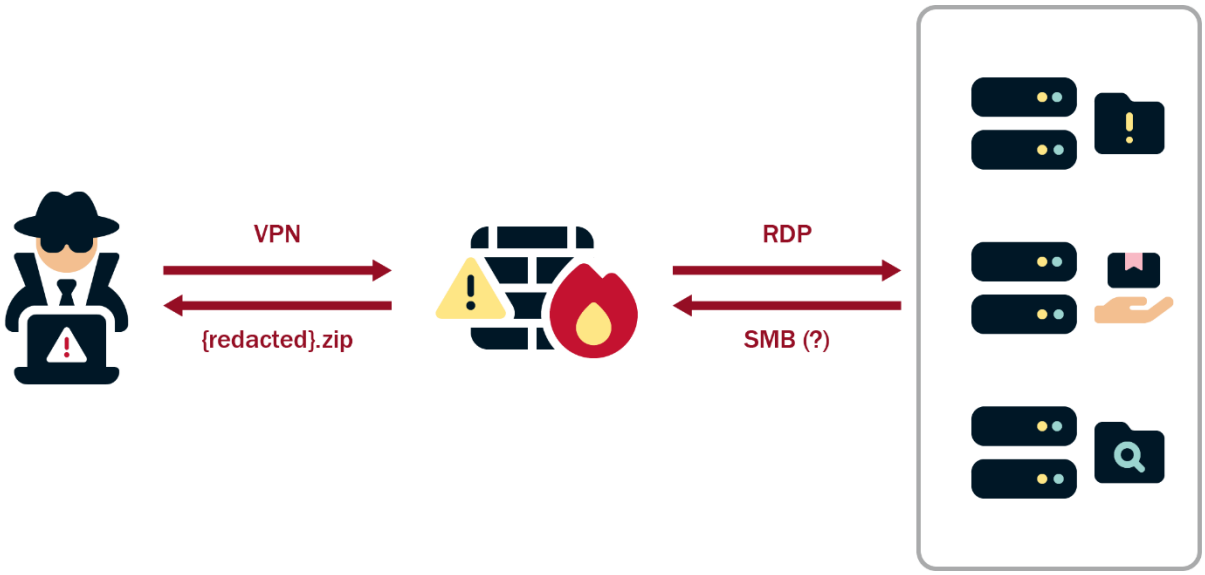

Figure 3: Volt Typhoon Attack Path for Exfiltration of Data from File Server

In another compromise, Volt Typhoon actors leveraged WMIC to create and use temporary directories (`C:\Users\Public\pro`, `C:\Windows\Temp\tmp`, `C:\Windows\Temp\tmp\Active Directory` and `C:\Windows\Temp\tmp\registry`) to stage the extracted `ntds.dit` and `SYSTEM` registry hives from `ntdsutil` execution volume shadow copies (see the Credential Access section) obtained from two DCs. They then compressed and archived the extracted `ntds.dit` and accompanying registry files by executing `ronf.exe`, which was likely a renamed version of the archive utility `rar.exe`) [T1560.001].

Command and Control

Volt Typhoon actors have been observed leveraging compromised SOHO routers and virtual private servers (VPS) to proxy C2 traffic. For more information, see DOJ press release U.S. Government Disrupts Botnet People's Republic of China Used to Conceal Hacking of Critical Infrastructure).

They have also been observed setting up FRP clients [T1090] on a victim's corporate infrastructure to establish covert communications channels [T1573] for command and control. In one instance, Volt Typhoon actors implanted the FRP client with filename `SMSvcService.exe` on a Shortel Enterprise Contact Center (ECC) server and a second FRP client with filename `Brightmetricagent.exe` on another server. These clients, when executed via PowerShell [T1059.001], open reverse proxies

between the compromised system and Volt Typhoon C2 servers. `Brightmetricagent.exe` has additional capabilities. The FRP client can locate servers behind a network firewall or obscured through Network Address Translation (NAT) [T1016]. It also contains multiplexer libraries that can bi-directionally stream data over NAT networks and contains a command-line interface (CLI) library that can leverage command shells such as PowerShell, Windows Management Instrumentation (WMI), and Z Shell (zsh) [T1059.004]. See Appendix C and MAR-10448362-1.v1 for more information.

In the same compromise, Volt Typhoon actors exploited a Paessler Router Traffic Grapher (PRTG) server as an intermediary for their FRP operations. To facilitate this, they used the `netsh` command, a legitimate Windows command, to create a PortProxy registry modification [T1112] on the PRTG server [T1090.001]. This key alteration redirected specific port traffic to Volt Typhoon's proxy infrastructure, effectively converting the PRTG's server into a proxy for their C2 traffic [T1584.004] (see Appendix B for details).

DETECTION/HUNT RECOMMENDATIONS

Apply Living off the Land Detection Best Practices

Apply the prioritized detection and hardening best practice recommendations provided in joint guide Identifying and Mitigating Living off the Land Techniques. Many organizations lack security and network management best practices (such as established baselines) that support detection of malicious LOTL activity—this makes it difficult for network defenders to discern legitimate behavior from malicious behavior and conduct behavior analytics, anomaly detection, and proactive hunting. Conventional IOCs associated with the malicious activity are generally lacking, complicating network defenders' efforts to identify, track, and categorize this sort of malicious behavior. This advisory provides guidance for a multifaceted cybersecurity strategy that enables behavior analytics, anomaly detection, and proactive hunting, which are part of a comprehensive approach to mitigating cyber threats that employ LOTL techniques.

Review Application, Security, and System Event Logs

Routinely review application, security, and system event logs, focusing on Windows Extensible Storage Engine Technology (ESENT) Application Logs. Due to Volt Typhoon's ability for long-term undetected persistence, network defenders should assume significant dwell time and review specific application event log IDs, which remain on endpoints for longer periods compared to security event logs and other ephemeral artifacts. Focus on Windows ESENT logs because certain ESENT Application Log event IDs (`216`, `325`, `326`, and `327`) may indicate actors copying `NTDS.dit`.

See Table 1 for examples of ESENT and other key log indicators that should be investigated. Please note that incidents may not always have exact matches listed in the Event Detail column due to variations in event logging and TTPs.

Table 1: Key Log Indicators for Detecting Volt Typhoon Activity

Event ID (Log)	Event Detail	Description
216 (Windows ESENT Application Log)	A database location change was detected from 'C:\Windows\NTDS\ntds.dit' to '\\?\GLOBALROOT\Device\{redacted}VolumeShadowCopy1\Windows\NTDS\ntds.dit'	A change in the `NTDS.dit` database location is detected. This could suggest an initial step in NTDS credential dumping where the database is being prepared for extraction.
325 (Windows ESENT Application Log)	The database engine created a new database (2, C:\Windows\Temp\tmp\Active Directory\ntds.dit).	Indicates creation of a new `NTDS.dit` file in a non-standard directory. Often a sign of data staging for exfiltration. Monitor for unusual database operations in temp directories.
637 (Windows ESENT Application Log)	C:\Windows\Temp\tmp\Active Directory\ntds.jfm-++- (0) New flush map file “C:\Windows\Temp\tmp\Active Directory\ntds.jfm” will be created to enable persisted lost flush detection.	A new flush map file is being created for `NTDS.dit`. This may suggest ongoing operations related to NTDS credential dumping, potentially capturing uncommitted changes to the `NTDS.dit` file.
326 (Windows ESENT Application Log)	NTDS-++-12460,D,100-++--++-1-++- C:\$SNAP_{redacted}_VOLUMEC$\Windows\NTDS\ntds.dit-++-0-++- [1] The database engine attached a database. Began mounting of C:\Windows\NTDS\ntds.dit file created from volume shadow copy process	Represents the mounting of an `NTDS.dit` file from a volume shadow copy. This is a critical step in NTDS credential dumping, indicating active manipulation of a domain controller’s data.

Event ID (Log)	Event Detail	Description
327 (Windows ESENT Application Log)	C:\Windows\Temp\tmp\Active Directory\ntds.dit-++-1-++- [1] The database engine detached a database (2, C:\Windows\Temp\tmp\Active Directory\ntds.dit). Completion of mounting of ntds.dit file to C:\Windows\Temp\tmp\Active Director	The detachment of a database, particularly in a temp directory, could indicate the completion of a credential dumping process, potentially as part of exfiltration preparations.
21 (Windows Terminal Services Local Session Manager Operational Log)	Remote Desktop Services: Session logon succeeded: User: {redacted}\{redacted} Session ID: {redacted} Source Network Address: {redacted}	Successful authentication to a Remote Desktop Services session.
22 (Windows Terminal Services Local Session Manager Operational Log)	Remote Desktop Services: Shell start notification received: User: {redacted}\{redacted} Session ID: {redacted} Source Network Address: {redacted}	Successful start of a new Remote Desktop session. This may imply lateral movement or unauthorized remote access, especially if the user or session is unexpected.
23 (Windows Terminal Services Local Session Manager Operational Log)	Remote Desktop Services: Session logoff succeeded: User: {redacted}\{redacted} Session ID: {redacted}	Successful logoff of Remote Desktop session.
24 (Windows Terminal Services Local	Remote Desktop Services: Session has been disconnected: User: {redacted}\{redacted} Session ID: {redacted} Source Network Address: {redacted}	Remote Desktop session disconnected by user or due to network connectivity issues.

Event ID (Log)	Event Detail	Description
Session Manager Operational Log)		
25 (Windows Terminal Services Local Session Manager Operational Log)	Remote Desktop Services: Session reconnection succeeded: User: {redacted}\{redacted} Session ID: {redacted} Source Network Address: {redacted}	Successful reconnection to a Remote Desktop Services session. This may imply lateral movement or unauthorized remote access, especially if the user or session is unexpected.
1017 (Windows System Log)	Handle scavenged. Share Name: C$ File Name: users\{redacted}\downloads\History.zip Durable: 1 Resilient or Persistent: 0 Guidance: The server closed a handle that was previously reserved for a client after 60 seconds.	Indicates the server closed a handle for a client. While common in network operations, unusual patterns or locations (like `History.zip` in a user's downloads) may suggest data collection from a local system.
1102 (Windows Security Log)	All	All Event ID `1102` entries should be investigated as logs are generally not cleared and this is a known Volt Typhoon tactic to cover their tracks.

Monitor and Review OT System Logs

- Review access logs for communication paths between IT and OT networks, looking for anomalous accesses or protocols.
- Measure the baseline of normal operations and network traffic for the industrial control system (ICS) and assess traffic anomalies for malicious activity.
- Configure intrusion detection systems (IDS) to create alarms for any ICS network traffic outside normal operations.
- Track and monitor audit trails on critical areas of ICS.

- Set up security incident and event monitoring (SIEM) to monitor, analyze, and correlate event logs from across the ICS network to identify intrusion attempts.

Review CISA's Recommended Cybersecurity Practices for Industrial Control Systems and the joint advisory, NSA and CISA Recommend Immediate Actions to Reduce Exposure Across all Operational Technologies and Control Systems, for further OT system detection and mitigation guidance.

Use gait to Detect Possible Network Proxy Activities

Use gait[4] to detect network proxy activities. Developed by Sandia National Labs, gait is a publicly available Zeek[5] extension. The gait extension can help enrich Zeek's network connection monitoring and SSL logs by including additional metadata in the logs. Specifically, gait captures unique TCP options and timing data such as a TCP, transport layer security (TLS), and Secure Shell (SSH) layer inferred round trip times (RTT), aiding in the identification of the software used by both endpoints and intermediaries.

While the gait extension for Zeek is an effective tool for enriching network monitoring logs with detailed metadata, it is not specifically designed to detect Volt Typhoon actor activities. The extension's capabilities extend to general anomaly detection in network traffic, including—but not limited to—proxying activities. Therefore, while gait can be helpful in identifying tactics similar to those used by Volt Typhoon, such as proxy networks and FRP clients for C2 communication, not all proxying activities detected by using this additional metadata are necessarily indicative of Volt Typhoon presence. It serves as a valuable augmentation to current security stacks for a broader spectrum of threat detection.

For more information, see Sandia National Lab's gait GitHub page sandialabs/gait: Zeek Extension to Collect Metadata for Profiling of Endpoints and Proxies.

Review Logins for Impossible Travel

Examine VPN or other account logon times, frequency, duration, and locations. Logons from two geographically distant locations within a short timeframe from a single user may indicate an account is being used maliciously. Logons of unusual frequency or duration may indicate a threat actor attempting to access a system repeatedly or maintain prolonged sessions for the purpose of data extraction.

Review Standard Directories for Unusual Files

Review directories, such as `C:\windows\temp\` and `C:\users\public\`, for unexpected or unusual files. Monitor these temporary file storage directories for files typically located in standard system paths, such as the `System32` directory. For example, Volt Typhoon has been observed downloading `comsvcs.dll` to a non-standard folder (this file is normally found in the `System32` folder).

INCIDENT RESPONSE

If compromise, or potential compromise, is detected, **organizations should assume full domain compromise** because of Volt Typhoon's known behavioral pattern of extracting the `NTDS.dit` from

the DCs. Organizations should immediately implement the following immediate, defensive countermeasures:

1. **Sever the enterprise network from the internet. Note:** this step requires the agency to understand its internal and external connections. When making the decision to sever internet access, knowledge of connections must be combined with care to avoid disrupting critical functions.
   a. If you cannot sever from the internet, **shutdown all non-essential traffic between the affected enterprise network and the internet**.
2. **Reset credentials of privileged and non-privileged accounts within the trust boundary of each compromised account**.
   a. Reset passwords for all domain users and all local accounts, such as `Guest`, `HelpAssistant`, `DefaultAccount`, `System`, `Administrator`, and `kbrtgt`. The `kbrtgt` account is responsible for handling Kerberos ticket requests as well as encrypting and signing them. The `kbrtgt` account should be reset twice because the account has a two-password history. The first account reset for the `kbrtgt` needs to be allowed to replicate prior to the second reset to avoid any issues. See CISA's Eviction Guidance for Networks Affected by the SolarWinds and Active Directory/M365 Compromise for more information. Although tailored to FCEB agencies compromised in the 2020 SolarWinds Orion supply chain compromise, the steps are applicable to organizations with Windows AD compromise.
      i) Review access policies to temporarily revoke privileges/access for affected accounts/devices. If it is necessary to not alert the attacker (e.g., for intelligence purposes), then privileges can be reduced for affected accounts/devices to "contain" them.
   b. Reset the relevant account credentials or access keys if the investigation finds the threat actor's access is limited to non-elevated permissions.
      i) Monitor related accounts, especially administrative accounts, for any further signs of unauthorized access.
3. Audit all network appliance and edge device configurations with indicators of malicious activity for signs of unauthorized or malicious configuration changes. Organizations should ensure they audit the current network device running configuration and any local configurations that could be loaded at boot time. If configuration changes are identified:
   a. Change all credentials being used to manage network devices, to include keys and strings used to secure network device functions (SNMP strings/user credentials, IPsec/IKE preshared keys, routing secrets, TACACS/RADIUS secrets, RSA keys/certificates, etc.).
   b. Update all firmware and software to the latest version.
4. **Report the compromise to an authoring agency** (see the Contact Information section).
5. For organizations with cloud or hybrid environments, **apply best practices for identity and credential access management.**
   a. Verify that all accounts with privileged role assignments are cloud native, not synced from Active Directory.

b. Audit conditional access policies to ensure Global Administrators and other highly privileged service principals and accounts are not exempted.
c. Audit privileged role assignments to ensure adherence to the principle of least privilege when assigning privileged roles.
d. Leverage just-in-time and just-enough access mechanisms when administrators need to elevate to a privileged role.
e. In hybrid environments, ensure federated systems (such as AD FS) are configured and monitored properly.
f. Audit Enterprise Applications for recently added applications and examine the API permissions assigned to each.

6. **Reconnect to the internet. Note:** The decision to reconnect to the internet depends on senior leadership's confidence in the actions taken. It is possible—depending on the environment—that new information discovered during pre-eviction and eviction steps could add additional eviction tasks.
7. **Minimize and control use of remote access tools and protocols** by applying best practices from joint Guide to Securing Remote Access Software and joint Cybersecurity Information Sheet: Keeping PowerShell: Security Measures to Use and Embrace.
8. **Consider sharing technical information with an authoring agency and/or a sector-specific information sharing and analysis center.**

For more information on incident response and remediation, see:

- Joint advisory Technical Approaches to Uncovering and Remediating Malicious Activity. This advisory provides incident response best practices.
- CISA's Federal Government Cybersecurity Incident and Vulnerability Response Playbooks. Although tailored to U.S. Federal Civilian Executive Branch (FCEB) agencies, the playbooks are applicable to all organizations. The incident response playbook provides procedures to identify, coordinate, remediate, recover, and track successful mitigations from incidents.
- Joint Water and Wastewater Sector - Incident Response Guide. This joint guide provides incident response best practices and information on federal resources for Water and Wastewater Systems Sector organizations.

MITIGATIONS

The authoring agencies recommend organizations implement the mitigations below to improve your organization's cybersecurity posture on the basis of Volt Typhoon activity. These mitigations align with the Cross-Sector Cybersecurity Performance Goals (CPGs) developed by CISA and the National Institute of Standards and Technology (NIST). The CPGs provide a minimum set of practices and protections that CISA and NIST recommend all organizations implement. CISA and NIST based the CPGs on existing cybersecurity frameworks and guidance to protect against the most common and impactful threats, tactics, techniques, and procedures. Visit CISA's Cross-Sector Cybersecurity Performance Goals for more information on the CPGs, including additional recommended baseline protections.

These mitigations are intended for IT administrators in critical infrastructure organizations. The authoring agencies recommend that software manufactures incorporate secure by design and default principles and tactics into their software development practices to strengthen the security posture for their customers.

For information on secure by design practices that may protect customers against common Volt Typhoon techniques, see joint guide Identifying and Mitigating Living off the Land Techniques and joint Secure by Design Alert Security Design Improvements for SOHO Device Manufacturers.

For more information on secure by design, see CISA's Secure by Design webpage and joint guide.

IT Network Administrators and Defenders

Harden the Attack Surface

- **Apply patches for internet-facing systems within a risk-informed span of time** [CPG 1E]. Prioritize patching critical assets, known exploited vulnerabilities, and vulnerabilities in appliances known to be frequently exploited by Volt Typhoon (e.g., Fortinet, Ivanti, NETGEAR, Citrix, and Cisco devices).
- **Apply vendor-provided or industry standard hardening guidance** to strengthen software and system configurations. **Note:** As part of CISA's Secure by Design campaign, CISA urges software manufacturers to prioritize secure by default configurations to eliminate the need for customer implementation of hardening guidelines.
- **Maintain and regularly update an inventory of all organizational IT assets** [CPG 1A].
- **Use third party assessments to validate current system and network security compliance** via security architecture reviews, penetration tests, bug bounties, attack surface management services, incident simulations, or table-top exercises (both announced and unannounced) [CPG 1F].
- **Limit internet exposure of systems when not necessary**. An organization's primary attack surface is the combination of the exposure of all its internet-facing systems. Decrease the attack surface by not exposing systems or management interfaces to the internet when not necessary.

Secure Credentials

- **Do not store credentials on edge appliances/devices.** Ensure edge devices do not contain accounts that could provide domain admin access.
- **Do not store plaintext credentials on any system** [CPG 2L]. Credentials should be stored securely—such as with a credential/password manager or vault, or other privileged account management solutions—so they can only be accessed by authenticated and authorized users.
- **Change default passwords** [CPG 2A] and ensure they meet the policy requirements for complexity.
- Implement and enforce an organizational system-enforced policy that:
  - **Requires passwords for all IT password-protected assets to be at least 15 characters;**
  - **Does not allow users to reuse passwords for accounts, applications, services**, etc., [CPG 2C]; and
  - **Does not allow service accounts/machine accounts to reuse passwords** from member user accounts.
- **Configure Group Policy settings to prevent web browsers from saving passwords** and disable autofill functions.
- **Disable the storage of clear text passwords in LSASS memory**.

Secure Accounts

- **Implement phishing-resistant MFA** for access to assets [CPG 2H].
- **Separate user and privileged accounts**.
  - User accounts should never have administrator or super-user privileges [CPG 2E].
  - Administrators should never use administrator accounts for actions and activities not associated with the administrator role (e.g., checking email, web browsing).
- **Enforce the principle of least privilege**.
  - **Ensure administrator accounts only have the minimum permissions** necessary to complete their tasks.
  - **Review account permissions for default/accounts for edge appliances/devices and remove domain administrator privileges,** if identified.
  - **Significantly limit the number of users with elevated privileges**. Implement continuous monitoring for changes in group membership, especially in privileged groups, to detect and respond to unauthorized modifications.
  - **Remove accounts from high-privilege groups like Enterprise Admins and Schema Admins**. Temporarily reinstate these privileges only when necessary and under strict auditing to reduce the risk of privilege abuse.
  - **Transition to Group Managed Service Accounts (gMSAs)** where suitable for enhanced management and security of service account credentials. gMSAs provide automated password management and simplified Service Principal Name (SPN) management, enhancing security over traditional service accounts. See Microsoft's Group Managed Service Accounts Overview.

- **Enforce strict policies via Group Policy and User Rights Assignments** to limit high-privilege service accounts.
- **Consider using a privileged access management (PAM) solution** to manage access to privileged accounts and resources [CPG 2L]. PAM solutions can also log and alert usage to detect any unusual activity.
- **Complement the PAM solution with role-based access control (RBAC)** for tailored access based on job requirements. This ensures that elevated access is granted only when required and for a limited duration, minimizing the window of opportunity for abuse or exploitation of privileged credentials.
- **Implement an Active Directory tiering model to segregate administrative accounts** based on their access level and associated risk. This approach reduces the potential impact of a compromised account. See Microsoft's PAM environment tier model.
- **Harden administrative workstations** to only permit administrative activities from workstations appropriately hardened based on the administrative tier. See Microsoft's Why are privileged access devices important - Privileged access.
- **Disable all user accounts and access to organizational resources of employees on the day of their departure** [CPG 2G]
- **Regularly audit all user, admin, and service accounts** and remove or disable unused or unneeded accounts as applicable.
- **Regularly roll NTLM hashes of accounts that support token-based authentication.**
- Improve management of hybrid (cloud and on-premises) identity federation by:
  - **Using cloud only administrators that are asynchronous with on-premises environments** and ensuring on-premises administrators are asynchronous to the cloud.
  - **Using CISA's SCuBAGear tool to discover cloud misconfigurations in Microsoft cloud tenants**. SCuBA gear is automation script for comparing Federal Civilian Executive Branch (FCEB) agency tenant configurations against CISA M365 baseline recommendations. SCuBAGear is part of CISA's Secure Cloud Business Applications (SCuBA) project, which provides guidance for FCEB agencies, securing their cloud business application environments and protecting federal information created, accessed, shared, and stored in those environments. Although tailored to FCEB agencies, the project provides security guidance applicable to all organizations with cloud environments. For more information on SCuBAGear see CISA's Secure Cloud Business Applications (SCuBA) Project.
  - **Using endpoint detection and response capabilities to actively** defend on-premises federation servers.

Secure Remote Access Services

- **Limit the use of RDP and other remote desktop services**. If RDP is necessary, apply best practices, including auditing the network for systems using RDP, closing unused RDP ports, and logging RDP login attempts.

- **Disable Server Message Block (SMB) protocol version 1 and upgrade to version 3 (SMBv3)** after mitigating existing dependencies (on existing systems or applications), as they may break when disabled.
- **Harden SMBv3** by implementing guidance included in joint #StopRansomware Guide (see page 8 of the guide).
- **Apply mitigations from the joint Guide to Securing Remote Access Software**.

Secure Sensitive Data

- **Securely store sensitive data** (including operational technology documentation, network diagrams, etc.), ensuring that only authenticated and authorized users can access the data.

Implement Network Segmentation

- **Ensure that sensitive accounts use their administrator credentials only on hardened, secure computers**. This practice can reduce lateral movement exposure within networks.
- **Conduct comprehensive trust assessments to identify business-critical trusts and apply necessary controls** to prevent unauthorized cross-forest/domain traversal.
- **Harden federated authentication by enabling Secure Identifier (SID) Filtering and Selective Authentication on AD trust relationships** to further restrict unauthorized access across domain boundaries.
- **Implement network segmentation to isolate federation servers** from other systems and limit allowed traffic to systems and protocols that require access in accordance with Zero Trust principles.

Secure Cloud Assets

- **Harden cloud assets** in accordance with vendor-provided or industry standard hardening guidance.
  - Organizations with Microsoft cloud infrastructure, see CISA's Microsoft 365 Security Configuration Baseline Guides, which provide minimum viable secure configuration baselines for Microsoft Defender for Office 365, Azure Active Directory (now known as Microsoft Entra ID), Exchange Online, OneDrive for Business, Power BI, Power Platform, SharePoint Online, and Teams. For additional guidance, see the Australian Signals Directorate's Blueprint for Secure Cloud.
  - Organizations with Google cloud infrastructure, see CISA's Google Workspace Security Configuration Baseline Guides, which provide minimum viable secure configuration baselines for Groups for Business, GMAIL, Google Calendar, Google Chat, Google Common Controls, Google Classroom, Google Drive and Docs, Google Meet, and Google Sites.
- **Revoke unnecessary public access to cloud environment.** This involves reviewing and restricting public endpoints and ensuring that services like storage accounts, databases, and virtual machines are not publicly accessible unless absolutely necessary. Disable legacy authentication protocols across all cloud services and platforms. Legacy protocols frequently lack support for advanced security mechanisms such as multifactor authentication, rendering

them susceptible to compromises. Instead, enforce the use of modern authentication protocols that support stronger security features like MFA, token-based authentication, and adaptive authentication measures.
    - **Enforce this practice through the use of Conditional Access Policies**. These policies can initially be run in `report-only` mode to identify potential impacts and plan mitigations before fully enforcing them. This approach allows organizations to systematically control access to their cloud resources, significantly reducing the risk of unauthorized access and potential compromise.
- **Regularly monitor and audit privileged cloud-based accounts**, including service accounts, which are frequently abused to enable broad cloud resource access and persistence.

Be Prepared

- **Ensure logging is turned on for application, access, and security logs** (e.g., intrusion detection systems/intrusion prevention systems, firewall, data loss prevention, and VPNs) [CPG 2T]. Given Volt Typhoon's use of LOTL techniques and their significant dwell time, application event logs may be a valuable resource to hunt for Volt Typhoon activity because these logs typically remain on endpoints for relatively long periods of time.
    - For OT assets where logs are non-standard or not available, **collect network traffic and communications between those assets and other assets**.
    - Implement file integrity monitoring (FIM) tools to detect unauthorized changes.
- **Store logs in a central system**, such as a security information and event management (SIEM) tool or central database.
    - **Ensure the logs can only be accessed or modified by authorized and authenticated users** [CPG 2U].
    - **Store logs for a period informed by risk or pertinent regulatory guidelines**.
    - **Tune log alerting to reduce noise while ensuring there are alerts for high-risk activities**. (For information on alert tuning, see joint guide Identifying and Mitigating Living Off the Land Techniques.)
- **Establish and continuously maintain a baseline of installed tools and software, account behavior, and network traffic**. This way, network defenders can identify potential outliers, which may indicate malicious activity. **Note:** For information on establishing a baseline, see joint guide Identifying and Mitigating Living off the Land Techniques.
- **Document a list of threats and cyber actor TTPs relevant to your organization** (e.g., based on industry or sectors), and maintain the ability (such as via rules, alerting, or commercial prevention and detection systems) to detect instances of those key threats [CPG 3A].
- **Implement periodic training for all employees and contractors that covers basic security concepts** (such as phishing, business email compromise, basic operational security, password security, etc.), as well as fostering an internal culture of security and cyber awareness [CPG 2I].
    - **Tailor the training to network IT personnel/administrators and other key staff based on relevant organizational cyber threats and TTPs**, such as Volt Typhoon. For example, communicate that Volt Typhoon actors are known to target personal email

accounts of IT staff, and encourage staff to protect their personal email accounts by using strong passwords and implementing MFA.
    - In addition to basic cybersecurity training, **ensure personnel who maintain or secure OT as part of their regular duties receive OT-specific cybersecurity training** on at least an annual basis [CPG 2J].
    - **Educate users about the risks associated with storing unprotected passwords**.

OT Administrators and Defenders

- **Change default passwords** [CPG 2A] and ensure they meet the policy requirements for complexity. If the asset's password cannot be changed, implement compensating controls for the device; for example, segment the device into separate enclaves and implement increased monitoring and logging.
- **Require that passwords for all OT password-protected assets be at least 15 characters**, when technically feasible. In instances where minimum passwords lengths are not technically feasible (for example, assets in remote locations), apply compensating controls, record the controls, and log all login attempts. [CPG 2B].
- **Enforce strict access policies for accessing OT networks**. Develop strict operating procedures for OT operators that details secure configuration and usage.
- **Segment OT assets from IT environments** by [CPG 2F]:
    - **Denying all connections to the OT network by default** unless explicitly allowed (e.g., by IP address and port) for specific system functionality.
    - **Requiring necessary communications paths between IT and OT networks to pass through an intermediary**, such as a properly configured firewall, bastion host, "jump box," or a demilitarized zone (DMZ), which is closely monitored, captures network logs, and only allows connections from approved assets.
- **Closely monitor all connections into OT networks for misuse, anomalous activity, or OT protocols**.
- **Monitor for unauthorized controller change attempts**. Implement integrity checks of controller process logic against a known good baseline. Ensure process controllers are prevented from remaining in remote program mode while in operation if possible.
- **Lock or limit set points in control processes to reduce the consequences of unauthorized controller access**.
- **Be prepared** by:
    - **Determining your critical operational processes' reliance on key IT infrastructure**:
        - Maintain and regularly update an inventory of all organizational OT assets.
        - Understand and evaluate cyber risk on "as-operated" OT assets.
        - Create an accurate "as-operated" OT network map and identify OT and IT network inter-dependencies.
    - **Identifying a resilience plan that addresses how to operate if you lose access to or control of the IT and/or OT environment**.
        - Plan for how to continue operations if a control system is malfunctioning, inoperative, or actively acting contrary to the safe and reliable operation of the process.

        - Develop workarounds or manual controls to ensure ICS networks can be isolated if the connection to a compromised IT environment creates risk to the safe and reliable operation of OT processes.
    - **Create and regularly exercise an incident response plan**.
        - Regularly test manual controls so that critical functions can be kept running if OT networks need to be taken offline.
    - **Implement regular data backup procedures** on OT networks.
        - Regularly test backup procedures.
- **Follow risk-informed guidance** in the joint advisory NSA and CISA Recommend Immediate Actions to Reduce Exposure Across all Operational Technologies and Control Systems, the NSA advisory Stop Malicious Cyber Activity Against Connected Operational Technology.

CONTACT INFORMATION

US organizations: To report suspicious or criminal activity related to information found in this joint Cybersecurity Advisory, contact:

- CISA's 24/7 Operations Center at Report@cisa.gov or (888) 282-0870 or your local FBI field office. When available, please include the following information regarding the incident: date, time, and location of the incident; type of activity; number of people affected; type of equipment used for the activity; the name of the submitting company or organization; and a designated point of contact.
- For NSA client requirements or general cybersecurity inquiries, contact Cybersecurity_Requests@nsa.gov.
- Water and Wastewater Systems Sector organizations, contact the EPA Water Infrastructure and Cyber Resilience Division at watercyberta@epa.gov to voluntarily provide situational awareness.
- Entities required to report incidents to DOE should follow established reporting requirements, as appropriate. For other energy sector inquiries, contact EnergySRMA@hq.doe.gov.
- For transportation entities regulated by TSA, report to CISA Central in accordance with the requirements found in applicable Security Directives, Security Programs, or TSA Order.

Australian organizations: Visit cyber.gov.au or call 1300 292 371 (1300 CYBER 1) to report cybersecurity incidents and access alerts and advisories.

Canadian organizations: Report incidents by emailing CCCS at contact@cyber.gc.ca.

New Zealand organizations: Report cyber security incidents to incidents@ncsc.govt.nz or call 04 498 7654.

United Kingdom organizations: Report a significant cyber security incident: ncsc.gov.uk/report-an-incident (monitored 24 hours) or, for urgent assistance, call 03000 200 973.

VALIDATE SECURITY CONTROLS

In addition to applying mitigations, the authoring agencies recommend exercising, testing, and validating your organization's security program against the threat behaviors mapped to the MITRE ATT&CK for Enterprise framework in this advisory. The authoring agencies recommend testing your existing security controls inventory to assess how they perform against the ATT&CK techniques described in this advisory.

To get started:

1. Select an ATT&CK technique described in this advisory (see Table 5 through Table 17).
2. Align your security technologies against the technique.
3. Test your technologies against the technique.
4. Analyze your detection and prevention technologies' performance.
5. Repeat the process for all security technologies to obtain a set of comprehensive performance data.
6. Tune your security program, including people, processes, and technologies, based on the data generated by this process.

The authoring agencies recommend continually testing your security program, at scale, in a production environment to ensure optimal performance against the MITRE ATT&CK techniques identified in this advisory.

VERSION HISTORY

February 7, 2024: Initial Version.

APPENDIX A: VOLT TYPHOON OBSERVED COMMANDS / LOTL ACTIVITY

See Table 2 and Table 3 for Volt Typhoon commands and PowerShell scripts observed by the U.S. authoring agencies during incident response activities. For additional commands used by Volt Typhoon, see joint advisory People's Republic of China State-Sponsored Cyber Actor Living off the Land to Evade Detection.

Table 2: Volt Typhoon Observed Commands in PowerShell Console History

Command/Script	Description/Use
Get-EventLog security -instanceid 4624 -after {redacted date} | fl * | Out-File 'C:\users\public\documents\user.dat'	PowerShell command extracts security log entries with the Event ID `4624` after a specified date. The output is formatted (`fl *`) and saved to `user.dat`. Potentially used to analyze logon patterns and identify potential targets for lateral movement.
Get-EventLog security -instanceid 4624 | Where-Object {$_.message.contains('{redacted user account}')} | select -First 1 | fl *	PowerShell command extracts security log entries with the Event ID `4624` and filters them to include only those containing a specific user account, selecting the first instance of such an event.
wminc process get name,processid	Appears to be an attempt to use the wmic command but with a misspelling (`wminc` instead of `wmic`). This command, as it stands, would not execute successfully and would return an error in a typical Windows environment. This could indicate a mistake made during manual input.
wmic process get name,processid	WMI command lists all running processes with process names and process IDs. Potentially used to find process IDs needed for other operations, like memory dumping.
tasklist /v	Command displays detailed information about currently running processes, including the name, PID, session number, and memory usage.

Command/Script	Description/Use
taskkill /f /im rdpservice.exe	Command forcibly terminates the process `rdpservice.exe`. Potentially used as a cleanup activity post-exploitation.
ping -n 1 {redacted IP address}	Command sends one ICMP echo request to a specified IP address.
ping -n 1 -w 1 {redacted IP address}	Command sends one ICMP echo request to a specified IP address with a timeout (`-w`) of 1 millisecond.
net user	Lists all user accounts on the local machine or domain, useful for quickly viewing existing user accounts.
quser query user	Displays information about user sessions on a system, aiding in identifying active users or sessions.
net start	Lists all active services.
cmd	Opens a new instance of the command prompt.
cd [Redacted Path]	Changes the current directory to a specified path, typically for navigating file systems.
Remove-Item .\Thumbs.db	PowerShell command to delete the `Thumbs.db` file, possibly for cleanup or removing traces.
move .\Thumbs.db ttt.dat	Relocates and renames the file `Thumbs.db` in the current directory to `ttt.dat` within the same directory.
del .\Thumbs.db /f /s /q	Force deletes `Thumbs.db` files from the current directory and all subdirectories, part of cleanup operations to erase traces.
del ??	Deletes files with two-character names, potentially a targeted cleanup command.

Command/Script	Description/Use
del /?	Displays help information for the `del` command.
exit	Terminates the command prompt session.
ipconfig	Retrieves network configuration details, helpful for discovery and mapping the victim's network.
net time /dom	Queries or sets the network time for a domain, potentially used for reconnaissance or to manipulate system time.
netstta -ano	Intended as `netstat -ano`; a mistyped command indicating a potential operational error.
netstat -ano	Lists active network connections and processes, helpful for identifying communication channels and potential targets.
type .\Notes.txt	Displays the contents of `Notes.txt`, possibly used for extracting specific information or intelligence gathering.
logoff	Logs off the current user session.

Table 3: Volt Typhoon Observed PowerShell Scripts

Script name and location	Contents	Description/Use
C:\{redacted}\ logins.ps1	# Find DC list from Active Directory $DCs = Get-ADDomainController -Filter * # Define time for report (default is 1 day) $startDate = (get-date).AddDays(-1)	The script is designed for user logon discovery in a Windows Active Directory environment. It retrieves a list of DCs and then queries security logs on these DCs for successful logon events (Event ID **4624**) within the last day. The script differentiates

Script name and location	Contents	Description/Use

	# Store successful logon events from security logs with the specified dates and workstation/IP in an array
	foreach ($DC in $DCs){
	$slogonevents = Get-Eventlog -LogName Security -ComputerName $DC.Hostname -after $startDate \| where {$_.eventID -eq 4624 }}
	
	# Crawl through events; print all logon history with type, date/time, status, account name, computer and IP address if user logged on remotely
	
	foreach ($e in $slogonevents){
	# Logon Successful Events
	# Local (Logon Type 2)
	if (($e.EventID -eq 4624) -and ($e.ReplacementStrings[8] -eq 2)){
	write-host "Type: Local Logon`tDate: "$e.TimeGenerated "`tStatus: Success`tUser: "$e.ReplacementStrings[5] "`tWorkstation: "$e.ReplacementStrings[11]
	}
	# Remote (Logon Type 10)
	if (($e.EventID -eq 4624) -and ($e.ReplacementStrings[8] -eq 10)){
	write-host "Type: Remote Logon`tDate: "$e.TimeGenerated "`tStatus: Success`tUser: "$e.ReplacementStrings[5] "`tWorkstation: "$e.ReplacementStrings[11] "`tIP Address: "$e.ReplacementStrings[18]
	}}
		between local (Logon Type 2) and remote (Logon Type 10) logon events. For each event, it extracts and displays details including the logon type, date/time of logon, status, account name, and the workstation or IP address used for the logon. Volt Typhoon may be leveraging this script to monitor user logon activities across the network, potentially to identify patterns, gather credentials, or track the movement of users and administrators within the network.

APPENDIX B: INDICATORS OF COMPROMISE

See Table 4 for Volt Typhoon IOCs obtained by the U.S. authoring agencies during incident response activities.

Table 4: Volt Typhoon Malicious Files and Associated Hashes

Note: See MAR-10448362-1.v1 for more information on this malware.

File Name	Description	MD5	Hashes (SHA256)
BrightmetricAgent.exe	The file is an FRP that could be used to reveal servers situated behind a network firewall or obscured through Network Address Translation (NAT).	fd41134e8ead1c18ccad27c62a260aa6	edc0c63065e88ec96197c8d7a40662a15a812a9583dc6c82b18ecd7e43b13b70
SMSvcService.exe	The file is a Windows executable "FRPC" designed to open a reverse proxy between the compromised system and the threat actor(s) C2 server.	b1de37bf229890ac181bdef1ad8ee0c2	99b80c5ac352081a64129772ed5e1543d94cad708ba2adc46dc4ab7a0bd563f1

APPENDIX C: MITRE ATT&CK TACTICS AND TECHNIQUES

See Table 5 through Table 17 for all referenced threat actor tactics and techniques in this advisory.

Table 5: Volt Typhoon actors ATT&CK Techniques for Enterprise – Reconnaissance

Reconnaissance		
Technique Title	**ID**	**Use**
Gather Victim Host Information	T1592	Volt Typhoon conducts extensive pre-compromise reconnaissance. This includes web searches, including victim-owned sites, for victim host, identity, and network information, especially for information on key network and IT administrators.
Gather Victim Identity Information	T1589	Volt Typhoon conducts extensive pre-compromise reconnaissance to learn about the target organization's staff.
Gather Victim Identity Information: Email Addresses	T1589.002	Volt Typhoon targets the personal emails of key network and IT staff.
Gather Victim Network Information	T1590	Volt Typhoon conducts extensive pre-compromise reconnaissance to learn about the target organization's network.
Gather Victim Org Information	T1591	Volt Typhoon conducts extensive pre-compromise reconnaissance to learn about the target organization.
Search Open Websites/Domains	T1593	Volt Typhoon conducts extensive pre-compromise reconnaissance. This includes web searches, including victim-owned sites, for victim host, identity, and network information, especially for information on key network and IT administrators.
Search Victim-Owned Websites	T1594	Volt Typhoon conducts extensive pre-compromise reconnaissance. This includes web searches, including victim-owned sites, for victim host, identity, and network information, especially for information on key network and IT administrators.

Table 6: Volt Typhoon actors ATT&CK Techniques for Enterprise – Resource Development

Resource Development		
Technique Title	**ID**	**Use**
Acquire Infrastructure: Botnet	T1583.003	Volt Typhoon uses multi-hop proxies for command-and-control infrastructure. The proxy is typically composed of Virtual Private Servers (VPSs) or small office/home office (SOHO) routers.
Compromise Infrastructure: Botnet	T1584.005	Volt Typhoon used Cisco and NETGEAR end-of-life SOHO routers implanted with KV Botnet malware to support their operations.
Compromise Infrastructure: Server	T1584.004	Volt Typhoon has redirected specific port traffic to their proxy infrastructure, effectively converting the PRTG's Detection Guidance server into a proxy for their C2 traffic.
Develop Capabilities: Exploits	T1587.004	Volt Typhoon uses publicly available exploit code, but is also adept at discovering and exploiting vulnerabilities as zero days.
Obtain Capabilities: Exploits	T1588.005	Volt Typhoon uses publicly available exploit code, but is also adept at discovering and exploiting vulnerabilities as zero days.

Table 7: Volt Typhoon actors ATT&CK Techniques for Enterprise – Initial Access

Initial Access		
Technique Title	**ID**	**Use**
Exploit Public-Facing Application	T1190	Volt Typhoon commonly exploits vulnerabilities in networking appliances such as Fortinet, Ivanti (formerly Pulse Secure), NETGEAR, Citrix, and Cisco.
External Remote Services	T1133	Volt Typhoon often uses VPN sessions to securely connect to victim environments, enabling discreet follow-on intrusion activities.

Table 8: Volt Typhoon actors ATT&CK Techniques for Enterprise – Execution

Execution		
Technique Title	**ID**	**Use**
Command and Scripting Interpreter	T1059	Volt Typhoon uses hands-on-keyboard execution for their malicious activity via the command-line.
Command and Scripting Interpreter: PowerShell	T1059.001	Volt Typhoon has executed clients via PowerShell.
Command and Scripting Interpreter: Unix Shell	T1059.004	Volt Typhoon has used `Brightmetricagent.exe`, which contains multiplexer libraries that can bi-directionally stream data over through NAT networks and contains a command-line interface (CLI) library that can leverage command shells such as PowerShell, Windows Management, Instrumentation (WMI), and Z Shell (zsh).
Windows Management Instrumentation	T1047	Volt Typhoon has used Windows Management Instrumentation Console (WMIC) commands.

Table 9: Volt Typhoon actors ATT&CK Techniques for Enterprise – Persistence

Persistence		
Technique Title	**ID**	**Use**
Valid Accounts	T1078	Volt Typhoon primarily relies on valid credentials for persistence.

Table 10: Volt Typhoon actors ATT&CK Techniques for Enterprise – Privilege Escalation

Privilege Escalation		
Technique Title	**ID**	**Use**
Exploitation for Privilege Escalation	T1068	Volt Typhoon first obtains credentials from public-facing appliances after gaining initial access by exploiting privilege

		escalation vulnerabilities in the operating system or network services.

Table 11: Volt Typhoon actors ATT&CK Techniques for Enterprise – Defense Evasion

Defense Evasion		
Technique Title	**ID**	**Use**
Direct Volume Access	T1006	Volt Typhoon has executed the Windows-native `vssadmin` command to create a volume shadow copy.
Indicator Removal: Clear Persistence	T1070.009	Volt Typhoon has selectively cleared Windows Event Logs, system logs, and other technical artifacts to remove evidence of their intrusion activity and masquerading file names.
Indicator Removal: Clear Windows Event Logs	T1070.001	Volt Typhoon has selectively cleared Windows Event Logs, system logs, and other technical artifacts to remove evidence of their intrusion activity and masquerading file names.
Indicator Removal: File Deletion	T1070.004	Volt Typhoon created `systeminfo.dat` in `C:\Users\Public\Documents`, but subsequently deleted it.
Masquerading: Match Legitimate Name or Location	T1036.005	Volt Typhoon has selectively cleared Windows Event Logs, system logs, and other technical artifacts to remove evidence of their intrusion activity and masquerading file names.
Modify Registry	T1112	Volt Typhoon has used the `netsh` command, a legitimate Windows command, to create a PortProxy registry modification on the PRTG server.
Obfuscated Files or Information: Software Packing	T1027.002	Volt Typhoon has obfuscated FRP client files (`BrightmetricAgent.exe` and `SMSvcService.exe`) and the command-line port scanning utility ScanLine by packing the files with Ultimate Packer for Executables (UPX).
System Binary Proxy Execution	T1218	Volt Typhoon uses hands-on-keyboard activity via the command-line and use other native tools and processes on systems (often referred to as “LOLBins”), known as LOTL, to maintain and expand access to the victim networks.

Table 12: Volt Typhoon actors ATT&CK Techniques for Enterprise – Credential Access

Credential Access		
Technique Title	**ID**	**Use**
Brute Force: Password Cracking	T1110.002	Volt Typhoon has exfiltrated `NTDS.dit` and `SYSTEM` registry hive to crack passwords offline.
Credentials from Password Stores	T1555	Volt Typhoon has installed browsers saved passwords history, credit card details, and cookies.
Credentials from Password Stores: Credentials from Web Browsers	T1555.003	Volt Typhoon has strategically targeted network administrator web browser data, focusing on both browsing history and stored credentials.
OS Credential Dumping: LSASS Memory	T1003.001	Volt Typhoon used a DLL with `MiniDump` and the process ID of Local Security Authority Subsystem Service (LSASS) to dump the LSASS process memory and obtain credentials.
OS Credential Dumping: NTDS	T1003.003	Volt Typhoon appears to prioritize obtaining valid credentials by extracting the Active Directory database file (`NTDS.dit`).
Unsecured Credentials	T1552	Volt Typhoon has obtained credentials insecurely stored on an appliance.
Unsecured Credentials: Private Keys	T1552.004	Volt Typhoon has accessed a Local State file that contains the Advanced Encryption Standard (AES) encryption key used to encrypt the passwords stored in the Chrome browser, which enables the actors to obtain plaintext passwords stored in the Login Data file in the Chrome browser.

Table 13: Volt Typhoon actors ATT&CK Techniques for Enterprise – Discovery

Discovery		
Technique Title	**ID**	**Use**
Account Discovery: Local Account	T1087.001	Volt Typhoon executed `net user` and `quser` for user account information.

Application Window Discovery	T1010	Volt Typhoon created and accessed a file named `rult3uil.log` on a Domain Controller in `C:\Windows\System32\`. The `rult3uil.log` file contained user activities on a compromised system, showcasing a combination of window title information and focus shifts, keypresses, and command executions across Google Chrome and Windows PowerShell, with corresponding timestamps.
Browser Information Discovery	T1217	Volt Typhoon has installed browsers saved passwords history, credit card details, and cookies.
File and Directory Discovery	T1083	Volt Typhoon enumerated several directories, including directories containing vulnerability testing and cyber related content and facilities data, such as construction drawings.
Log Enumeration	T1654	Volt Typhoon has captured successful logon events.
Network Service Discovery	T1046	Volt Typhoon has used commercial tools, LOTL utilities, and appliances already present on the system for system information, network service, group, and user discovery.
Peripheral Device Discovery	T1120	Volt Typhoon has obtained the victim's system screen dimension and display devices information.
Permission Groups Discovery	T1069	Volt Typhoon has used commercial tools, LOTL utilities, and appliances already present on the system for system information, network service, group, and user discovery.
Process Discovery	T1057	Volt Typhoon executed `tasklist /v` to gather a detailed process listing.
Query Registry	T1012	Volt Typhoon has interacted with a PuTTY application by enumerating existing stored sessions.
Software Discovery	T1518	Volt Typhoon has obtained the victim's list of applications installed on the victim's system.
System Information Discovery	T1082	Volt Typhoon has used commercial tools, LOTL utilities, and appliances already present on the system for system information, network service, group, and user discovery.

System Location Discovery	T1614	Volt Typhoon has obtained the victim's system current locale.
System Network Configuration Discovery: Internet Connection Discovery	T1016.001	Volt Typhoon employs `ping` with various IP addresses to check network connectivity and `net start` to list running services.
System Owner/User Discovery	T1033	Volt Typhoon has used commercial tools, LOTL utilities, and appliances already present on the system for system information, network service, group, and user discovery.
System Service Discovery	T1007	Volt Typhoon employs `ping` with various IP addresses to check network connectivity and `net start` to list running services.
System Time Discovery	T1124	Volt Typhoon has obtained the victim's system timezone.

Table 14: Volt Typhoon actors ATT&CK Techniques for Enterprise – Lateral Movement

Lateral Movement		
Technique Title	**ID**	**Use**
Remote Service Session Hijacking	T1563	Volt Typhoon potentially had access to a range of critical PuTTY profiles, including those for water treatment plants, water wells, an electrical substation, operational technology systems, and network security devices. This would enable them to access these critical systems.
Remote Services: Cloud Services	T1021.007	During the period of Volt Typhoon's known network presence, there were anomalous login attempts to an Azure tenant potentially using credentials previously compromised from theft of `NTDS.dit`.
Remote Services: Remote Desktop Protocol	T1021.001	Volt Typhoon has moved laterally to the Domain Controller via an interactive RDP session using a compromised account with domain administrator privileges.

Use Alternate Authentication Material	T1550	Volt Typhoon may be capable of using other methods such as Pass the Hash or Pass the Ticket for lateral movement.
Valid Accounts: Cloud Accounts	T1078.004	During the period of Volt Typhoon's known network presence, there were anomalous login attempts to an Azure tenant potentially using credentials previously compromised from theft of `NTDS.dit`.

Table 15: Volt Typhoon actors ATT&CK Techniques for Enterprise – Collection

Collection		
Technique Title	**ID**	**Use**
Archive Collected Data	T1560	Volt Typhoon collected sensitive information obtained from a file server in multiple zipped files.
Archive Collected Data: Archive via Utility	T1560.001	Volt Typhoon has compressed and archived the extracted `ntds.dit` and accompanying registry files (by executing `ronf.exe`, which was likely a renamed version of `rar.exe`).
Data Staged	T1074	Volt Typhoon accessed the file `C:\Users\{redacted}\Downloads\History.zip`, which presumably contained data from the User Data directory of the user's Chrome browser, which the actors likely saved in the Downloads directory for exfiltration.
Screen Capture	T1113	Volt Typhoon has obtained a screenshot of the victim's system using two libraries (`gdi32.dll` and `gdiplus.dll`)

Table 16: Volt Typhoon actors ATT&CK Techniques for Enterprise – Command and Control

Command and Control		
Technique Title	**ID**	**Use**
Encrypted Channel	T1573	Volt Typhoon has setup FRP clients on a victim's corporate infrastructure to establish covert communications channels for command and control.

Ingress Tool Transfer	T1105	Volt Typhoon uses legitimate, but outdated versions of network admin tools. For example, in one confirmed compromise, actors downloaded an outdated version of `comsvcs.dll`, on the DC in a non-standard folder.
Proxy	T1090	Volt Typhoon has setup FRP clients on a victim's corporate infrastructure to establish covert communications channels for command and control.
Proxy: Internal Proxy	T1090.001	Volt Typhoon has used the `netsh` command, a legitimate Windows command, to create a PortProxy registry modification on the PRTG server.
Proxy: Multi-hop Proxy	T1090.003	Volt Typhoon uses multi-hop proxies for command-and-control infrastructure.

Table 17: Volt Typhoon actors ATT&CK Techniques for Enterprise – Exfiltration

Exfiltration		
Technique Title	**ID**	**Use**
Exfiltration Over Alternative Protocol	T1048	Volt Typhoon exfiltrated files via Server Message Block (SMB).

13. ABSTRACT (maximum 200 words)

The use of social media has been growing every year since its inception. With that, individuals, organizations, businesses, and nations have created clever ways to spread messages to large audiences; however, in the last decade, those same entities have begun utilizing social media to spread false narratives that fit their agenda. Using Tweets and memes, non-state and state actors have successfully influenced elections, incited riots, and increased membership. Current academic research does not describe who is most susceptible to this new type of information disorder. For that reason, the experiment detailed in this thesis was designed to aid information environment researchers in identifying groups that are most susceptible to information disorder; when conducted, it will reveal correlations between the acceptance and propagation of false information spread through Tweets and memes and the age group, gender, and education level of those most likely to interact with the false information. Once complete, defensive and offensive measures can be put in place by individuals, organizations, businesses, and nations to defend or attack the most at-risk groups.

I. INTRODUCTION

A. SOCIAL MEDIA, THE NEWS, AND MARKETING: WHAT COULD GO WRONG?

According to a 2019 study by the Pew Research Center, 55% of U.S. adults get their news from social media (Suciu, 2019). This figure is up 8% since 2018 and has likely increased more due to the 2020 global pandemic (Suciu, 2019). Currently, Facebook accounts for 52% of said news, while Twitter is at 17% and Instagram is 14% (Suciu, 2019). In addition to news, many social media users are seeking product discovery (Gorman, 2021). According to Global Web Index, a leading marketing firm for targeted advertisements, 42% of individuals use social media for brand/merchandise research and roughly "24% of global internet users have clicked on a sponsored post or ad on social media" during any given month (Gorman, 2021, sec. "Who clicks on social media ads?"). Although many people assume that articles are the main source of news, and digital marketing advertisements for product sales, short text blurbs, like Tweets (Figure 1), and quick scroll images, like image macro memes (Figure 2), are becoming a mainstream and rapid source for current events and brand awareness (Boulter & Bolaji, 2020; Mottola, 2020). Occasionally, the worlds of social media advertising and news will collide, utilizing algorithms (discussed in Chapter II) to target certain audiences for bipartisan or social justice topics (Weise, 2018). Unfortunately, this type of intersection creates a massive vulnerability to American citizens, opening them up to influence campaigns run by external groups.

While social media does a great job of disseminating word rapidly and to a number of audiences, this form of mass distribution opens doors for a new type of information operation. Russia, a nation on the forefront of this movement, has been infiltrating social media for many years (Wardle & Derakhshan, 2017). Notably, as described in a Senate Intelligence Committee report, the 2016 election was fraught with memes and Twitter accounts propagating false information aimed at dividing our nation (2019). Much of this misinformation took the form of targeted advertisements, like the one beginning with "African-Americans have to choose between old Hillary Clinton and rich Donald Trump,"

Page 2473 of 3957

that was directly displayed to Facebook users identifying as Hispanic, Asian American, or African-American (Weise, 2018, para. 8). Furthermore, after seemingly failed influence attempts, China agreed to work with Russia in current and future information operations against the Western nations, who they claim to have distorted the narrative around the current global pandemic (Weitz, 2020). With that in mind, it is safe to say that foreign actors have successfully attempted to influence the thoughts and actions of American citizens, and they will only improve at it. These tools (i.e., Tweets, memes, and targeted advertisements) are assisting our peer-adversaries in completing their mission, making it vitally important that we understand who is most susceptible to online delivered information weapons.

B. KEY INFORMATION DISSEMINATION TOOLS: TWEETS AND IMAGE MACRO MEMES

Using no more than 280 characters at a time, Twitter (2021a), an online social media platform, allows users to instantly express their thoughts and feelings to the world at large, describing themselves as serving public conversations. The organization believes "you should be able to speak your mind and find credible information easily" (Twitter, 2021c, sec. "Healthy conversations"). The Twittersphere is not exclusive to individual users; companies and organizations may use the platform to promote new products, share news articles, or show support for current change initiatives. Figure 1, containing a real Tweet from *The New York Times* Twitter page, is annotated to pinpoint specific aspects of Tweets that, as detailed in a later chapter, were altered during creation of the false Tweets in the experimental design of this thesis.

Page 2474 of 3957

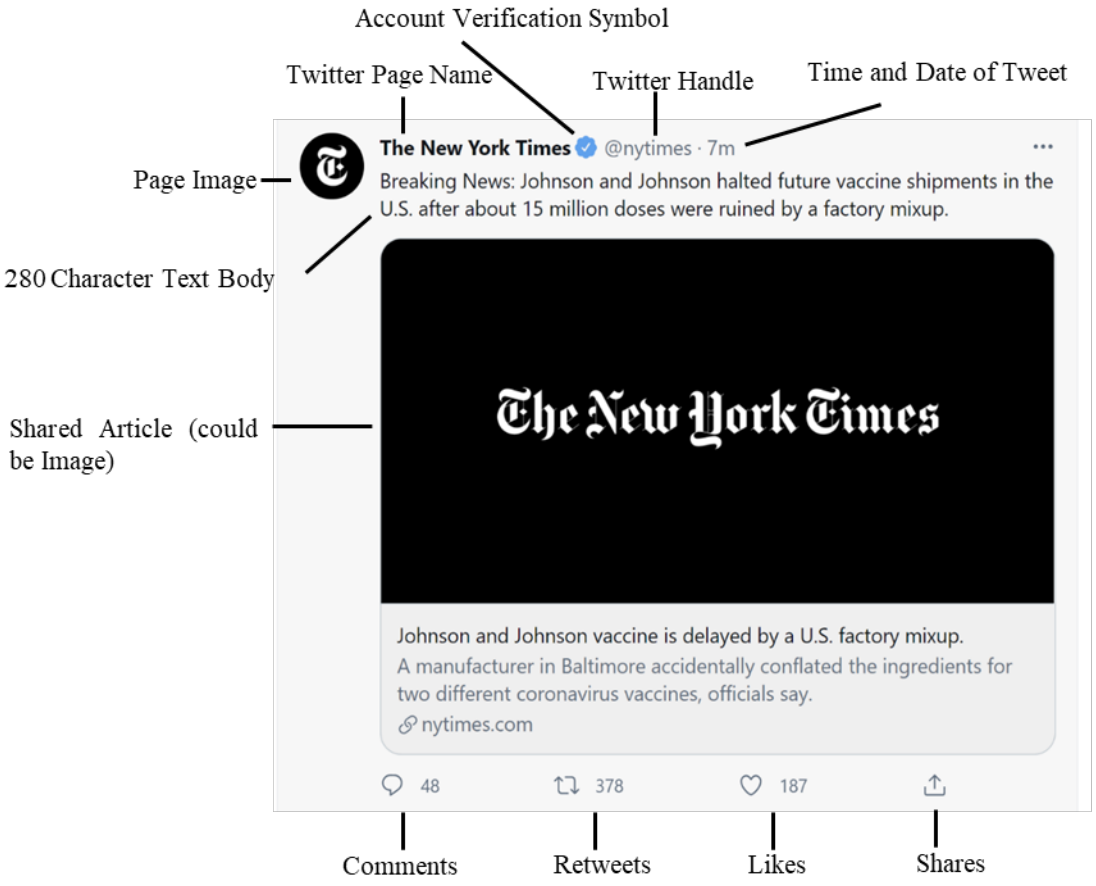

Figure 1. A breakdown of a Tweet. Adapted from Twitter (2021).

Image macro memes, like Figure 2, are likely what comes to mind when the word "meme" is used in conversation or writing; they contain text on top of a widely distributed photograph (Mina, 2019). For that reason, image macro memes are what will be used for this experimental design. However, these digital objects consist of more than images with text, encompassing videos, performances, and selfies as well (Mina, 2019). Image macro memes appear on all social media platforms, including Twitter, Facebook, Instagram, Tik Tok, Reddit, etc., and may be shared by any user in a matter of seconds.

Page 2475 of 3957

Figure 2. Image macro meme

C. WHAT MAKES MEMETIC RESEARCH IMPORTANT?

Whether a social media user is on Twitter, Facebook, Instagram, or another popular application, they are bound to see memes daily. These memes, even if the viewer does not realize it, are being created with specific goals in mind; through humor and irony (Burroughs, 2020), memes serve as marketing strategies, evident by Fashion Nova's Instagram takeover (Raaf, 2018), political campaign ads and propaganda (Burroughs, 2020), extremist recruitment (Zitser, 2021), or foreign influence tools (Wardle & Derakhshan, 2017). Because this information dissemination tactic has evolved from simple humorous and ironic images into manipulation techniques, it is paramount that society gain a better understanding of how they propagate.

With undeniable benefits to marketing on social media, it is not surprising that 96% of small businesses use it for their marketing strategy (Shepherd, 2021). In fact, social media marketing use drives an increase in customer loyalty, leading consumers to spend

40% more money once engaged with the business via a follow, like share, etc. (Shepherd, 2021). Because the preponderance of social media users are on the applications to laugh, memes as a marketing tool are growing in popularity (Sprout Social, 2018). Brands ranging from Slim Jim to BarkBox are currently utilizing image macro memes (Barker, 2021) like the ones displayed in Figure 3. Slim Jim, whose official Instagram page is covered in image macro memes, has amassed a following of 1.3 million people (slimjim, 2021). With such a large following, Slim Jim holds a lot of influence; if they chose to start posting politically driven memetics vice meat stick centric ones, there is no telling what impact they would have. Luckily, however, most companies leave the controversial memes to individual users, extremist groups, or foreign state actors, who may or may not have a following near that of Slim Jim.

Figure 3. Slim Jim and BarkBox image macro memes. Source: Slimjim (2021) and BarkBox (2021).

According to the *Washington Post*, the 2016 political primaries were "the most-memed election in U.S. history" (Heiskanen, 2017, p. 1). However, one can make a case that the 2020 election took the crown; upon a quick Google search, millions of articles appear characterizing an abundance of memes from the most recent presidential election.

Page 2477 of 3957

For example, *Inside Hook* published a piece entitled "Election Week 2020, As Told in Memes," while *Cosmopolitan* wrote "These 2020 U.S. Presidential Election Memes Will Keep You Laughing Until Inauguration Day" (Isaac, 2020; Mahan, 2020). Prior to the 2020 election, copious amounts of politically driven memetics tended to point out candidate hypocrisy or critique policy positions (Heiskanen, 2017). Due to the lack of literature surrounding the most recent election, it is difficult to say whether the 2020 memes were focused on the same central points. However, upon review of the two articles mentioned above, the 2020 election may have encompassed a wider breadth of topics, like the removal of Donald Trump from office (Isaac, 2020). Interestingly, politically driven memes like the ones mentioned propagate quicker within groups of the same political ideology, making it difficult to tell whether they influence voter action (Heiskanen, 2017). Despite the uncertainty behind the influential factor of memetics, many extremist groups and foreign actors still use them to gain group members or push narratives that benefit them (Graff, 2018).

According to the CEO of the Center for Countering Digital Hate (CCDH), a not-for-profit organization aimed at "disrupting the architecture of online hate and misinformation" (CCDH, 2021, sec. "About"), "Instagram is actively pulling its predominantly young users down an extremist rabbit hole" (Zitser, 2021, para. 5). At the forefront of these extremist groups is the neo-Nazis (Zitser, 2021). HOPE Not Hate, a United Kingdom based group focused on defeating extremism (HOPE not hate, 2021), names Instagram as the "platform of choice" for radicalizing the young generation into neo-Nazi supporters (Zitser, 2021, para. 7). According to a researcher at HOPE Not Hate, memes are the easiest way to spread these ideologies, allowing propagators to hide extremism under humor and irony (Zitser, 2021). Once a user interacts with extremist posts on Instagram, the algorithm pushes like-information to the "explore" page on the users individual account, only increasing the content they encounter (Warren, 2021). According to the social media site itself, "interest" is the number one driving factor for feed posts, pushing items believed to be "liked" by the user to the top of their screen (Warren, 2021). This means that, while one individual may see cookie decorating and cake baking, another user will view neo-Nazi and racially charged hate.

If extremist groups are using memetics to boost membership, it should come as no surprise that foreign actors, specifically Russia and China, are using them to spread propaganda and pit our nation against itself (Gaff, 2018; Kao & Li, 2020). In fact, an attempt at destabilization through predominantly politically driven misinformation memetics has become commonplace (Weitz, 2020). Things like political candidates, second amendment rights, and even the COVID-19 pandemic are drivers for foreign influence operations (Weitz, 2020; Wyrich, 2017). For example, in Hong Kong, a number of students rapidly spread COVID-19 memes with hashtags that placed blame on China and its people, hoping to continue longstanding anti-Chinese movements in the area (McMinn, 2020). As discussed, however, the effectiveness of memes at dividing a nation is unknown (Heiskanen, 2021); this thesis and experimental design will address this gap in the literature.

D. PROBLEM STATEMENT

Memes have taken center stage in discussions about marketing, politics, extremist recruitment, foreign state actors, and even the COVID-19 pandemic (Burroughs, 2020). The memes, which include a combination of perceptual cues/elements (Figure 2), traditionally manifest themselves as images, texts, videos, performative pieces, and selfies (Mina, 2019). However, despite their immense popularity in social media and online environments, the field remains understudied. This omnipresence of memetics gives rise to an important question: How do memes affect the acceptance and propagation of false information? If it is determined that including memes in perceptual stimuli can give rise to systemic variation by age, gender, and education level when propagating false information, they can be used as leverage in all the methods listed above, especially influence operation targeting endeavors.

E. PURPOSE STATEMENT

The purpose of this thesis is to design an experiment that explores how memes affect the acceptance and propagation of the false information within various ages, education levels, and gender groups, when compared to text blurbs (Tweets) alone. In order to achieve that, an experiment was designed through the Naval Postgraduate School via the

Page 2479 of 3957

online experimental platform Qualitrics, which, when performed, may be delivered via Mechanical Turk (MTURK). The independent variables are the age, education level, and gender, which are provided by the experiment participants. The dependent variable is the participant willingness to interact with the presented Tweets and memes and their reason for doing so. The manipulated variable is the presentation of Tweets and image macro memes that contain false information.

F. RESEARCH DESIGN

After completing an in-depth literature review, this thesis utilizes experimental design to address the purpose and problem statements. It expounds upon how the experiment was built, including the reasoning for every single Tweet and meme contained. Following methods, the implications for completing the experiment and recommendations for future work are detailed. The overarching experimental design for this thesis focuses on answering the below hypotheses through an analysis of various participant response to a series of Tweets and image macro memes riddled with false information. The survey created helps researchers examine whether age, education level, and/or gender correlates to the acceptance and propagation of false information spread through image macro memes, comparing it to the acceptance and propagation of false information spread exclusively through text blurbs. Additionally, as summarized in Chapter III, it will test the effects of initial categorization on survey response. The experiment's null hypothesis is that age, education level, and gender have no influence on the rate of acceptance of false information via memes. This experiment is designed to test the following hypotheses:

- HA1: Age correlates to the acceptance of false information spread through a Tweet and an image macro meme.
- HA2: Education level correlates to the acceptance of false information spread through a Tweet and an image macro meme.
- HA3: Gender correlates to the acceptance of false information spread through a Tweet and an image macro meme.

Page 2480 of 3957

- HA4: Age correlates to the propagation of false information spread through a Tweet and an image macro meme.
- HA5: Education level correlates to the propagation of false information spread through a Tweet and an image macro meme.
- HA6: Gender correlates to the propagation of false information spread through a Tweet and an image macro meme.
- HA7: Initial categorization has an effect on the acceptance of false information spread through Tweets and image macro memes.
- HA8: Memes will be interacted with (by indication of liking, commenting, or sharing) at a different rate than Tweets.

II. BACKGROUND

To better understand the interplay of social media and influence, a deep dive into the topics of social media, memetics, information disorder, and initial categorization is necessary. By unraveling intricacies within the aforementioned topics, one will gain a better understanding of the literature review in Chapter III and the thought process behind the experimental design detailed in Chapter IV.

A. THE RISE OF SOCIAL MEDIA

While social networking took root in the 1960s with the invention of ARPANET, most social media sites were not built until the 1990s, lining up with the commercial launch of the internet (Edosomwan et al., 2011). Although many social media platforms came before it, MySpace was the most popular social media site in the United States until 2008, when Facebook took over (Edosomwan et al., 2011). Currently, YouTube, Facebook, and Instagram are the most commonly used platforms, with over 40% of all adults using all three applications (Auxier & Anderson, 2021). Twitter, the seventh most popular site, is being used by 23% of adults (Auxier & Anderson, 2021). Naturally, with such a large number of users, social media comes with pros and cons; while these platforms allow individuals from all over the world to connect and find common ground on various topics, it has been shown to increase depression and anxiety, as well as lower sleep quality and self-esteem in its users (Mammoser, 2018). Depression, anxiety, and low self-esteem tend to occur when users over analyze their lives versus another user's life (Mammoser, 2018). Additionally, it has been determined that covering distressing events via media, whether it be posts online or news casts, is harmful to viewers, sometimes even leading to higher acute stress than being at the distressing event itself (O'Brien et al., 2020). Despite knowing that, social media use has been on a steady rise since its inception (Auxier & Anderson, 2021), forming communities for people, serving as a platform for activism and politics, and helping organizations/companies market products and ideas.

Page 2483 of 3957

1. Social Media as a Community

With the rise of social media, researchers began looking into Twitter, Facebook, Instagram, and all other platforms for signs of online communities. What they found was, through the social network perspective, many groups on social media meet the requirements to be considered a community (Gruzd & Haythornthwaite, 2013). By identifying the actors, informal and formal ties, roles, and cliques formed on these sites, one can begin to see how seemingly random interactions may grow into full communities (Gruzd & Haythornthwaite, 2013). For example, two million people follow the account "WeRateDogs" on Instagram. On Twitter, nine million people follow the same account, ran by the same individual. Every day, followers will send pictures of their dogs to Max, the account owner, and he posts them for all to see. The hashtags, which may include something like "#seniorpupsaturday" is then used by those in Max's community, which is evident by clicking on said hashtag and reviewing the similar posts (WeRateDogs, 2021c). In addition, Max has created a merchandise line that all followers can immediately recognize; his "tell your dog I said hi" decals and masks easily help identify members of the WeRateDogs community (WeRateDogs, 2021a). Finally, Max regularly posts GoFundMe pages for dogs in need of medical care, which always get fully funded in under thirty minutes (Weratedogs, 2021b). This example highlights the exchange of information, social support, and play that occurs between members of the WeRateDogs community, legitimizing social media as a community through the lens of the social network perspective (Gruzd & Haythornthwaite, 2013).

2. Social Media and Activism

From the inception of social media, people have been using the platforms to spread awareness for social issues (Weise, 2018). In 2020 alone, nearly a quarter of users changed their viewpoints on a social justice topic based on posts reviewed on one of the many platforms (Perrin, 2020); most of those users stated that "Black Lives Matter" (BLM) as the driver for that change (Perrin, 2020). BLM, which began in 2014 after the deaths of Michael Brown and Eric Garner, started as a movement on Twitter (Carney, 2016). Since 2014, BLM has made multiple resurgences, the most recent beginning in 2020 with the

Page 2484 of 3957

death of George Floyd (McLaughlin, 2020). After the video of George Floyd's death circulated rapidly via social media, more than 20 million people began protesting throughout the United States (McLaughlin, 2020). Despite a worldwide pandemic, this social justice issue, which began and spread via social media, was able to move millions to action, truly highlighting the power of these platforms. Nikita Carney, a researcher with the University of California, Santa Barbara and Louisiana State University, believes this occurs because social media has increased the accessibility to information that previously prevented citizens without access to information from having opinions (2016). While BLM is not the only social issue that has been elevated to grand heights by social media, it is the most influential one to occur in the last year.

3. Social Media and Political Appointees

United States political candidates and elected officials rely heavily on social media to reach a broader public. As of April 2021, the official White House Instagram (@whitehouse) account has over six-million followers, and President Joe Biden (@joebiden) and Vice President Kamala Harris (@kamalaharris) have a combined total of over 32 million followers. On Twitter, the two leaders have just under that same mark (2021). While the use of social media platforms started with former President Barack Obama, his successor, Donald Trump, was the one to employ it nearly every few hours for four years, setting a new precedent (Wharton Business Daily, 2020). Through research efforts, it has been shown that appointed officials actually get large increases in support when they utilize this new communication tool (Wharton Business Daily, 2020). This support increase is hypothesized to occur due to the feeling of accessibility that it brings to constituents (Wharton Business Daily, 2020). Additionally, the utilization of social media by political newcomers may help reduce the barrier to entry into political circles, giving hopefuls a voice and platform without the large funding requirements in the past (Wharton Business Daily, 2020).

4. Social Media and Marketing

Social media marketing may have started as emplaced advertisements, but it now encompasses that and much more; influencers, who are social media users with followings

Page 2485 of 3957

large enough to shape attitudes, partner with brands to bring awareness to products and lifestyle trends (Glucksman, 2017). Through tracking software that monitors engagement with a sponsored post, influencers are able to make money from their partners (Glucksman, 2017). According to experts, for a sponsored post, Instagram influencers should receive $1,000 per 100,000 followers, which allows these individuals/accounts to make a living doing this type of marketing (Mathew, 2018). However, not only is influencer marketing good for the influencer, but 89% of marketers have seen equal or improved return on investment when compared to other marketing techniques (MediaKix, 2019).

Who are these influencers then? Well, some of the most successful ones are seemingly normal accounts that rise to influencer level, not pop culture celebrities (Jin et al., 2019). This is because, as research has shown, people who are perceived to be "normal" or "one of us" are viewed as more sociable and trustworthy to social media users, making them better candidates for marketing partnerships (Jin et al., 2019). While the obvious influencer is the popular person, like Alicia McCarvell who has over 300,000 followers (aliciamccarvell, 2021), other influencers include accounts like @sarcasm_only or @betches, who keep themselves relatively anonymous and post predominantly comedy and meme driven media to their multi-million user followings (2021).

B. WHAT MAKES A MEME, A MEME?

In 1978, Richard Dawkins began using the word "meme" to describe cultural actions that disseminate like genetic material (Mina, 2019). The term has since been coined as the internet phenomenon that describes digital objects sharing the common characteristics of transformation, awareness, imitation, and circulation (Mina, 2019). Those digital objects can take the form of images, texts, videos, performative pieces, and selfies (Mina, 2019). While all listed instances are covered under the formal definition of meme, the image is the most recognizable and the selected independent variable for this study. The image is broken down into two forms: image meme and image macro (Mina, 2019). When an image meme includes text, it becomes an image macro, as shown in Figure 2 (Mina, 2019). Because any individual can create a meme whenever they desire (through websites like imgflip.com), it is very difficult to get an accurate number of their existence

Page 2486 of 3957

online; however, over two years ago, researchers at University College London were able to easily collect 100,700,000 image macro memes for analysis (Cole, 2018). While readers can reflect on that number and hypothesize how many memes exist today, one can assume that the market is saturated.

Although memes are short units of information, they generally convey a specific narrative (Saint Laurent et al., 2021). These narratives, while predominately humorous or ironic, require that the viewer have an established knowledge base in the topic presented (Saint Laurent et al., 2021). While these digital artifacts do not present a plot like those of traditional stories, they do formulate with a beginning, middle, and ending in mind (Saint Laurent et al., 2021). Additionally, memes tend to reference specific characters, like Kermit sipping tea, helping to bring meaning to a variety of topics based on similar context (Saint Laurent et al., 2021). Despite the lack of a central axis, the character development and crossover, as well as the structured manner in which memes fade in and out of relevancy, equates them to mini stories (Saint Laurent et al., 2021).

While image macro memes can be made and posted to Twitter, Instagram, Reddit, 4Chan, etc., by anyone, they are not guaranteed to be seen by a wide audience (aka go "viral"). According to Lin Wang and Brendan Wood, both researchers at the University of New Brunswick, meme propagation occurs like an infectious virus; through social interaction, meme spread spikes early (infectious stage) but begins to decay once a certain number of people have reviewed the content or it begins to lack relevancy (2011). To prove their claim, Wang and Wood utilized a modified susceptible, infective, and recovered (SIR) compartmental modeling approach, which is commonly used by epidemiologist to compute virus spread (2011). Using the Google Trends tool, the researchers were able to utilize historical search data to graphically depict the spread of popular topics (Wang & Wood, 2011). As hypothesized, Wang and Wood found that search volume spikes sharply within the first days that a newly introduced idea becomes content, then begins to taper off after the allure has run out (2011). Recently, however, this concept of going "viral" is being scrutinized by internet culture enthusiasts.

Abby Ohleheiser, a senior editor for the *MIT Technology Review*, makes a case for abolishing the use of the term "viral," and it is not simply because of the real virus

Page 2487 of 3957

spreading throughout the world (2020); Abby, through a conversation with Whitney Phillips, a Syracuse university assistant professor, discusses that "viral" should be reserved for popular online digital objects that contain misinformation (2020). Whitney Phillips points out that, because spreading misinformation, whether knowingly or not, causes harm, like a real virus does, the term should be reserved solely for those instances (Ohleheiser, 2020). Additionally, Ohleheiser considers the role that algorithms play in propagating memetics; as she states, "authentic popularity isn't necessarily real: algorithms incentivize content that people are going to engage with, accelerating its spread, and people have gotten really good at manipulating [it]" (2020, sec. "Manipulated popularity").

Social media algorithms, like those mentioned by Abby Ohleheiser, drive what content a user sees by analyzing what kinds of posts they interact with regularly (Etter & Albu, 2021). Traditionally, a user will notice that their content is personalized, displaying memes that center on topics they commonly like, share, and comment on (Etter & Albu, 2021). The coding for these algorithms allows users to become stuck in loops that display only one or two topics, giving rise to organized collectives of like-minded users (Etter &Albu, 2021). As briefly discussed in Chapter I, this continual reemphasis of specific content may expose certain users to constant extremist viewpoints, like Instagram and neo-Nazism (Zitser, 2021).

From its start in 2010, Instagram has amassed over one billion users (Mohsin, 2021). Of those users, 71% are age 34 or younger and spend a daily average of 53 minutes on the application (Mohsin, 2021). While those numbers sound shocking, the age group and usage time do not account for the 2020 global pandemic stay-at-home orders and have likely increased in the last year. When a user first signs up for an Instagram account, they begin following other accounts and posting to their feed. The accounts range from favorite celebrities, clothing brands, activist groups, political ideations, humor, and many more. Commonly, a user will find a form of memetic on every type of account; whether it be the recreation of popular internet dances, ironic image macro memes making fun of the president, or 10 second videos promoting a new product, a user is not likely to use Instagram without seeing a number of memes. Facebook, another top social networking platform, accounts for the preponderance of these types of digital objects. Much like

Page 2488 of 3957

Instagram, by allowing users to like, share, and comment on things, Facebook enables meme propagation at a very high rate.

What, then, is the algorithm influenced saturated meme market sharing with the world? Well, image macro memes tend to promote products, meld ideologies together, and encourage social activism. Through memetic marketing, like the examples shown in Figure 3 (Slim Jim and BarkBox), companies are able to increase consumer attitudes towards a product, which leads to an increase in purchases (Lee et al., 2019). Co-authors Lee, Liang, Liao, and Chen were able to show this concept by surveying 380 Taiwanese Facebook users about their thoughts towards internet marketing memes (2019). By focusing on both utilitarian attitudes, like functionality representation, and hedonic attitudes, like a representation of fun, the researchers were able to conclude that companies who create memes with hedonic attitudes as the focus can boost online purchases (2019).

Interestingly, memes as marketing strategies are being utilized worldwide, not exclusively in the United States and Asia. In India, a prominent influencer marketing company called Buzzoka has begun meme incorporation (BW Online Bureau, 2020). In fact, their CEO Ashutosh Harbola was quoted saying, “Memes have a definite potential to become a major phenomenon and we as a company are committed to taking the first foot forward” (BW Online Bureau, 2020, para. 4). SBI, after experiencing wide success from a previous meme driven campaign, joined in on a viral Pakistani meme called “Pawri,” which was initially circulated by Pakistani influencer Dananeer Mobeen (The International News, 2021). This “Pawri” meme, meaning “party” in Urdu, was then embraced by a multitude of Pakistani and Indian companies, like Netflix India, Zomato, Swiggy, and Oyo Rooms (News18, 2021). The ability for India and Pakistan to find common ground via memetics, despite the possibility of warfare between the two nations (National Intelligence Council, 2021), highlights the online significant influence generated through memetics.

It is important to understand how memetics drive narratives for controversial topics associated with politics and religion. As stitching devices, memes blend multiple internet platforms, narratives and ideologies, and geopolitics together, unifying people based on shared digital media (Burroughs, 2020). These stitched devices then become calcified and weaponized ideology (Burroughs, 2020); this commonly occurs in politics, like what was

Page 2489 of 3957

seen during the 2016 election season (Figure 4). Too often, memes stitch politics with religion, which is demonstrated rather frequently by conservative individuals or foreign state actors (Burroughs, 2020). Summarily, Benjamin Burroughs, an emerging media researcher for the University of Nevada, explains that "memes have expanded beyond popular culture and humor, they [have] become the grounds for social activism, merging the political and social" ideals (2020, pp. 191-200); this description raises the question that, if memes are now used for social activism, politics, and marketing, what effect do they have on propagating false information online?

Figure 4. 2016 Election meme created and propagated by foreign state actors. Source: *National Post* Staff (2017).

C. WHAT IS INFORMATION DISORDER?

To grasp a better understanding of a particular environment, an individual must gather information (Nissen, 2014); according to Mark Nissen, a professor at the Naval Postgraduate School, one is said to have gathered information when they can glean meaning from a situation (2014). For example, if you were to give the number 120/80 to a

person on the street, they would not know what you wanted them to do with it (Nissen, 2014). Are they dividing 120 by 80? Is it some sort of ratio? After telling the individual that 120/80 is a blood pressure reading, the numbers are transformed from data to information (Nissen, 2014). Depending on the level of knowledge the person has on blood pressure, they can determine what to do with said information (Nissen, 2014). As mentioned previously, memes act as stitching devices, pulling different ideologies and narratives together. Thus, unless a meme viewer can place meaning behind the digital object, the image is simply data, not information. The issue then becomes this: Is the meaning a viewer places on the meme accurate or is the creator attempting to create a false meaning in the viewers mind? If the meaning gleaned from the meme is untrue, the creator has succeeded in employing information disorder.

In 2017, Claire Wardle and Hossein Derakhshan created a new conceptual framework to examine information disorder (Figure 5). This framework breaks down the spread of false information into three categories: misinformation, disinformation, and malinformation and classifies them as "false" and/or "harmful" (cause an adverse effect) (Wardle & Derakhshan, 2017). Misinformation is the spread of false information without the intent of causing an adverse effect, or harm (Wardle & Derakhshan, 2017). Disinformation, on the other hand, is the spread of false information with the intent to cause harm (Wardle & Derakhshan, 2017). Finally, weaponized true information, known as Malinformation. that is spread with the intent to cause an adverse effect, will traditionally appear out of context and frame the information in a way that is no longer truthful (Canan & Akil, 2020; Wardle & Derakhshan, 2017). Commonly, individuals refer to the notion of information disorder as "fake news," which poorly describes the complexities of this domain and encourages a lack of trust in mainstream media (Wardle & Derakhshan, 2017). In an attempt to prevent the undermining of free press, the term information disorder (or one of the three respective types of information), vice fake news, will be used throughout this thesis.

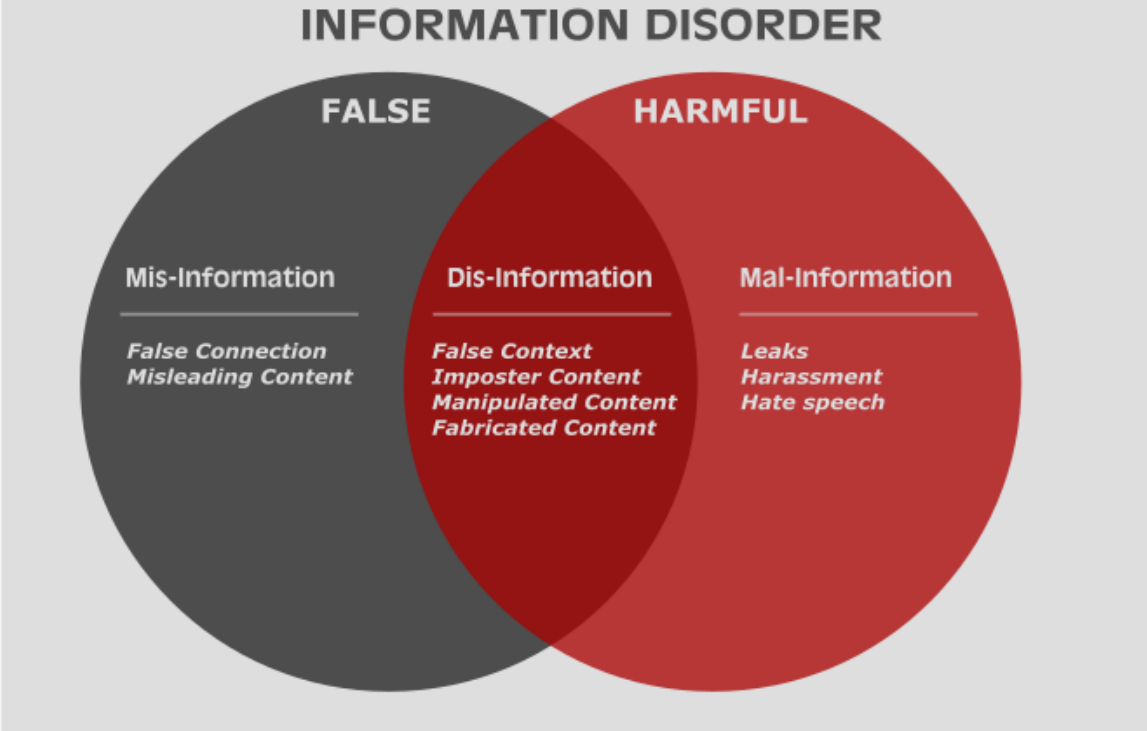

Figure 5. Components of information disorder. Source: Wardle and Derakhshan (2017).

This concept of information disorder is commonly applied in politics (Andrejevic, 2020), journalism (Wardle, 2020), and even marketing (Liu et al., 2020). In fact, according to former President Obama's communications director Dan Pfeiffer, "every policy, speech, interview, Tweet, meme, video, and photograph needs to be thought of as a piece of content that can be used to persuade voters" (Pfeiffer, 2020, para. 7). In the current political realm, information disorder serves a predominant right-leaning audience with an overall goal of preventing change rather than calling for it (Andrejevic, 2020). Commonly, a disinformation creator will weaponize irony, praying on preexisting prejudices with a focus on what can be achieved through widespread distribution (Andrejevic, 2020). For example, in 2018, Cambridge Analytica, a data firm utilized by former President Donald Trump's campaign, was shown to have collected social media information on 50 million Americans in hopes of using it to manipulate voters (Rushkoff et al., 2018). This realization led Congress to call upon Facebook CEO Mark Zuckerberg to testify on his company's data collection practices (Rushkoff et al., 2018). To combat the use of political information

disorder, Mark Andrejevic, a communications and media studies professor and researcher, states that we must develop conditions for recognition vice countering information disorder with more information disorder (2020).

Journalism, which can encompass political information disorder, constitutes a much larger realm of misinformation and disinformation (Wardle, 2020); journalism opens the door to false narratives about any topic, whether it be celebrity news or the COVID-19 pandemic (Wardle, 2020). During the era of former president Donald Trump, "fake news" became a way to describe subpar reporting by journalist in mainstream media (Wardle, 2020). However, "fake news" in journalism truly refers to information disorder and consists of manipulation in the form of "satire, clickbait, inaccurate captions, visuals, statistics, genuine content shared out of context, manipulated quotes and imagery, and outright fabricated stories" (Wardle, 2020, pp. 71-85). In order to combat this issue, Claire Wardle, the co-founder and Leader of the non-profit mis and disinformation research organization *First Draft*, recommends more research into the scale and complexities of information disorder (Wardle & Derakhshan, 2017).

Finally, marketing, which may not be the first topic of conversation when discussing information disorder, constitutes of a large number of campaigns (Newsguard, 2021). For example, researchers Jessica Liu, Sheila McLaughlin, Adrienne Lazaro, and Bonnie Halper-Felsher investigated the marketing of e-cigarettes and marijuana use, which focuses predominantly on young adults (2020). Recognizing that social media has led to a drastic increase in the use of said smoking products, the four women set out to determine what appealed to users most (Liu et al., 2020). Through a series of interviews, they were able to conclude that tobacco and marijuana users were exposed to information about the products without even subscribing to them (Liu et al., 2020). In fact, memes were one of the most widely used digital objects leading adolescents to exposure on the subject matter (Liu et al., 2020). Interestingly, however, "participants reported awareness of the tobacco industry's underlying profit-driven motives" but chose to partake anyway (Liu et al., 2020, sec. "Lack of trust in industry"). Additionally, the participants appeared to rely heavily on their friends and social media influencers for "credible" information about e-cigarettes and marijuana use (Liu et al., 2020). The research goes on to state that "recent evidence that

Page 2493 of 3957

companies such as JUUL [e-cigarettes] use celebrities and young-looking influencers plays into this idea of trusting the source" (Liu et al., 2020, sec. "Discussion"). Liu et al.'s research accurately represents the idea that corporations, through memes and social media, can utilize information campaigns to their advantage; despite the research suggesting long-standing health problems from smoking (Blaha, 2021), they are still able to mold a narrative and sell products.

Allowing information to flow without many restrictions, like what occurs online and on social media, leads to issues for individuals attempting to sort fact from fiction. The predominance of problems that arise when analyzing information disorder occur in the mass communication and media psychology fields (Bowman & Cohen, 2020). According to Nicholas Bowman and Elizabeth Cohen, individuals face issues detecting false information due to the following reasons: cognitive dissonance, confirmation biases, cognitive shortcuts, emotional responses, social influences, mistrust, and misunderstandings (2020). After detailing the correlations between the aforementioned terms and information disorder, the authors acknowledge that they have no answers to solve the underlying problem (Bowman & Cohen, 2020). This lack of viable solutions sets the stage for a wide array of research in the area of information disorder, including the experiment designed in response to the hypotheses proposed in this thesis proposal.

D. A MEME'S ROLE IN INFORMATION DISORDER CAMPAIGNS

Briefly discussed above and in Chapter I, memes tend to blend different topics together with the intent of invoking an emotional response from the viewer (Posetti & Bontcheva, 2020). Knowing that, many state and non-state actors have begun using memes to impart meaning on topics that fit their narrative, not the true narrative (U.S. Senate, 2019). Since the 2016 presidential election, Russia has continued to "infiltrate audiences on both the left and the right, and try to pit them against each other across race, socioeconomic status, religion, and any social issue" (Graff, 2018, para. 12). In 2019, this accusation was further supported on a national level by volume two of the Select Committee on Intelligence report from the U.S. Senate, which detailed Russia's social media use during said election. For example, Figure 4 shows an image propagated on social

Page 2494 of 3957

media by Russia in 2016 (Wyrich, 2017). These attacks are conducted by a corporation known as the Internet Research Agency (IRA), which is directed by Yevgeniy Viktorovich Prigozhin, a close ally of Vladimir Putin (Graff, 2018). Within the agency, Prigozhin funded an operation known as "Project Lakhta," whose purpose was to widen the political divide within the United States (Graff, 2018). Additionally, after failed attempts to influence American attitudes via Twitter, China "built a machinery of online controls that far exceed any other country's" (Meyers & Mozur, 2019, para. 14). In fact, evidence has concluded that China is now working similarly to Russia, "promoting negative messages about other states" in an attempt to divide groups (Weitz, 2020, para. 1). Even more concerning, the two nations have agreed to work together in future disinformation campaigns (Weitz, 2020). The success that Russia has seen in operations waged at free societies, specifically in the 2016 election, should raise concerns for all American citizens, especially if two peer threats are now corroborating (Calabresi, 2017; Weitz, 2020).

Although 2016 was previously considered the most meme-filled presidential election, according to *CNN* and *BBC* journalists, the 2020 one was even more fraught with them (Cillizza, 2020; Fabbri, 2020). Chris Cillizza, the editor for CNN's "Point" newsletter, discussed that, because former President Donald Trump was the most memed president in history, it set the stage for political campaigns run the same way (2020). Unsurprisingly, the American people like it this way; as a nation, we have become dependent on skimming for information, not actually reading, and memes allow us to gain info and move on quickly (Cillizza, 2020). According to Thomas Fabbri, a data analyst for *BBC News*, five main voices, running four overall accounts, were behind the memes of the 2020 election: Dan Bongino, Franklin Graham, James Woods, and Rafael and Omar Rivero (2020). Dan Bongino, who created and shared far-right conservative memes and commentary on his Facebook, was receiving more shares than *Fox News*, *CNN*, and *The New Work Times*, amassing to seven million in October of 2020 (Fabbri, 2020). Franklin Graham and James Woods, more conservative political election influencers, were also among the top meme generators and propagators, consistently spreading conspiracy theories about the left agenda. Finally, twins Rafael and Omar Rivero, who run the account "Occupy Democrats," were the main source of democratic memes during the election,

Page 2495 of 3957

gaining more shares than former President Trump's account on multiple occasions (Fabbri, 2020). While those five men all reside in the United States, many suspect that Russia, China, and Iran implanted their own meme driven narratives like the 2016 election (Corera, 2020). In fact, the United States government recently imposed sanctions on Russia for their state-sponsored roles in influencing the 2020 election (White House, 2021). While a full report, like that detailing the use of memes in the 2016 election will not be available for some time, it is likely that their involvement only went up after seeing previous success.

However, the use of memes in information disorder does not stop with political elections. In April 2020, the International Center for Journalists and the United Nations (UN-ICFJ) conducted a review of the disinformation being spread during the current COVID-19 pandemic (Posetti & Bontcheva, 2020). Their research revealed that, of the four main formats used for disinformation spread, memes accounted for two: emotive narrative constructs and memes, and "fraudulently altered, fabricated, or decontextualized images and videos" (Posetti & Bontcheva, 2020, sec. "The four main formats of COVID-19 disinformation"). The first format often mixes elements of truth with emotion, lies, and personal opinion, while the second format attempts to spread false stories, create confusion, and generate distrust (Posetti & Bontcheva, 2020). Although some memes have been used to propagate simple jokes or awareness of the deadliness of the virus, like Ghana's dancing pallbearers (BBC, 2020), others have been used with malicious intent; during the initial ages of COVID-19 spread, China began using memes and other techniques to convince European nations and Japan that U.S. service members spread the virus in their countries (Weitz, 2020). Additionally, the Chinese Communist Party offered to pay Twitter users with greater than 10,000 followers to share propaganda that discussed their superior handling of the pandemic (Kao & Li, 2020). The utilization of memes to spread disinformation about an ongoing pandemic solidifies the importance of studying what groups are more susceptible to this type of messaging.

E. TWITTER'S ROLE IN INFORMATION DISORDER

Dan Pfeiffer, a former White House communications director, states that "political campaigns are now modern information warfare—massive state-adjacent propaganda

Page 2496 of 3957

operations with Twitter bots that fuel outrage and drive media coverage" (Pfeiffer, 2020, para. 2). When attempting to spread a misleading narrative via Twitter, many organizations utilize software robots, or bots (Bessi & Ferrara, 2016). Bots, which have been used to influence politics since 2010, are somewhat difficult to identify with the untrained eye (Bess & Ferrara, 2016). However, using a public website and Python code, the machine learning framework known as BotOrNot identifies fake accounts with 95% accuracy (Bess & Ferrara, 2016). Utilizing BotOrNot and Twitter Search API, researchers Alessandro Bessi and Emilio Ferrara were able to show that, between the five weeks leading up to the 2016 presidential election, bots created 19% of all election-related Tweets, amassing to an astounding 3.8 million posts (2016). After identifying all the robot Tweets, Bessi and Ferrara applied SentiStrength, a sentiment analysis tool, to the bot posted Tweets and compared them to human-generated Tweets (2016). In doing so, Bessi and Ferrara showed that all Donald Trump related Tweets, human and bot, were positive in nature (2016). However, the Hilary Clinton Tweets published by bots were slightly less positive than those published by humans (2016). This difference in SentiStrength score highlights the importance of understanding who is running these bot accounts, which, in the following years, was found to be predominately Russian based offensive attacks aimed at influencing the presidential election (Timberg & Dwoskin, 2018).

While any user has the ability to post whatever he or she desires, a set of rules determine what remains online; in fact, between January 2019 and June 2020, Twitter suspended over 2.5 million accounts for things like terrorism, violent extremism, and child sexual exploitation (Twitter, 2021). While no Twitter suspensions are explicitly stated as contributing to misinformation, the website maintains guidelines and policies that restrict the spread of false information; for example, the COVID-19 misleading information policy explicitly states that "you may not use Twitter's services to share false or misleading information about COVID-19 which may lead to harm" (Twitter, 2021b, sec. "Overview"). However, after a scan of the Twittersphere (also known as Twitterverse), it is fraught with it.

III. RELATED WORK

It is important to understand where current research stands on memetics, Twitter, information disorder, and initial categorization to better grasp the experimental design detailed in the follow-on chapter. The sub-sections under each section denote the names of published articles, all of which were released in 2015 or later, and the body below summarizes the research conducted and its findings.

A. RESEARCH ON INFORMATION DISORDER WITH MEMES

The following sub-sections provide insight into information disorder research that focuses on the use of memetics on social media.

1. Political Memes and Fake News Discourses on Instagram

Ahmed Al-Rawi, an Assistant Professor of News, Social Media, and Public Communication at Simon Fraser University, devoted time to researching information disorder on Instagram by collecting 293,7773 posts with a search for "#fakenews" (2021). While the tools used to collect the posts pulled from 2012 to 2018, there appeared to be a central topic: politics (Al-Rawi, 2021). Through topic modeling and pivot tables, Ahmed Al-Rawi was able to determine that 69.2% of posts utilizing fake news discourse originated from Pro-Trump communities, with the next closest community being Anti-Trump at 13.9% of posts (Al-Rawi, 2021). Interestingly, most of the top 20 active users posting #fakenews images are self-proclaimed meme sites, like @conservative_americans and @Captain_Kekistan (Al-Rawi, 2021). With this information, we can hypothesize that Pro-Trump groups are aware of information disorder around them, but it is unclear if they are simply using the fake news hashtag for anything that goes against their belief system or truly believe the shared information is inaccurate.

2. Inferring Social Influence and Meme Interaction with Hawkes Processes

In 2015, researchers Chuan Luo, Xiaolong Zheng, and Daniel Zeng, who work at the Chinese Academy of Sciences State Key Laboratory of Management and Control for

Page 2499 of 3957

Complex Systems, noticed that no model existed to explain social influence and meme interaction (2015). Their study aimed to predict what effect influence had on users posting memes about the same or a similar topic; for example, if user X posts a meme about a democratic political candidate, user Y may be influenced to post the same meme or, perhaps, a republican one (Luo et al., 2015). Using a multidimensional Hawkes processes, which is a statistical method for explaining "that each arrival increases the rate of future arrivals for some period of time" (Laub et al., 2015, p. 1), Luo, Zheng, and Zeng, created a model that accurately displayed the user behavior related to 15 million Twitter posts centered on political events in Spain (2015). This successful model application allows follow-on researchers to estimate the propagation rate of memes regarding a specific topic, whether they are misinformation or true information.

3. The Evolution of Political Memes: Detecting and Characterizing Internet Memes with Multi-Modal Deep Learning

David Beskow, Sumeet Kumar, and Kathleen Carley, researchers at the School of Computer Science Carnegie Mellon University, hypothesized that, as memes propagate, they transform, eventually reaching greater depths of the internet than traditional images (2020). Through the utilization of various deep learning methods, the researchers were able to classify 5,000 meme and 5,000 non-meme images related to the 2018 U.S. midterm elections into various groups of content, or families (Beskow et al., 2020). Using Google Vision API to conduct a reverse image lookup, Beskow, Kumar, and Carley found that the meme images returned 62,475 matching links, while the non-meme images only returned 9,536. Crunching those numbers, the researchers found that memes were four times more likely to return search results, demonstrating that memes propagate to wider areas of the internet than images alone (Beskow et al., 2020).

B. RESEARCH ON INFORMATION DISORDER USING TWITTER

The following sub-sections provide insight into information disorder research that uses Twitter as a propagation platform.

Page 2500 of 3957

1. Coronavirus Goes Viral: Quantifying the COVID-19 Misinformation Epidemic on Twitter

In 2020, 10 medical faculty at the American University of Beirut ran an experiment that reviewed Tweets based solely on COVID-19 (Kouzy et al., 2020). In a single day, the researchers collected 673 Tweets that corresponded to 14 trending hashtags (Kouzy et al., 2020). Upon review of all Tweets, Kouzy et al. found that, while 81.4% of Tweets had true information, 24.8% included misinformation, meaning some Tweets contained both (2020). Interestingly, 33.8% of personal/group Twitter accounts contained misinformation, while only 18.6% of news outlets/journalist Tweets reviewed contained misinformation (Kouzy et al., 2020). Finally, the researchers did not find any correlation between the number of likes or retweets and the occurrence of misinformation (Kouzy et al., 2020).

2. The Spread of True and False News Online

Rather than focus on the spread of false information centered on one topic, researchers Soroush Vosoughi, Deb Roy, and Sinan Aral from the Massachusetts Institute of Technology (MIT) looked at how true and false information propagate as a whole (2018). The MIT researchers pulled approximately 126,000 true and false news focused Tweets from 2006 to 2017 that had cascaded via retweets and comments more than 4.5 million times (Vosoughi et al., 2018). From there, Vosoughi et al. was able to quantify depth, size, breadth, and structural virality of the cascades (2018). Interestingly, the researchers found that "falsehood diffused significantly farther, faster, deeper, and more broadly than the truth in all categories of information" (Vosoughi et al., 2018, sec. "Abstract"). In fact, the model used by the researchers showed that false Tweets are retweeted 70% more often than true ones (Vosoughi et al., 2018). Additionally, Vosoughi et al. analyzed false Tweets to speculate on why they were being retweeted at greater rates, which led them to determine that they contained more novelty than true Tweets (2018). The authors noted that novelty was only speculation and more research was needed to determine the true reason false Tweets are spread at greater rates (Vosoughi et al., 2018); the experiment designed in this thesis aims to draw some conclusions between that gap in literature.

C. INFLUENCE EFFECTIVENESS OF INFORMATION DISORDER

The following sub-sections provide insight into the effectiveness of information disorder and propaganda. Currently, the research involving information disorder influence effectiveness on social media is limited, so the topics summarized below span an array of delivery methods. Propaganda, which uses both true (like malinformation mentioned in the previous chapter) and false information to push a specific narrative, is a common term used when reading about information disorder (Wardle & Derakhshan, 2017). Propaganda and information disorder, however, vary slightly in that propaganda emphasizes emotional response at greater depths than information disorder (Wardle & Derakhshan, 2017). However, both are influence operations, making propaganda effectiveness an important aspect of this thesis.

1. Does Russian Propaganda Work?

Beginning in the mid-2000s and increasing when Vladimir Putin regained office in 2012, Russia has been utilizing propaganda to influence its citizens and those abroad (Gerber & Zavisca, 2016). The propaganda, which begins as official government statements and propagates through mass media and social media, seeks to legitimize current government efforts and project power internationally (Gerber & Zavisca, 2016). Understanding the political influence state-run propaganda can have, researchers Theodore Gerber, a sociology professor at the University of Wisconsin-Madison, and Jane Zavisca, the associate dean for Research, College of Social & Behavioral Sciences at the University of Arizona, sought to determine how effective the Russian propaganda had been on its audiences (2016). To answer their research questions, Gerber and Zavisca surveyed citizens in Russia, Ukraine, Azerbaijan, and Kyrgyzstan (2016). Upon review and analysis, they found that the Russian propaganda was effective within the borders of their country, but not nearly as effective outside of it (Gerber & Zavisca, 2016). From their research, Gerber and Zavisca found that 85% of Russians surveyed viewed the United States as an enemy or rival, while only 8% of Ukrainians felt the same way (2016). Azerbaijan, which totaled 24% for enemy or rival, was nearly even with Kyrgyzstan, who totaled to 23% (Gerber & Zavisca, 2016). In their conclusion, Gerber and Zavisca note that there is not a

Page 2502 of 3957

great solution to counter the propaganda that has been effective in neighboring Russian countries because the media is greatly controlled by Russia (2016).

2. Understanding What Makes Terrorist Groups' Propaganda Effective: An Integrative Complexity Analysis of ISIL and Al Qaeda

According to Michael Leiter, the former director of the U.S. Counterterrorism Center, ISIL maintains a constant presence on social media, pushing out propaganda nearly 24 hours a day (Houch et al., 2017). In 2015, it was estimated that, along with other media utilization, ISIL consistently gained 1,000 members monthly (Houch et al., 2017). Through an analysis of the integrative complexity seen in ISIL propaganda, researcher Shannon Houck from Syracuse and researchers Meredith Repke and Lucian Conway III from the University of Montana evaluated what makes ISIL propaganda more effective than Al Qaeda (2017). Houck et al. determined that ISIL used increasingly more simplistic messaging than Al Qaeda, hypothesizing that either ISIL realizes complexity of messaging fails to reach target audiences or they just happen to be sending out simpler propaganda (2017). The research completed by this team backs up previous research that showed "when a group is seeking to gain power, less complexity is more effective for garnering power and achieving political success" (Houck et al., 2017, sec. "Why might Al Qaeda and ISIL differ?").

D. CATEGORIZATION AND DECISION MAKING

When an individual reaches a decision point, like a judge determining if a defendant is guilty, they must assign a category (Wang & Busemeyer, 2016). This categorization, like the judge determining that he/she is, in fact, guilty, leads to follow-on action, like assigning punishment (Wang & Busemeyer, 2016). In the cognitive sciences field, researchers hypothesize that, if an individual is required to announce their categorization prior to action, they may make a different choice than had they acted without reporting first (Wang & Busemeyer, 2016). For example, if a police officer categorizes an individual as having a weapon, then reports that the suspect has a weapon prior to acting, rather than shooting immediately, the outcome may be different (Wang & Busemeyer, 2016). Knowing that, the experimental design detailed in Chapter Four incorporates initial categorization,

Page 2503 of 3957

attempting to address whether said categorization truly affects the way an individual interacts with information. Below, recent works in the field of categorization and decision making are summarized, allowing the reader to gain an understanding that will translate when viewing the follow-on chapter.

1. Interference Effects of Categorization on Decision Making

Researchers Zheng Wang of The Ohio State University and Jerome Busemeyer of Indiana University utilized multiple models, including the Markov model, Signal detection model, and Quantum model, to study category-decision linked tasks (2016). During three slightly varied experiments, the researchers presented participants with images of faces where some had been categorized (through a label) as displaying a good guy (g) or bad guy (b), some were required to be categorized by the participant, and some lacked categorization completely (Wang & Busemeyer, 2016). Once viewing the face, and categorizing as necessary, participants would decide whether to attack the individual or withdraw (Wang & Busemeyer, 2016). After reviewing the results and applying the three models listed previously, Wang and Busemeyer were able to identify inference effects (statistical conclusions about the data) that occurred between trials with categorization and without categorization (2016). The occurrence of these inference effects, which existed in some predicted and some unpredicted places, highlights the ability for categorization to change the way an individual views something, as well as their follow-on decision (Wang & Busemeyer, 2016).

2. An Evidential Dynamical Model to Predict the Interference Effect of Categorization on Decision Making Results

While the above experiment utilized the Quantum, Markov, and Signal Detection models to find inference effects, researchers Zichang He and Wen Jiang of Northwestern Polytechnical University created a new evidential dynamic model (2018). Through the integration of Dempster-Shafer evidence theory and quantum dynamical modelling, He and Jiang's model successfully illustrated category-decision task inference effects without the need for integrating multiple experiments and models together (2018). To be successful, He and Jiang created the model to measure the handling of uncertain states in

Page 2504 of 3957

action, which is different than the aforementioned, which measures an "entanglement of beliefs and actions" (2018, p. 140). By creating a new model that provides the same effectiveness and efficiency of previous models, He and Jiang were able to show once again that categorization influences follow-on decision making (2018).

Page 2505 of 3957

THIS PAGE INTENTIONALLY LEFT BLANK

Page 2506 of 3957

IV. METHODOLOGY

The experiment designed in this chapter aims to answer the hypotheses presented in Section A by creating a survey that can, if released for public participation, highlight possible correlations between the acceptance and propagation of false information and age, education, and gender, as well as the effect of initial categorization on decision making. In Section A, the hypotheses from Chapter I are presented again. In Section B, an overview of the experiment is detailed, which includes information on the participants and setting (online delivery). In Section C, the Tweets and memes used in the experiment are presented. Section D contains a detailed description (with figures) of how the experiment was built in Qualtrics. Finally, Section E discusses limitations of the experiment designed.

A. HYPOTHESES

The experiment designed in this chapter aims to answer the following hypotheses:

- HA1: Age correlates to the acceptance of false information spread through a Tweet and an image macro meme.
- HA2: Education level correlates to the acceptance of false information spread through a Tweet and an image macro meme.
- HA3: Gender correlates to the acceptance of false information spread through a Tweet and an image macro meme.
- HA4: Age correlates to the propagation of false information spread through a Tweet and an image macro meme.
- HA5: Education level correlates to the propagation of false information spread through a Tweet and an image macro meme.
- HA6: Gender correlates to the propagation of false information spread through a Tweet and an image macro meme.

Page 2507 of 3957

- HA7: Initial categorization has an effect on the acceptance of false information spread through Tweets and image macro memes.
- HA8: Memes will be interacted with (by indication of liking, commenting, or sharing) at a different rate than Tweets.

B. EXPERIMENTAL DESIGN OVERVIEW

If individuals were to take the experiment as it is designed currently, the participants first view instructions for the experiment, then provide consent to participate, and finally give their age, gender, and education. Age is broken down into the following groups: 18–25, 26–33, 34–41, 42–49, 50–57. Gender is disclosed as preferred sex (not assigned), containing options for male or female. Education is broken down by the following selections: high school diploma, associate's degree, undergraduate level schooling in progress, bachelor's degree, graduate-level schooling in progress, master's degree, doctorate-level schooling in progress, and doctorate degree. Please see Table 1 for an overview of the variables collected.

Table 1. Variables collected during the experiment

Factors	Levels
Age	5 levels
Education	8 levels
Gender	2 levels
Meme (With and Without) Tweet	2 levels
Categorization (With and Without) Tweet	2 levels

Following those selections, participants will begin the experiment. Each participant will randomly start with one of the following four groups and proceed on the path outlined in Figure 6: seven simulated Tweets with initial categorization questions (set one), seven simulated Tweets without initial categorization questions (set two), seven image macro memes with initial categorization questions (set one), or seven image macro memes without initial categorization questions (set two). All Tweets and image macro memes contain inaccurate information centered on COVID-19 and can be viewed later in this

Page 2508 of 3957

chapter. Set one and Set two denote the line of questioning that appears with the Tweet or image macro meme and can be viewed below the experimental flow chart.

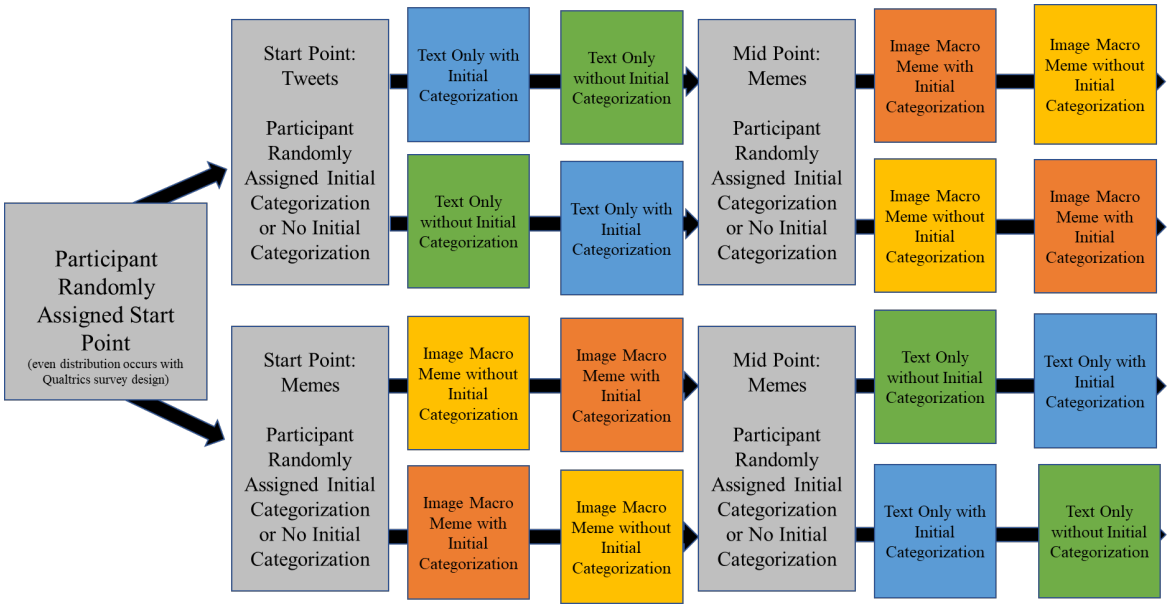

Figure 6. Experiment flow chart

When designing the questions, it was important to offer participants a selection for any reason they may interact with the Tweet or meme. Because memes are generally viewed as humorous, that was included in the top spot. A selection of "A" or "C" (Affiliated with my personal views) in question set one or two will help guide research analysis; interacting with a Tweet or meme because it is humorous or affiliated with person views will help propagate but does not indicate susceptibility to information disorder. However, because the experiment is built to measure susceptibility between different independent variables, participants may select "Accurate information" or a combination of "Accurate information" with "Humorous" or "Affiliated with my personal view." If that is selected, it will assist researchers in finding correlations between susceptibility and the independent variables. Below, the question sets are presented. Set one includes initial categorization, while set two does not.

Page 2509 of 3957

Set One of questioning:

1. Would you interact with this Meme/Tweet on social media (Facebook, Instagram, Twitter, etc.) by liking, commenting, or sharing the post?
    a. Yes
    b. No
2. If YES, why would you interact with this Meme/Tweet on social media?
    a. Humorous
    b. Accurate information
    c. Affiliated with my personal views
    d. Humorous and Accurate Information
    e. Humorous and Affiliated with my personal view
    f. Accurate information and Affiliated with my personal views
    g. Disagree with information
3. If NO, why wouldn't you interact with this Meme/Tweet on social media?
    a. Not active on social media
    b. Inaccurate information
    c. Goes against my personal views
    d. Not active on social media and Inaccurate information
    e. Not active on social media and Goes against my personal views
    f. Inaccurate information and Goes against my personal views
    g. Disagree with information

Set Two of questioning:

1. Why would you interact with this Meme/Tweet on social media (Facebook, Instagram, Twitter, etc.) by liking, commenting, or sharing the post?
    a. Humorous
    b. Accurate information
    c. Affiliated with my personal views
    d. Humorous and Accurate Information
    e. Humorous and Affiliated with my personal view
    f. Accurate information and Affiliated with my personal views
    g. Disagree with information
    h. I would not interact with this on social media

After each participant has completed all four sections, they are shown a disclaimer that tells them that all the information seen in the experiment was manipulated into false information. This will prevent any participant from falling victim to misinformation as a result of this research. The way in which the information was manipulated is described below each tween and meme presented in the next section.

Page 2510 of 3957

C. TWEETS AND MEMES USED

Below, every Tweet and image macro meme used in the experimental design is presented. Underneath each figure, the reasoning for the particular Tweet or meme is detailed. First, all 14 Tweets will be presented. Following that, all 14 memes will be presented.

1. Tweets Used in the Experimental Design

To create the 14 Tweets used in this experiment, many things were taken under consideration. First and foremost, the creation source was selected: www.tweetgen.com. This site allows the user to adjust the theme, add a profile picture, create a name, insert a Twitter handle, make the account verified, add Tweet content, insert an image, and adjust the time, date, retweets, and likes. Next, it was important to select a widely recognizable news sources' Twitter profile and mimic it exactly. Had a lesser-known source been selected, it was feared that participants would not trust the source, and, in turn, that would skew their answers to the experiment questions.

Having 48.7 million followers on Twitter, *The New York Times* was deemed a good model and all Tweets were created to match its profile. As seen in Figure 7, the image, name, and Twitter handle is the same as the real version. Additionally, the account appears verified, just like it is online. Finally, if the Tweet was modeled directly after a real *The New York Times* Tweet, the retweets and likes were also modeled directly after the original Tweets retweets and likes at the time of creation. However, if the Tweet was modeled after a different source, the retweets and likes were randomly generated on the www.tweetgen.com site.

Below, all 14 Tweets used are presented. Beneath each Tweet, the reasoning for the Tweet content is briefly explained.

Page 2511 of 3957

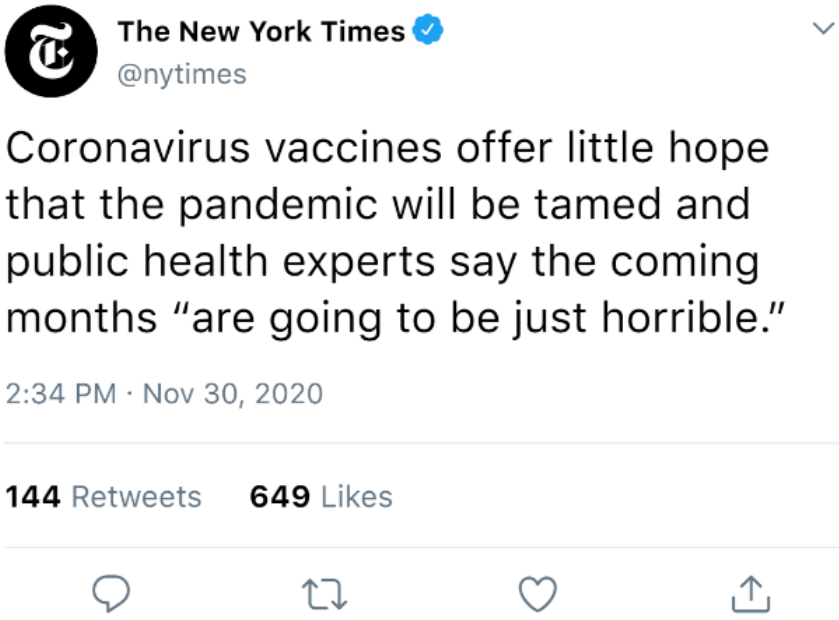

Figure 7. Tweet number one. Adapted from *The New York Times* (2021).

Tweet number one was modeled directly after a Tweet posted by *The New York Times* on November 30, 2020, that stated: "Good news about coronavirus vaccines offers hope that the pandemic will be tamed. But public health experts say the coming months "are going to be just horrible." In an attempt to make it misinformation, the Tweet was altered to remove the beginning words and now contains the word "little" before "hope." As a result, the fake Tweet does not make the COVID-19 vaccine look like a solution to the pandemic and creates a sense of doom.

Page 2512 of 3957

Figure 8. Tweet number two. Adapted from *The New York Times* (2021).

Tweet number two was created in response to real conspiracy theories that claim hospitals are inflating numbers of COVID-19 related deaths in an attempt to benefit financially (Knight & Appleby, 2020).

Figure 9. Tweet number three. Adapted from *The New York Times* (2021).

Tweet number three was modeled directly after a Tweet posted by *The New York Times* on February 16, 2021, that stated: "North Korea has tried to steal Covid-19 vaccine and treatment technology by attempting to hack international pharmaceutical companies, including Pfizer, a South Korean lawmaker said on Tuesday after a briefing by intelligence officials." The date, reTweets, quote Tweets, and likes were taken directly from the original Tweet (on February 16, 2021). To make this misinformation, the country of North Korea was replaced with Russia, and the identifier of "South Korean lawmaker" was removed. As a result, the Tweet presents Russia as the intelligence threat, not North Korea.

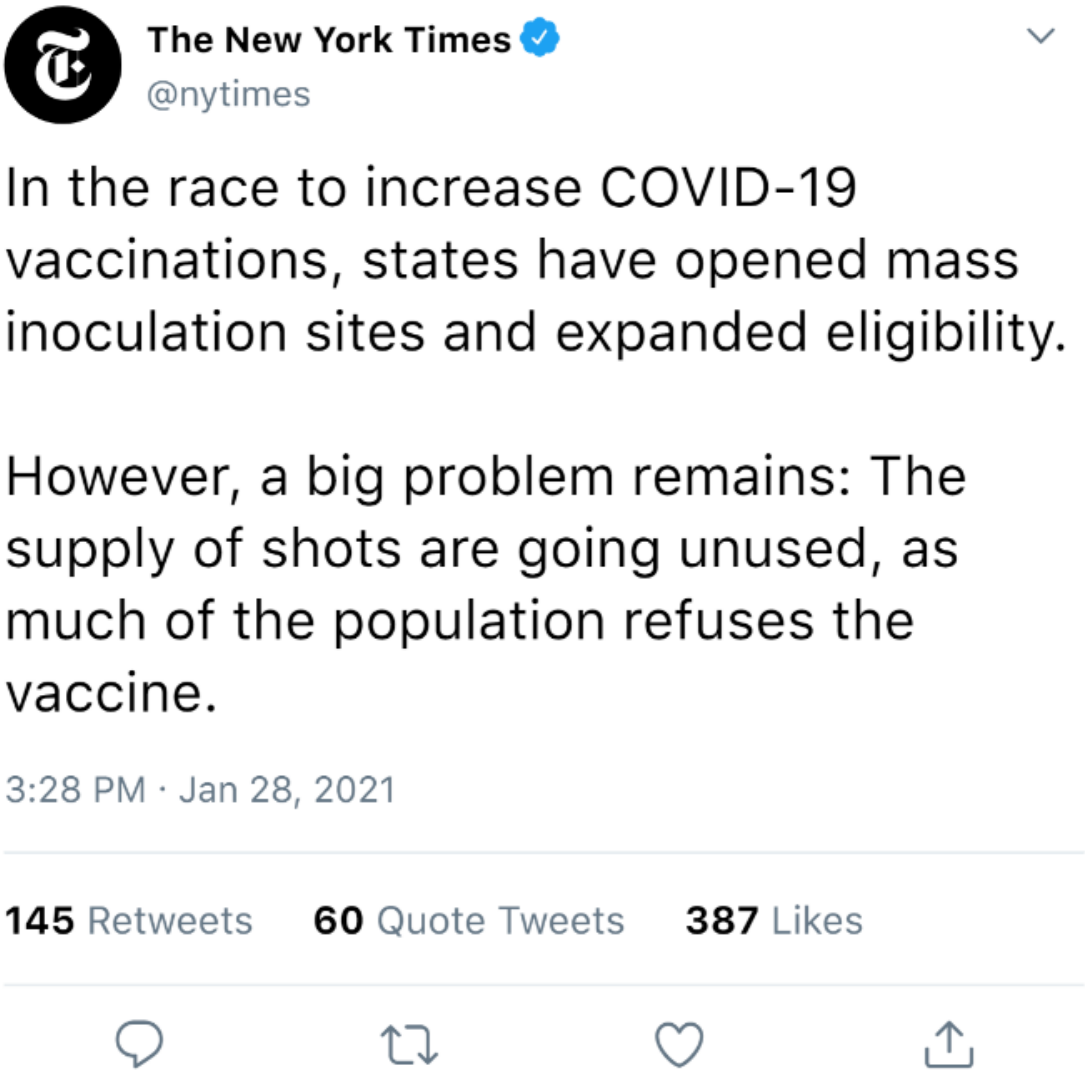

Figure 10. Tweet number four. Adapted from *The New York Times* (2021).

Tweet number four was modeled directly after a Tweet posted by *The New York Times* on February 15, 2021, that stated: "In the race to increase Covid-19 vaccinations, states have opened mass inoculation sites and expanded eligibility. But a big problem remains: The supply of shots isn't increasing fast enough." The reTweets, quote Tweets, and likes were taken directly from the original Tweet (on February 16, 2021). To make this misinformation, the big problem was changed to a lack of participants instead of vaccine supply.

Page 2515 of 3957

Figure 11. Tweet number five. Adapted from *The New York Times* (2021).

Tweet number five was modeled directly after a Tweet posted by *The New York Times* on February 14, 2021, that stated: "A team of experts selected by the WHO to investigate the origins of the coronavirus returned last week from Wuhan. They plan to produce a joint report on the virus, which they agree most likely originated from an animal – and not a lab." The date, reTweets, quote Tweets, and likes were taken directly from the original Tweet (on February 16, 2021). In the manufactured Tweet, the virus was said to be manufactured in a lab (vice naturally occurring in an animal), appealing to individuals that believe COVID-19 was created as a bioweapon.

Page 2516 of 3957

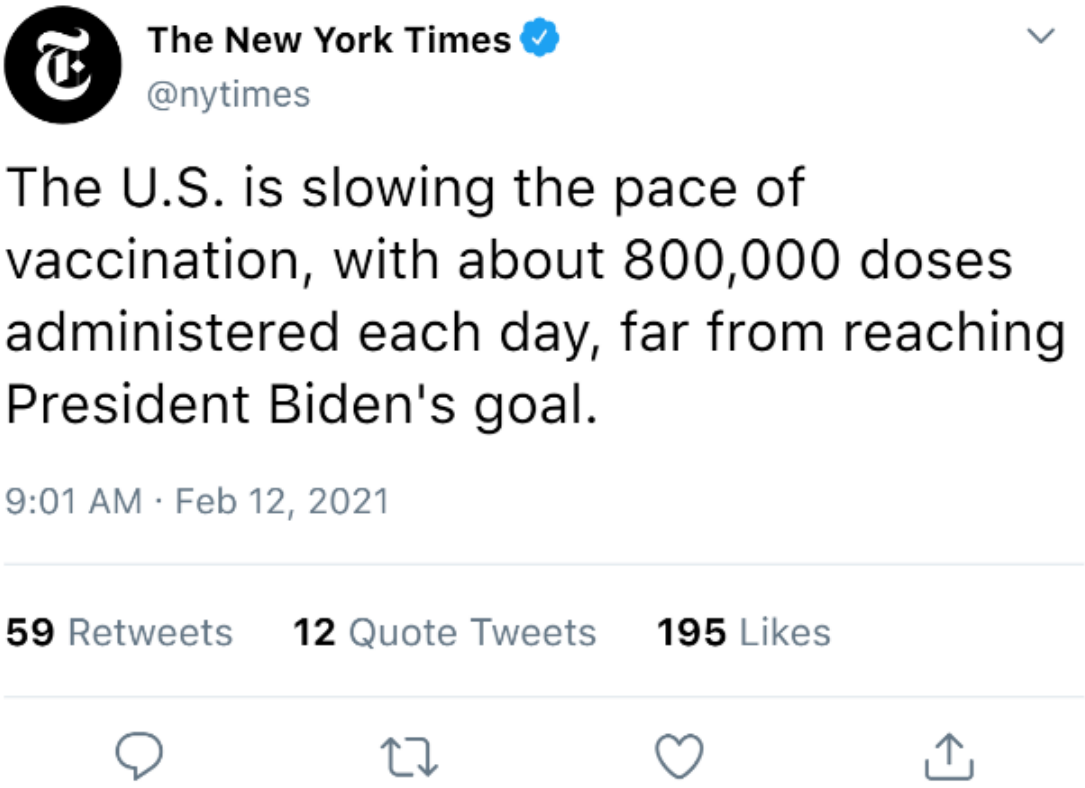

Figure 12. Tweet number six. Adapted from *The New York Times* (2021).

Tweet number six was modeled directly after a Tweet posted by *The New York Times* on February 12, 2021, that stated: "The U.S. is also picking up the pace of vaccination, with about 1.6 million doses administered each day, exceeding President Biden's goal." The date, reTweets, quote Tweets, and likes were taken directly from the original Tweet (on February 16, 2021). The number of vaccinations occurring daily, as well as the perceived pace (slowing vice picking up) was altered to make it appear like President Biden is not reaching his goal for the nation.

Page 2517 of 3957

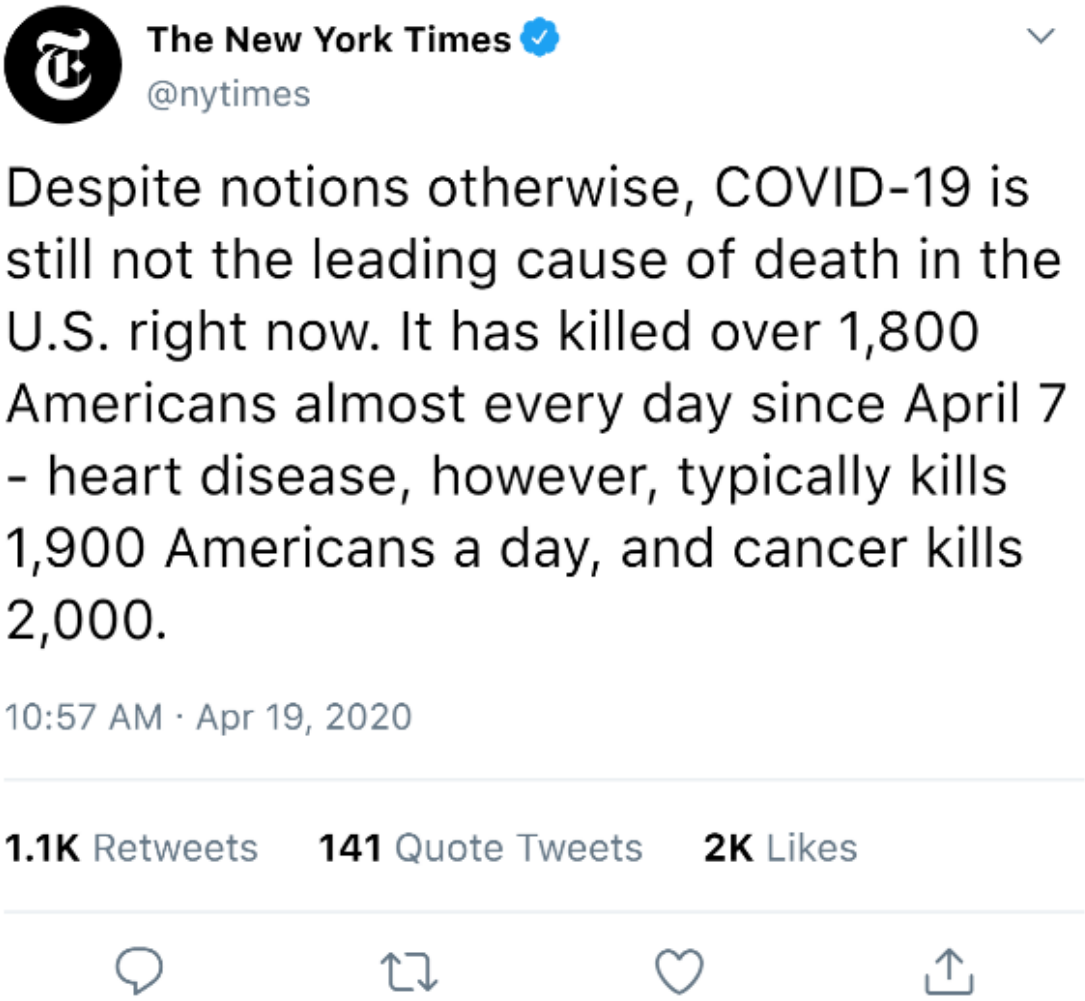

Figure 13. Tweet number seven. Adapted from *The New York Times* (2021).

Tweet number seven was modeled directly after a Tweet posted by *The New York Times* on April 19, 2020, that stated: "COVID-19 is arguably the leading cause of death in the U.S. right now. It has killed over 1,800 Americans almost every day since April 7 – heart disease typically kills 1,774 Americans a day, and cancer kills 1,641." The date, reTweets, quote Tweets, and likes were taken directly from the original Tweet (on February 16, 2021). This manufactured Tweet was altered to make heart disease and cancer a bigger threat than COVID-19.

Figure 14. Tweet number eight. Adapted from *The New York Times* (2021).

Tweet number eight was modeled directly after a Tweet posted by *The New York Times* on January 9, 2020, that stated: "There's no evidence that the virus, a coronavirus, is readily spread by humans, and it has not been tied to any deaths. But health officials in China and internationally are watching it carefully." The date, reTweets, quote Tweets, and likes were taken directly from the original Tweet (on February 16, 2021). The alteration of the original Tweet creates a narrative that world leaders knew the early dangers of COVID-19 and chose to ignore them.

Figure 15. Tweet number nine. Adapted from *The New York Times* (2021).

Tweet number nine was modeled directly after a Tweet posted by *The New York Times* on May 10, 2020, that stated: "What's clear: A one-time social distancing effort won't be sufficient to control the coronavirus, and it will take a long time to reach herd immunity. Without an effective vaccine, our pandemic state of mind may persist well into 2021 or 2022." The date, reTweets, quote Tweets, and likes were taken directly from the original Tweet (on February 16, 2021). Changing the Tweet to state that one-time social distancing will, in fact, be enough to combat the pandemic, transforms the original message to misinformation.

Figure 16. Tweet number ten. Adapted from *The New York Times* (2021).

Tweet number ten was modeled directly after a Tweet posted by *The New York Times* on December 19, 2020, that stated: "Early in the coronavirus outbreak, Chinese authorities clamped down on information to make the virus look less severe, and the government more capable, thousands of secret government directives and other documents reviewed by @nytimes and @propublica show." The date, reTweets, quote Tweets, and likes were taken directly from the original Tweet (on February 16, 2021). By replacing "Chinese" with "U.S." authorities, we create mistrust towards our government, which is rooted in misinformation.

Figure 17. Tweet number eleven. Adapted from *The New York Times* (2021).

Tweet number eleven was modeled directly after a Tweet posted by *The New York Times* on December 8, 2020, that stated: "The coronavirus vaccines will probably prevent you from getting sick with Covid-19. But it's not yet clear whether you can still get infected asymptomatically and silently spread the virus." The date, reTweets, quote Tweets, and likes were taken directly from the original Tweet (on February 16, 2021). Slightly changing the Tweet to state that the vaccine will not prevent you from catching the virus, vice maintaining an unsure position, turns this into subtle misinformation.

Page 2522 of 3957

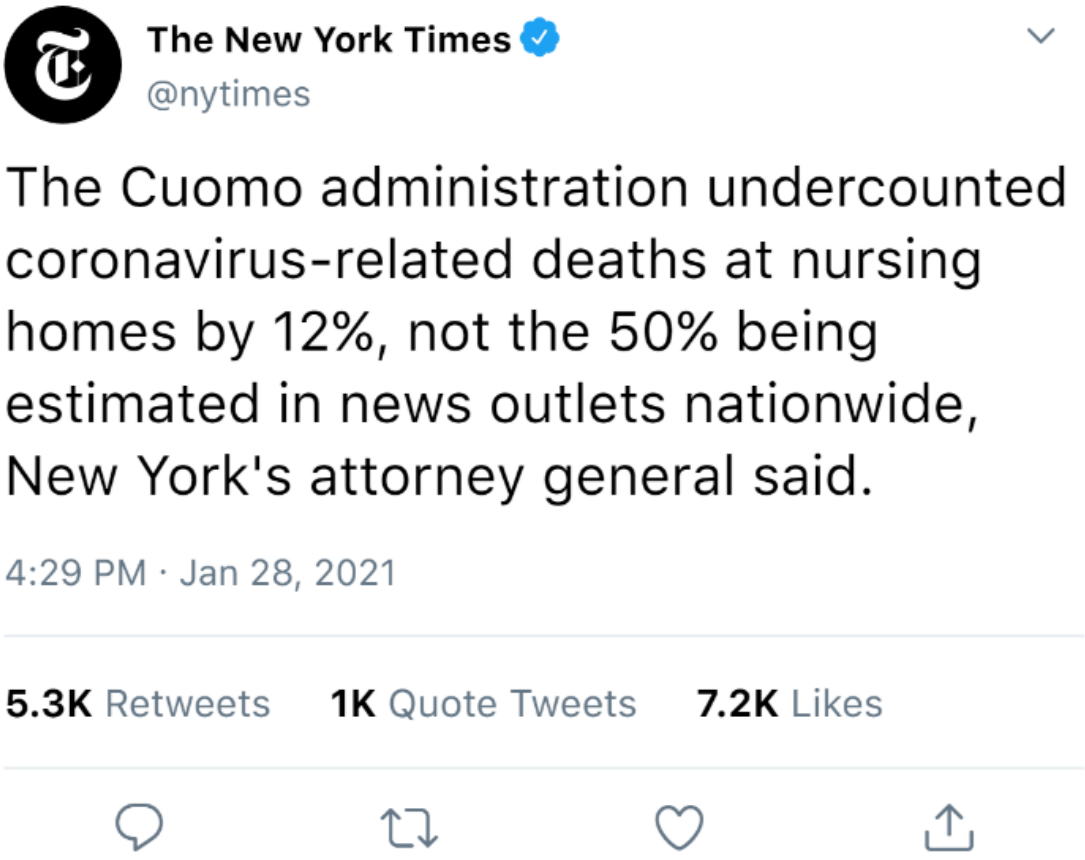

Figure 18. Tweet number twelve. Adapted from *The New York Times* (2021).

Tweet number twelve was modeled directly after a Tweet posted by *The New York Times* on January 28, 2021, that stated: "The Cuomo administration undercounted coronavirus-related deaths at nursing homes by as much as 50%, New York's attorney general said." The date, reTweets, quote Tweets, and likes were taken directly from the original Tweet (on February 16, 2021). This misinformation alteration attempts to delegitimize the accusations that New York Governor Cuomo greatly underreported COVID-19 deaths in nursing homes, while the truth is quite the opposite.

Figure 19. Tweet number thirteen. Adapted from The *New York Times* (2021).

Tweet number thirteen was modeled directly after a Tweet posted by *The New York Times* on February 16, 2021, that stated: "The pandemic has taken over most children's lives – shutting down in-person school, sports and socializing. That has prompted some teenagers, who otherwise feel powerless, to fight back by volunteering for vaccine trials." The date was taken directly from the original Tweet, while the reTweets, quote Tweets, and likes were randomized by the Tweet generation website. The manipulation of this Tweet creates misinformation by framing teenagers as rude and vindictive.

Page 2524 of 3957

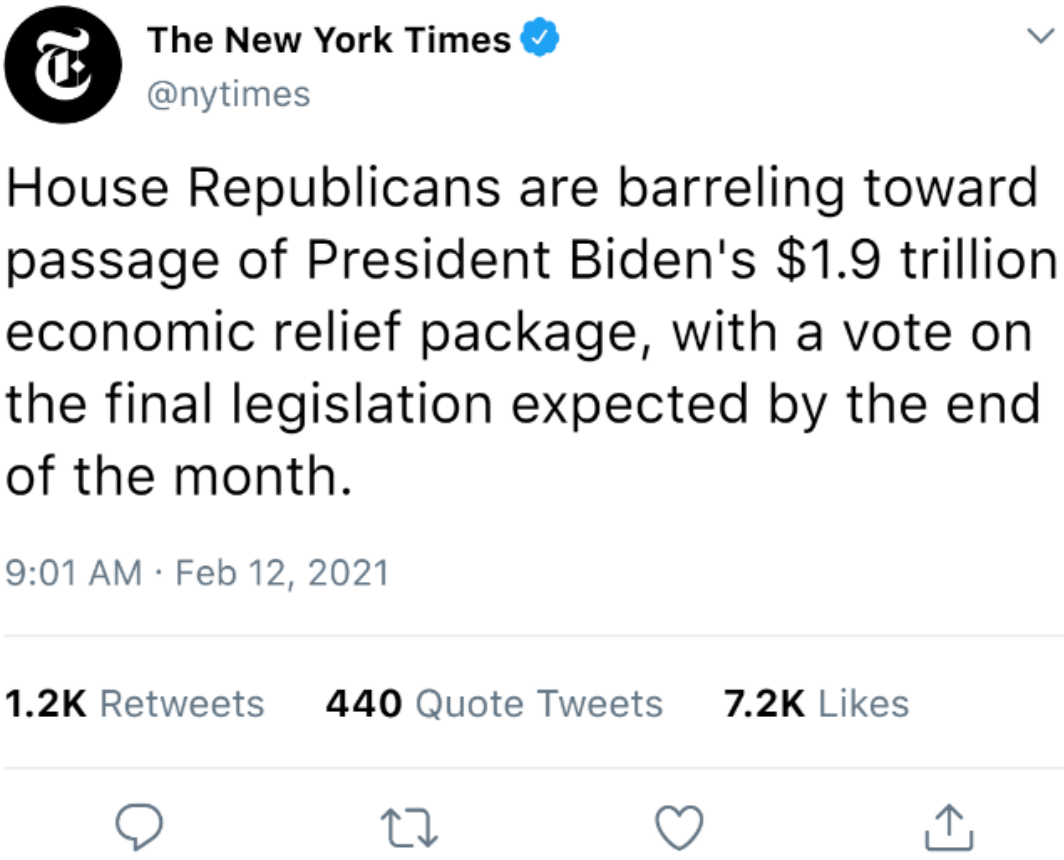

Figure 20. Tweet number fourteen. Adapted from *The New York Times* (2021).

Tweet number fourteen was modeled directly after a Tweet posted by *The New York Times* on February 16, 2021, that stated: "House Democrats are barreling toward passage of President Biden's $1.9 trillion economic relief package, with a vote on the final legislation expected by the end of the month." The date, reTweets, quote Tweets, and likes were randomized on the Tweet generation website. Changing "Democrats" to "Republicans" paints the picture that there is bipartisan support, making the overall message into misinformation.

2. Memetics Used in Experimental Design

The image macro memes used in this experiment were created by the author on the website https://www.imgflip.com/memegenerator. All images used were selected from the

"Expanding Brain" on the imgflip site, specifically under the "Popular" tab. A link to the meaning of each image selected is provided in the description of each meme created. The various content of the memes were inspired by conspiracy theories and popular misinformation campaigns that have been widespread throughout the current pandemic.

Figure 21. Meme number one. Adapted from Bremmer (2020).

Meme number one was inspired by a *Time* article entitled "The Best Global Responses to COVID-19 Pandemic" (Bremmer, 2020). The article protests that, as of June 2020, the epicenter of the pandemic was in the United States (Bremmer, 2020). Following that, it lists other nations that did a better job than the United States at controlling the spread of the virus (Bremmer, 2020). By suggesting that every other nation, not just some nations, have slowed the spread better than the U.S., this misinformation memetic spreads distrust in the U.S. Government handling of the pandemic itself. To learn more about the image behind this meme, visit https://knowyourmeme.com/memes/but-thats-none-of-my-business.

Page 2526 of 3957

Figure 22. Meme number two. Adapted from Lynas (2020).

Meme number two was inspired by a widespread conspiracy theory that 5G is spreading COVID-19 via the electromagnetic spectrum (Lynas, 2020). According to believers, the rollout of 5G and the rapid takeover of coronavirus were identically timed, allowing them to link the two events together (Lynas, 2020). To learn more about the image behind this meme, visit https://knowyourmeme.com/memes/i-bet-hes-thinking-about-other-women.

Figure 23. Meme number three. Adapted from Lynas (2020).

Meme number three was inspired by the conspiracy theory that big pharmaceutical companies are hyping up COVID-19 to appear worse than it is in order to sell more products (Lynas, 2020). For example, Joseph Mercola, an anti-vax medical professional, was banned from Google for pushing his products through claims that they cure and prevent COVID-19 (Lynas, 2020). According to Lynas at Cornell Alliance for Science, "big pharma conspiracies are a staple of anti-vaccination narratives, so it is hardly surprising that they have transmuted into the age of coronavirus" (2020, sec. "COVID is a plot by Big Pharma). To learn more about the image behind this meme, visit https://knowyourmeme.com/memes/disaster-girl.

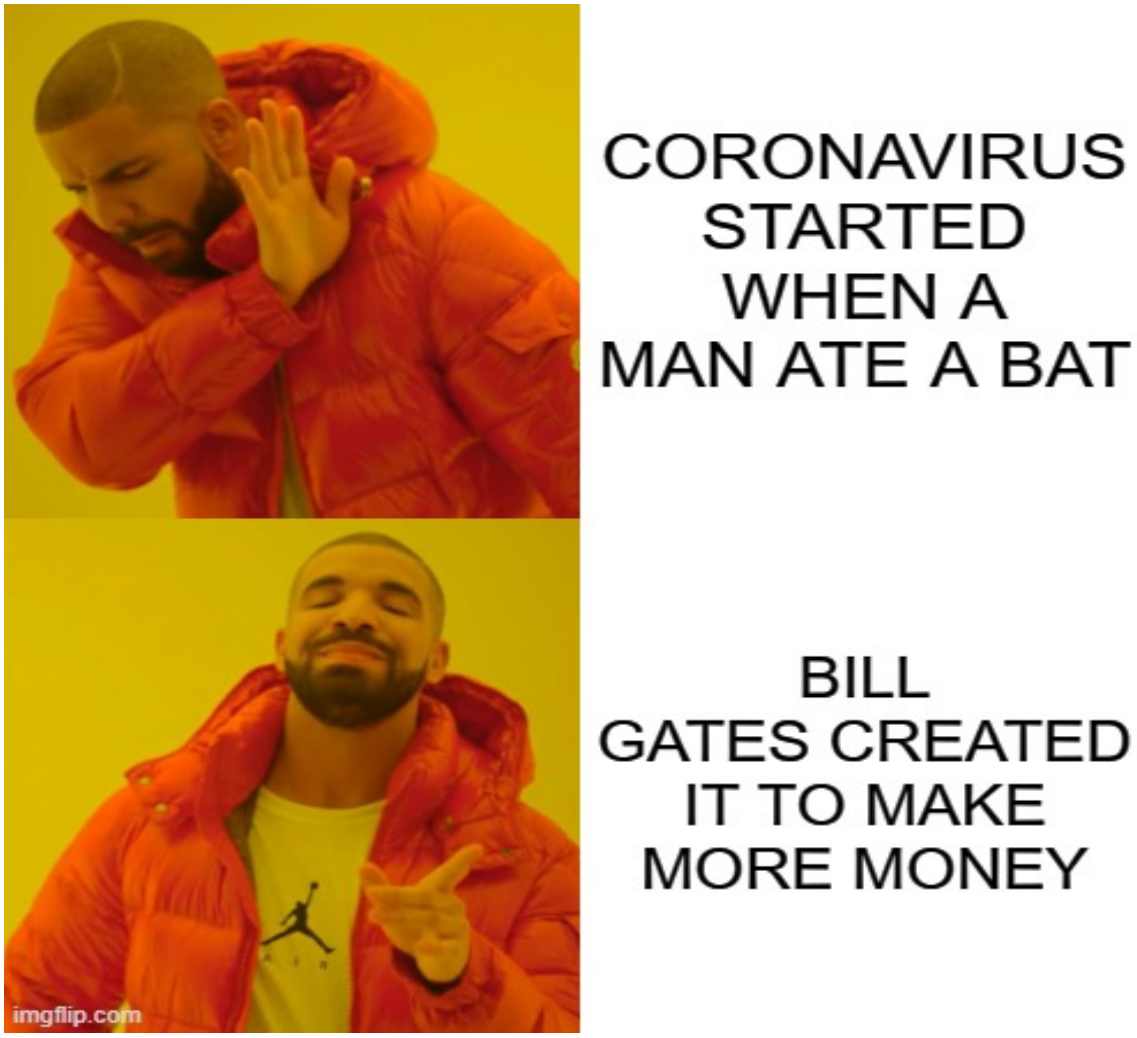

Figure 24. Meme number four. Adapted from Lynas (2020).

Meme number four was inspired by the theory that Bill Gates knew about an impending pandemic and, either created the virus, or invested in vaccination technology to profit off of it (Lynas, 2020). According to QAnon and far-right political members, previous Bill Gates Ted talks allude to his knowledge of an impending global pandemic (Lynas, 2020). Some protestors to this conspiracy theory believe it is the result of Gates criticizing former President Trumps move to defund the World Health Organization (Lynas, 2020). To learn more about the image behind this meme, visit https://knowyourmeme.com/memes/drakeposting.

Figure 25. Meme number five. Adapted from Lewis (2020).

Meme number five was inspired by a conspiracy theory that believes COVID-19 was released from a Chinese lab as a bioweapon (Lewis, 2020). Although the true origin is said to be naturally occurring in Wuhan, China, former President Trump and many supporters claim it started in Chinese virologist Shi Zhengli's lab (Lewis, 2020). To learn more about the image behind this meme, visit https://knowyourmeme.com/memes/distracted-boyfriend.

Figure 26. Meme number six. Adapted from Pinsker (2021), Beals (2020), Bazelon (2020), & Clarke (2020).

Meme number six was inspired by the continued question that has plagued American minds since March 2020: When will life be normal again? (Pinsker, 2021). Initially, citizens were told that COVID-19 would likely diminish in the summer of 2020 (Beals, 2020). Following the realization that that was not the case, Americans in many states were in disarray over the continuous closure of the economy, wondering when that would reopen (Bazelon, 2020). As much of the world transitioned to 2021 still in state-wide lockdowns, hopeful citizens pushed their winter travel to 2021 (Clarke, 2020). The final section of the meme, stating "the government is handling this well," is simply a way to make it appear controversial. To learn more about the image behind this meme, visit https://knowyourmeme.com/memes/putting-on-clown-makeup.

Figure 27. Meme number seven. Adapted from Lee (2020), & Naishadham et al. (2020).

Meme number seven was inspired by the idea that selfishness has led to many infections and untimely COVID-19 related deaths. Currently, there are a number of opinion pieces found online that link selfishness to the deaths of loved ones. For example, on *The Colorado Sun* website, you can find an article entitled, "Selfishness during a pandemic may have killed my father. It shouldn't have ended this way" (Lee, 2020). Additionally, on the *Chicago Tribune* website, you will see an article titled, "Too many people are selfish: As

Americans resist COVID-19 restrictions, U.S. nears 5 million infections" (Naishadham et al., 2020). To learn more about the image behind this meme, visit https://knowyourmeme.com/memes/daily-struggle.

Figure 28. Meme number eight. Adapted from Pitofsky (2021).

Meme number eight was inspired by the large number of the U.S. population that claims they will not get the COVID-19 vaccine due to safety concerns (Pitofsky, 2021). According to an article on *The Hill*, 30% of Americans surveyed said they would not get the COVID-19 vaccine (Pitofsky, 2021). Of that 30%, 48% claimed they were waiting to review long-term effects and safety numbers (Pitofsky, 2021). Another survey conducted by the Center for Disease Control and Prevention states that 24% of Americans will not get the vaccine, 50% of said 24% were also waiting to see if it was safe (File & Mohanty, 2021). This meme perpetuates the idea that the vaccine is not, in fact, safe, and the U.S.

government is giving it out anyway. To learn more about the image behind this meme, visit https://knowyourmeme.com/memes/who-killed-hannibal,

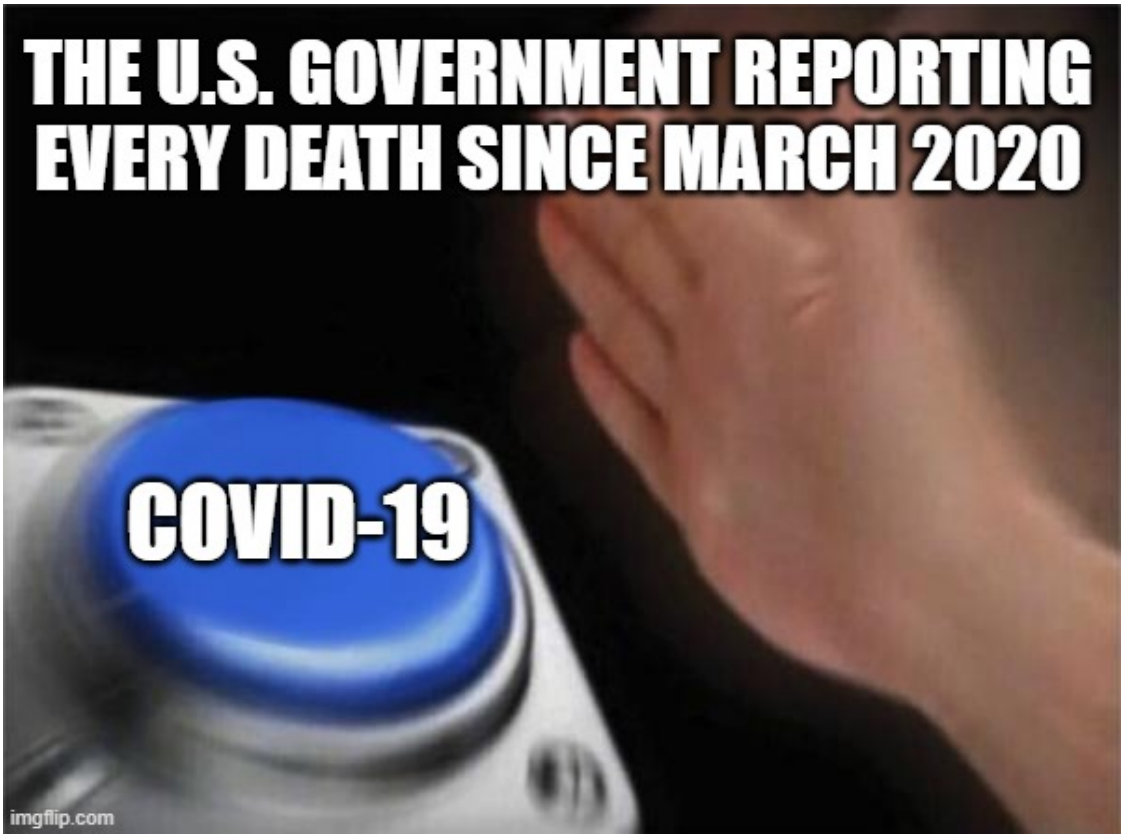

Figure 29. Meme number nine. Adapted from Lynas (2020).

Meme number nine was inspired by the conspiracy theory that death certificates are being manipulated to make all deaths a result of COVID-19 (Lynas, 2020). This conspiracy theory was perpetuated by Annie Bukacek, who spoke in a YouTube video describing the death certificate manipulation (Lynas, 2020). After amassing over 250,000 views, the doctor was exposed as a far-right, anti-vax activist likely speaking with an agenda (Lynas, 2020). Despite that knowledge, many people continue to spread this message. To learn more about the image behind this meme, visit https://knowyourmeme.com/memes/invest-button.

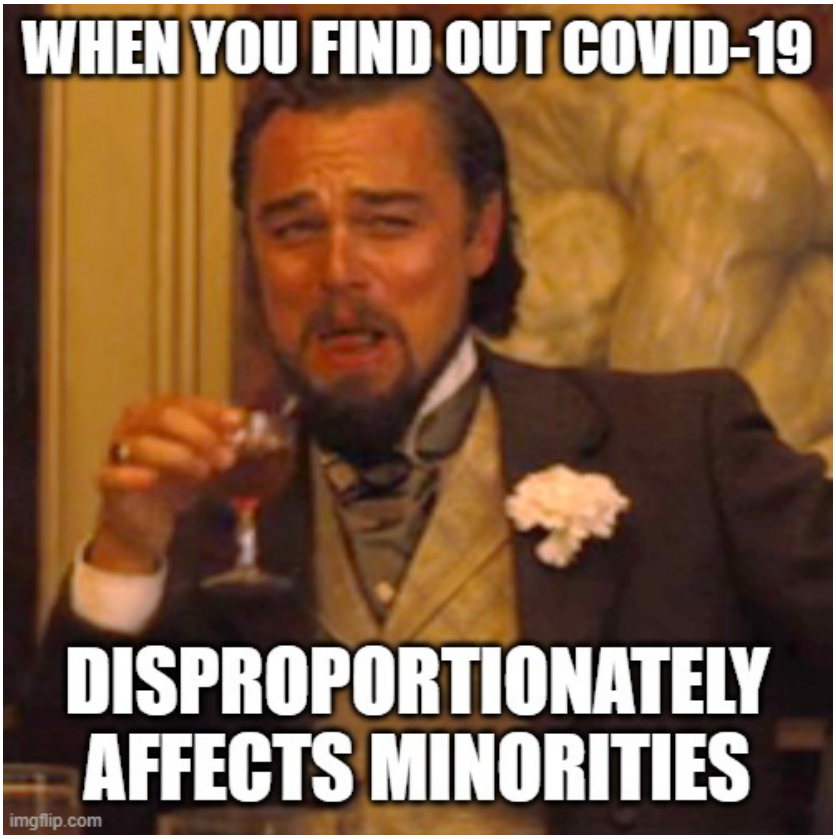

Figure 30. Meme number ten. Adapted from CDC (2021).

Meme number ten was inspired by the growing evidence that COVID-19 disproportionately affects minorities (CDC, 2021). By placing this specific image in the background, it appeals to a white nationalist audience, spreading the false idea that white people are superior to minorities. To learn more about the image behind this meme, visit https://knowyourmeme.com/memes/leonardo-dicaprio-laughing.

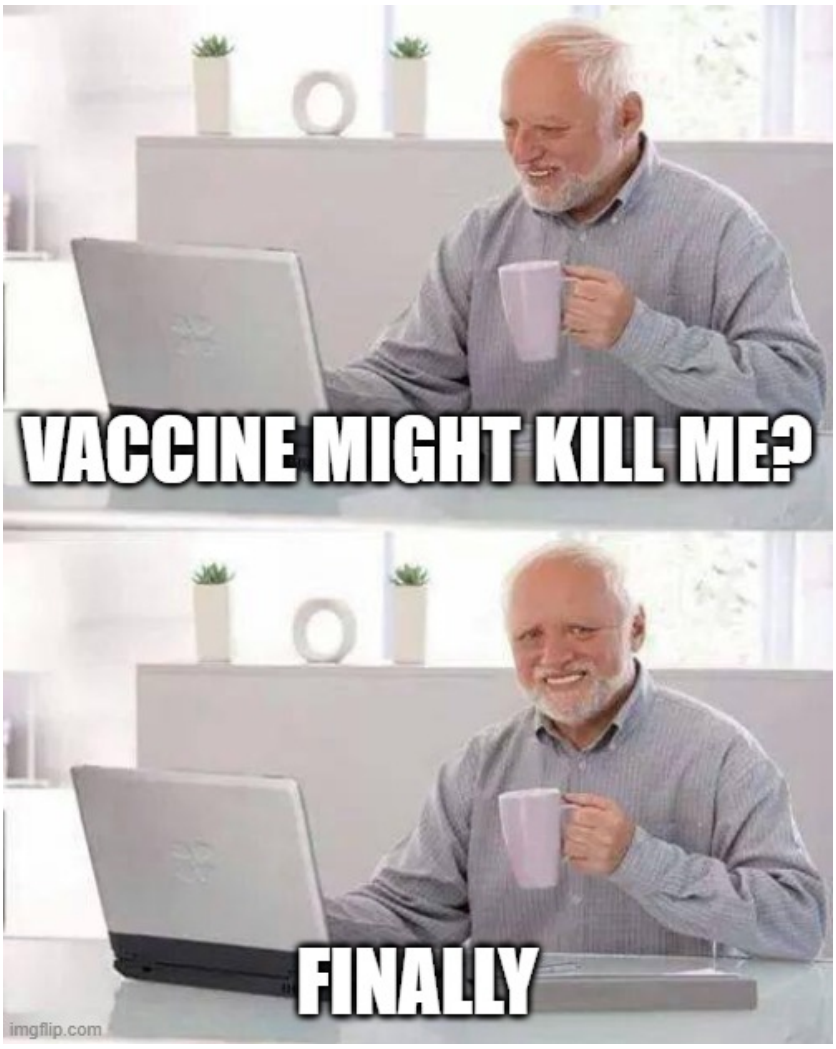

Figure 31. Meme number eleven. Adapted from Pitofsky (2020).

Meme number eleven was inspired by the same statistics presented earlier for meme eight. To learn more about the image behind this meme, visit https://knowyourmeme.com/memes/hide-the-pain-harold.

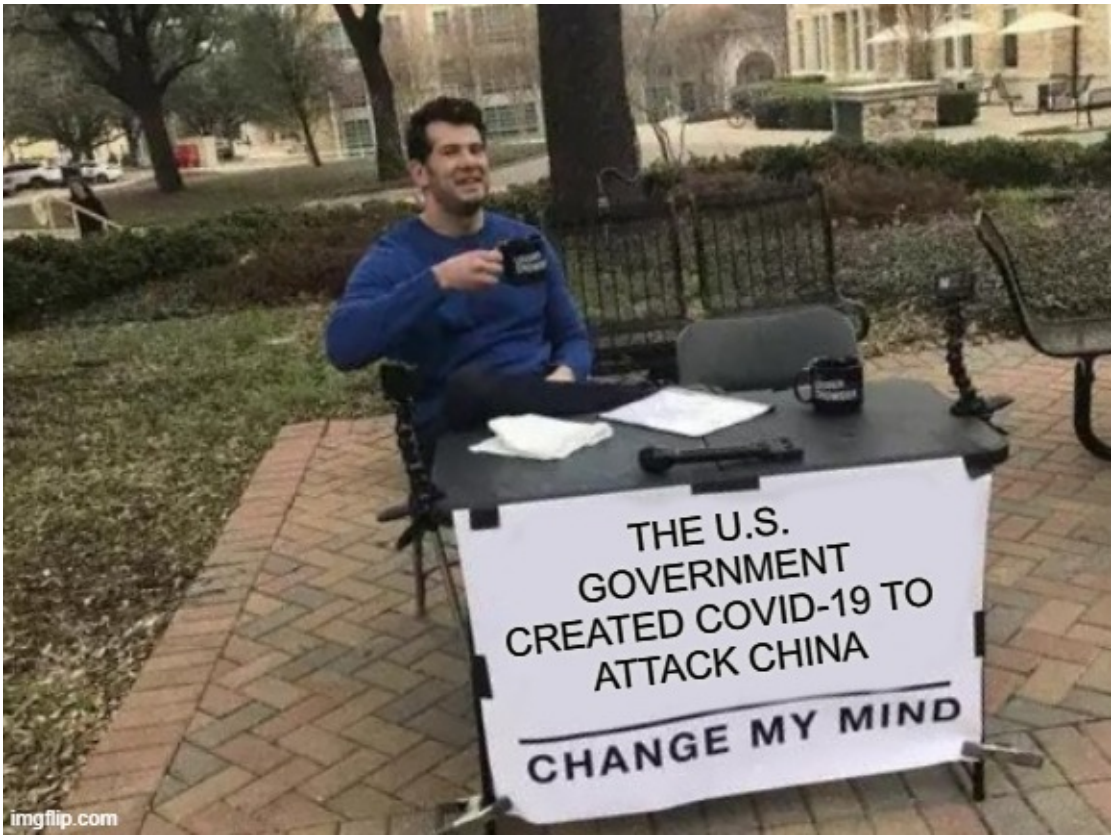

Figure 32. Meme number twelve. Adapted from Klepper et al. (2021).

Meme number twelve was influenced by the conspiracy theory that "the U.S. created the virus and used it to attack China" (Klepper et al., 2021, sec. "Igor Nikulin"). A prominent Russian political Figure, Igor Nikulin, who has supported weaponizing misinformation, appeared on Russian state television to spread this narrative 18 times between the months of January 2020 and April 2020 (Klepper et. al., 2021). To learn more about the image behind this meme, visit https://knowyourmeme.com/memes/steven-crowders-change-my-mind-campus-sign.

Figure 33. Meme number thirteen. Adapted from Lynas (2020).

Meme number thirteen was inspired by the idea that COVID-19 isn't real. David Icke and Alex Jones, both of which are professional conspiracy theorist, spread the narrative that COVID-19 was created as "a plot by the globalist elite to take away our freedoms" (Lynas, 2020, sec. "COVID-19 doesn't actually exist"). To learn more about the image behind this meme, visit https://www.dictionary.com/e/memes/expanding-brain-meme/.

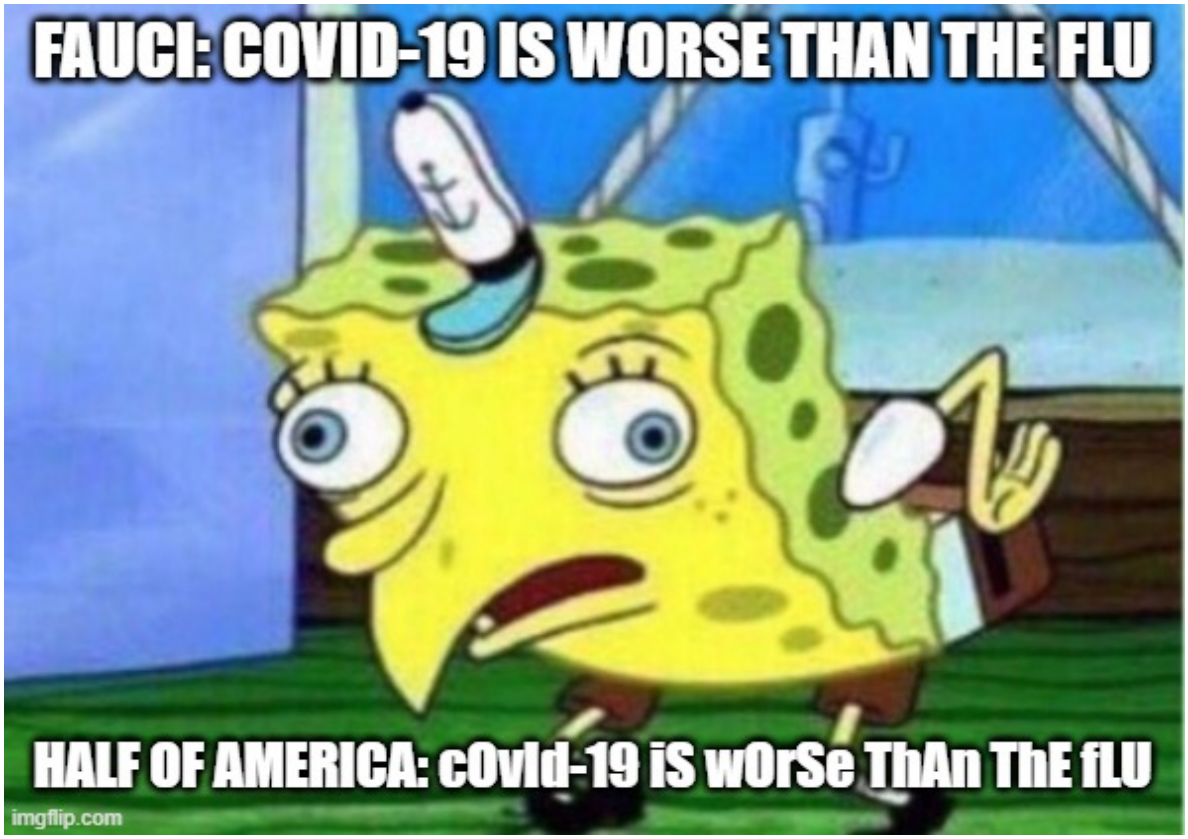

Figure 34. Meme number fourteen. Adapted from Lewis (2020).

Meme fourteen was created as a response to former President Trump's claims that the coronavirus was "no more dangerous than the seasonal influenza" (Lewis, 2020, para. 4). Many U.S. citizens went on to believe this claim because their leader was explicitly stating it (Lewis, 2020). To learn more about the image behind this meme, visit https://knowyourmeme.com/memes/mocking-spongebob.

D. QUALTRICS

To build this experiment, Qualtrics was utilized. Qualtrics is an online platform that allows users to build very complex surveys for use in data collection for businesses, research, and other organizations (Qualtrics, 2021). To build this specific experiment, a "Brand Administrator" type of account was purchased and used. After creating an account, "Create New Project" was selected and the experimental design began.

1. Steps to Create the Experiment Designed in this Thesis

1. Use the default question block to create the introduction and instructions notification. This can be done by clicking on the Q1 and keeping the question type as “Multiple Choice,” ensuring the answer type is set to “Allow one answer,” and the number of choices is set to “2.” After filling in the text and answer choices, the question behavior “Skip Logic” was added. If an individual selects “I do not wish to participate in this experiment” then he/she will be taken directly to the default end page. Figure 35 will show what text is present in the experiment designed in this thesis.

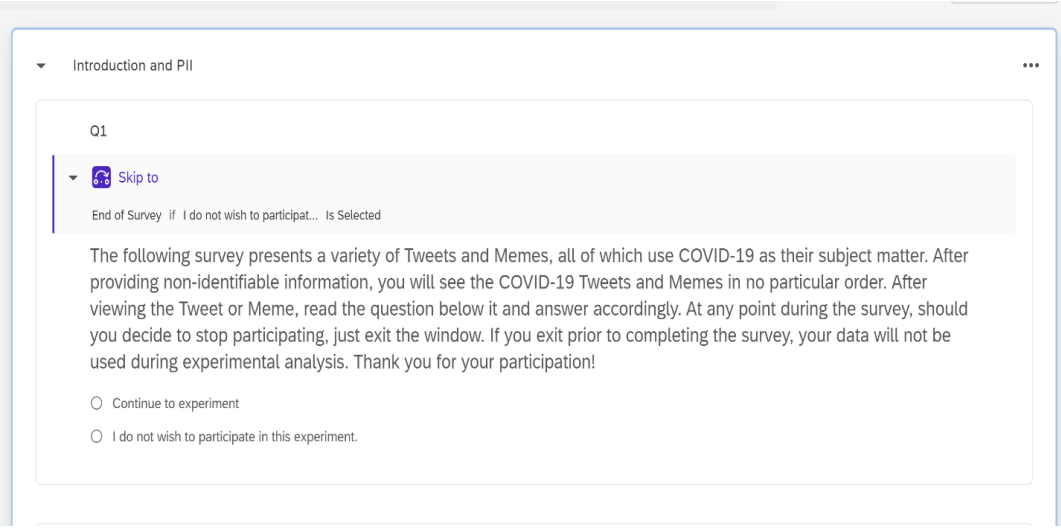

Figure 35. Question one example

2. Click the plus sign within the first question block to add another question. This question will be set up exactly like the previous question but contain consent information, which can be reviewed in Figure 36. In this case, the “skip logic” is tied to “I do not consent to participate in this experiment.”

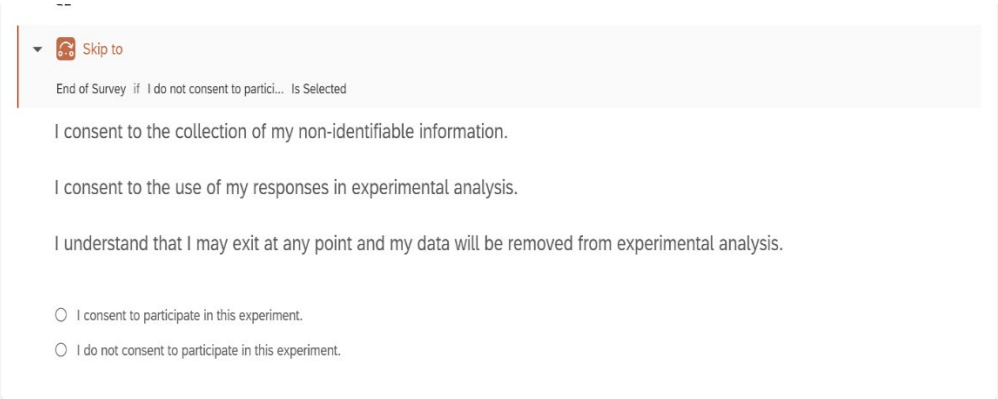

Figure 36. Question two example

3. Click the plus sign within the first question block to add another question. This question is set up like the previous two. However, it asks the participants to provide their age group, requiring seven answer choices vice two. After inputting the age groups listed in Section B of this chapter, options for "Under 18" and "58 or older" are included. Because we are not measuring individuals below/above this age range, those answer choices contain "skip logic" that takes the participant to the end of the survey.

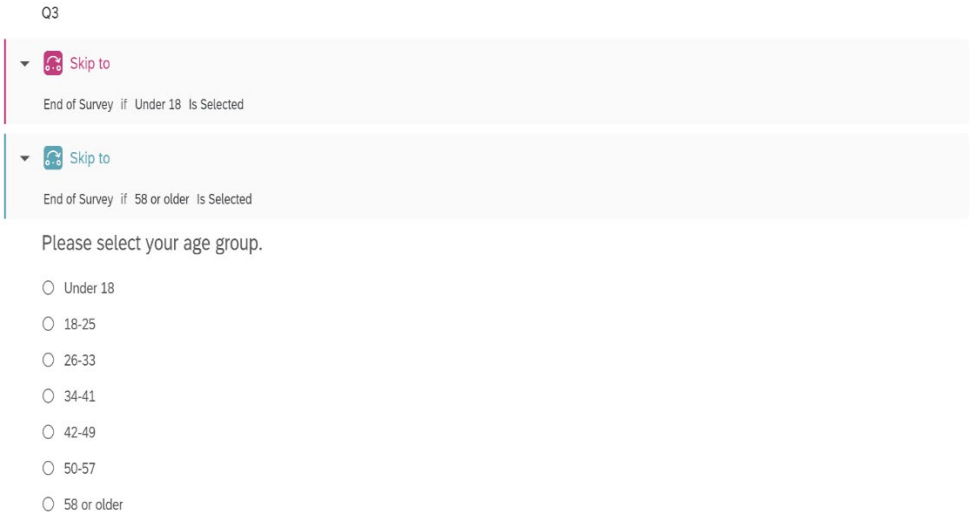

Figure 37. Question three example

Page 2541 of 3957

4. Click the plus sign within the first question block to add another question. This question is set up like the previous three. However, it asks the participants to provide their gender, requiring three answer choices. In this case, the "skip logic" is tied to "None of the Above" because one goal of the experiment is to correlate survey answers to gender. If they do not fall into a category, we cannot correlate them properly.

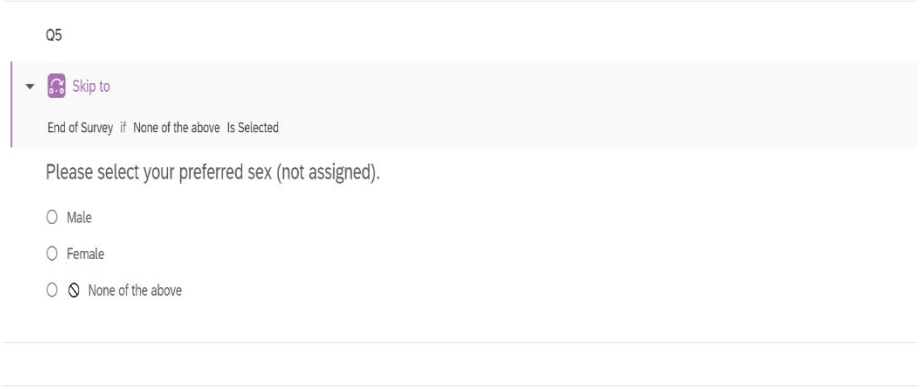

Figure 38. Question four example

5. Step 5: Click the plus sign within the first question block to add another question. This question is set up like the previous four. However, it asks the participants to provide their education level, requiring nine answer choices. In this case, the "skip logic" is tied to "None of the Above" because one goal of the experiment is to correlate survey answers to education level. If they do not fall into a category, we cannot correlate them properly.

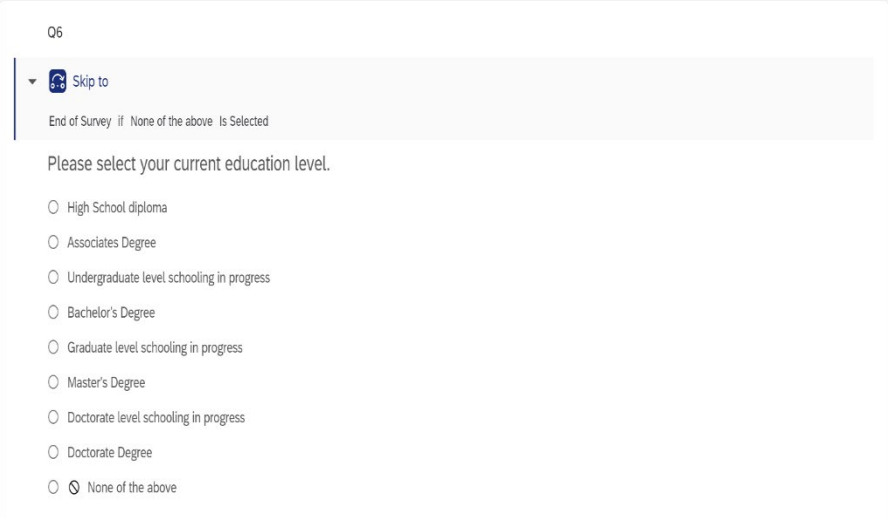

Figure 39. Question five example

6. Create a new block by selecting "Add Block." This block will be labeled "No Initial Categorization (Meme 1)." Open the block add a new "Text/Graphic" question. Then, change the content type to graphic. Without adding a graphic, add a new multiple-choice question to this block. Because this block is labeled as "No Initial Categorization," we will input question set two from Section B of this chapter, which contains eight answer choices. The block created will look like Figure 40.

Page 2543 of 3957

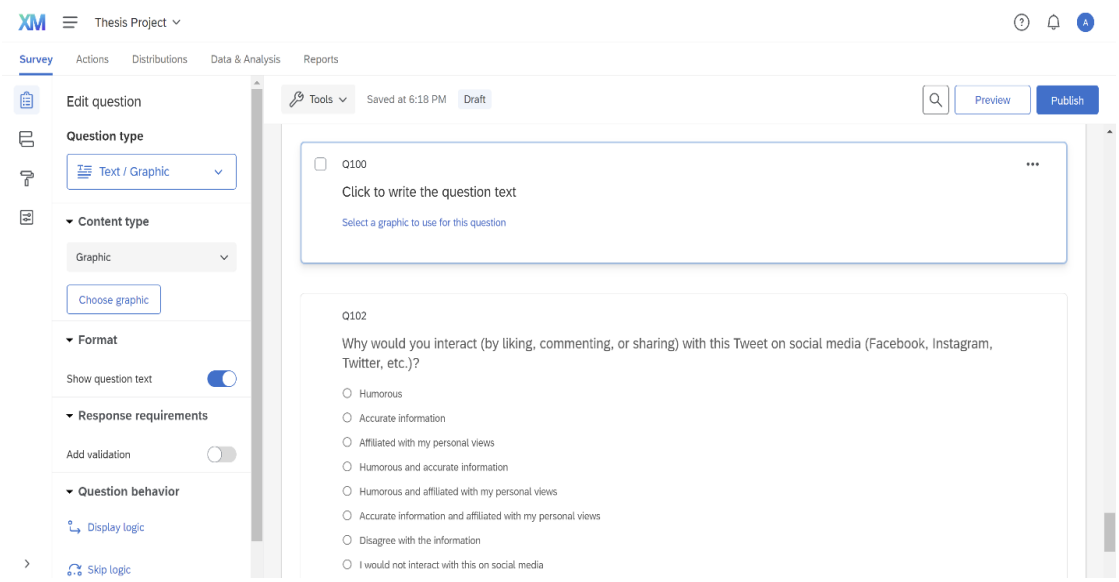

Figure 40. No initial categorization block example

7. After completing the above block, click the three dots to the right of the block title. Click "copy" and insert "No Initial Categorization (Meme 2)" into the "Please type a brief name/description of the new block:" box. After copying the block once, continue until you have created enough blocks for seven no initial categorization memes and seven no initial categorization Tweets.

8. Step 8: Create a new block and label it "Initial Categorization (Meme 1)." Add a "Text/Graphic" question to the block and change the content type to graphic. Without adding a graphic, add three new multiple-choice questions to this block. Because this block is labeled as "Initial Categorization," we will input question set one from Section B of this chapter, which contains three questions, one with two answers and two with seven answer choices. On the "IF YES" and "IF NO" questions, add the question behavior "Display Logic." Click "Question," then select the yes/no multiple-choice question in the block you are working in, and select answer choice yes/no depending on the associated question. The block created will look like Figure 41 below.

Page 2544 of 3957

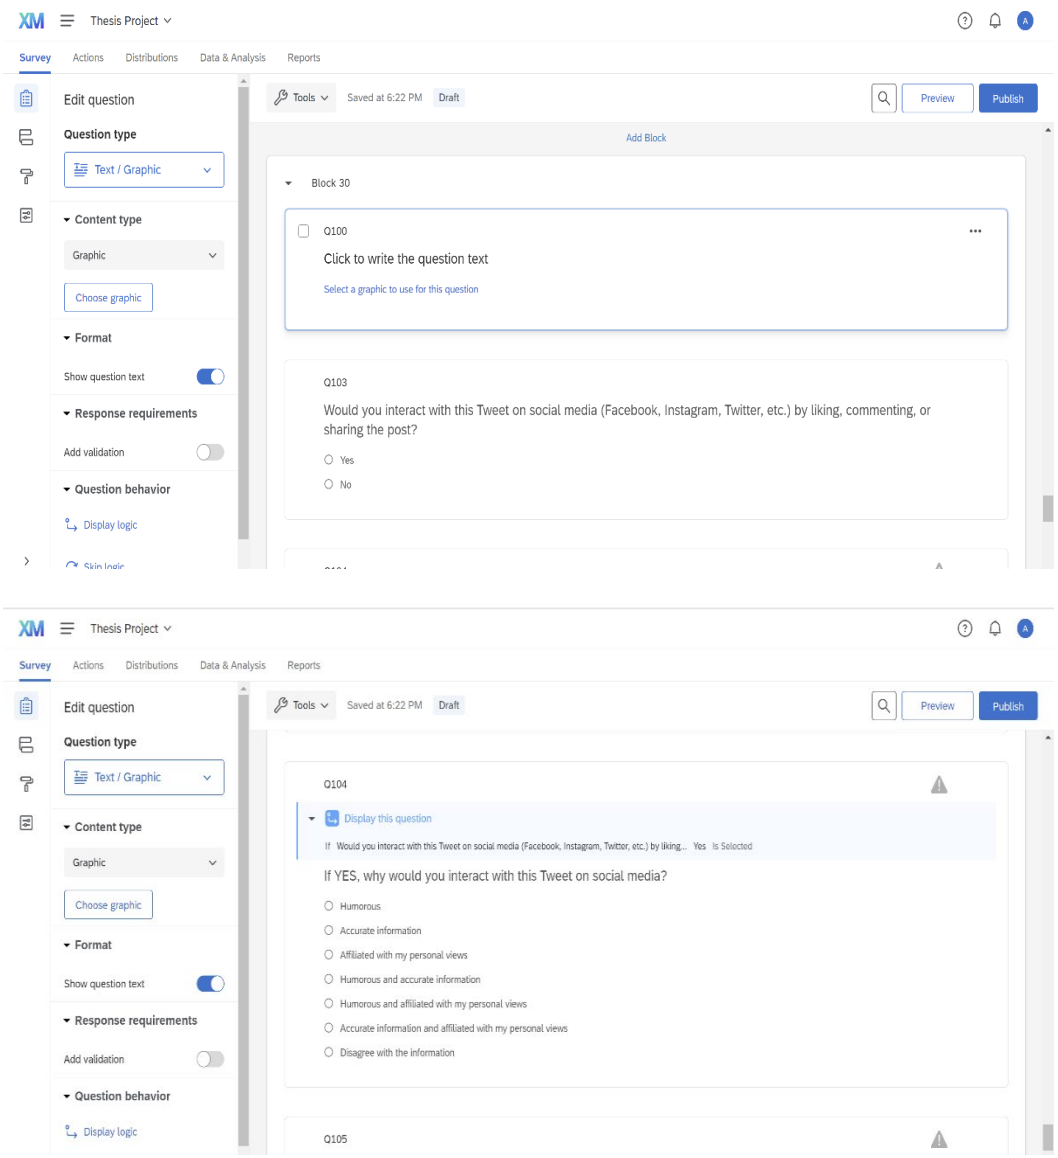

Figure 41. Initial categorization block example

9. After completing the above block, click the three dots to the right of the block title. Click “copy” and insert “Initial Categorization (Meme 2)” into the “Please type a brief name/description of the new block:” box. After copying the block once, continue until you have created enough blocks for seven initial categorization memes and seven initial categorization Tweets.

Page 2545 of 3957

10. At the top of the webpage, click the three lines next to the Qualtrics logo. After clicking, select the "Library" from the drop down. Click on "Graphic Library" right below the logo and three lines.

11. Click "New Folder" and title it "No Initial Categorization Memes." Then, hit "Upload Graphic" and upload the seven images that will be used for the "No Initial Categorization Memes." After they are uploaded, click the gray box under the first image and label it "NIC M1," which stands for "No Initial Categorization Meme 1." Label the remaining six images, ensuring to change the number after each "M."

12. Repeat step 11 until folders for "No Initial Categorization Tweets," "Initial Categorization Memes," and "Initial Categorization Tweets" are complete. Ensure that the picture labeling is altered in each new folder, accurately depicting what graphic folder and graphic number it is assigned.

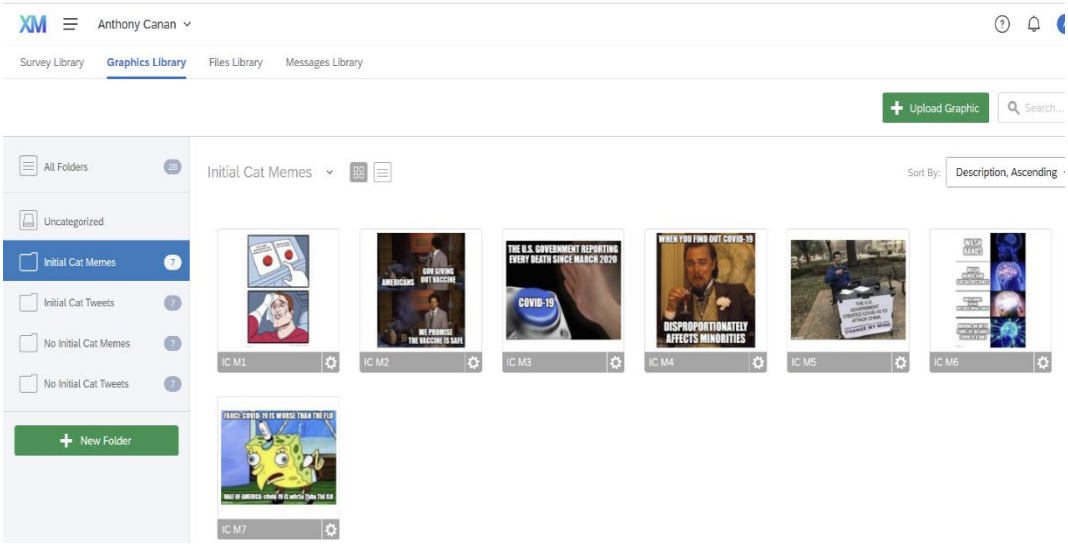

Figure 42. Complete Qualtrics image library

13. Return to your project. On the block titled "No Initial Categorization (Meme 1)," click on the empty "Text/Graphic" question. Click "Choose

Page 2546 of 3957

graphic." Match the block title to the graphic label. For example, click the image labeled "NIC M1" and it will automatically appear in the question.

14. Move to the next empty block and repeat step 13, ensuring that the block title and the graphic title match. Continue until all 28 blocks have graphics inserted.

15. Add a final block with a "Text Entry" question. This question alerts the participant that the survey is over and that all information they were presented with was false. It also requires that they acknowledge that they viewed misinformation and are complete with the survey. See Figure 43 for an example.

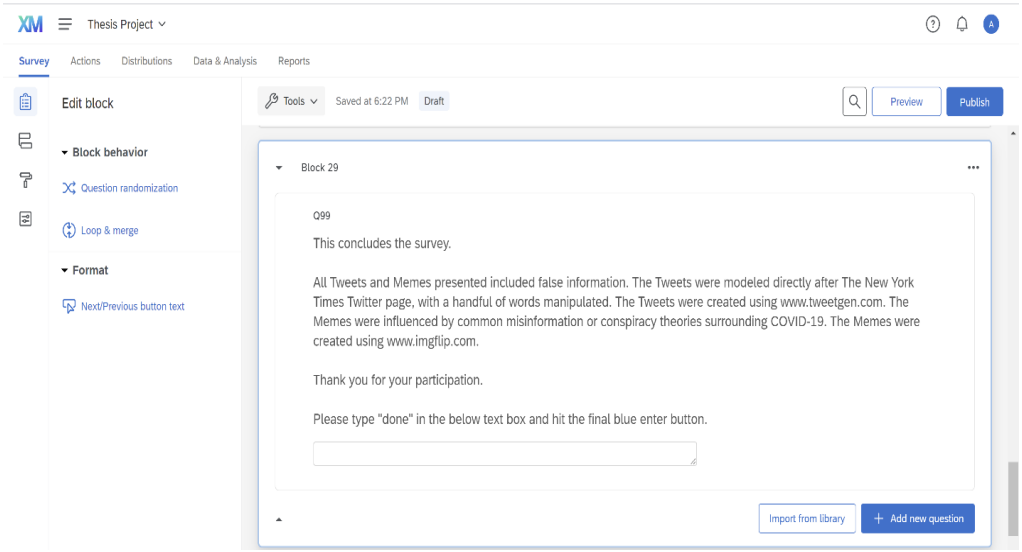

Figure 43. End of survey acknowledgement

16. Click on the "Survey Flow" icon on the left side of the screen. Currently, all the blocks will be left justified in a single line. In order to get the survey to flow like the diagram in Section B, adjustments need to be made. Click "Add a New Element Here" and select "Randomizer." On the new element, click "Evenly Present Elements." Under your new element, click "Add a New Element Here" and select "Randomizer" again. Again,

Page 2547 of 3957

click “Evenly Present Elements” on the newest “Randomizer.” Finally, under your newest element, hit “Add a New Element Here” and select “Randomizer” for a third time. Under the third “Randomizer,” click “Add a New Element Here” and select “Block.” Add all seven blocks for “No Initial Categorization (Meme X)” here. See Figure 44 for an example.

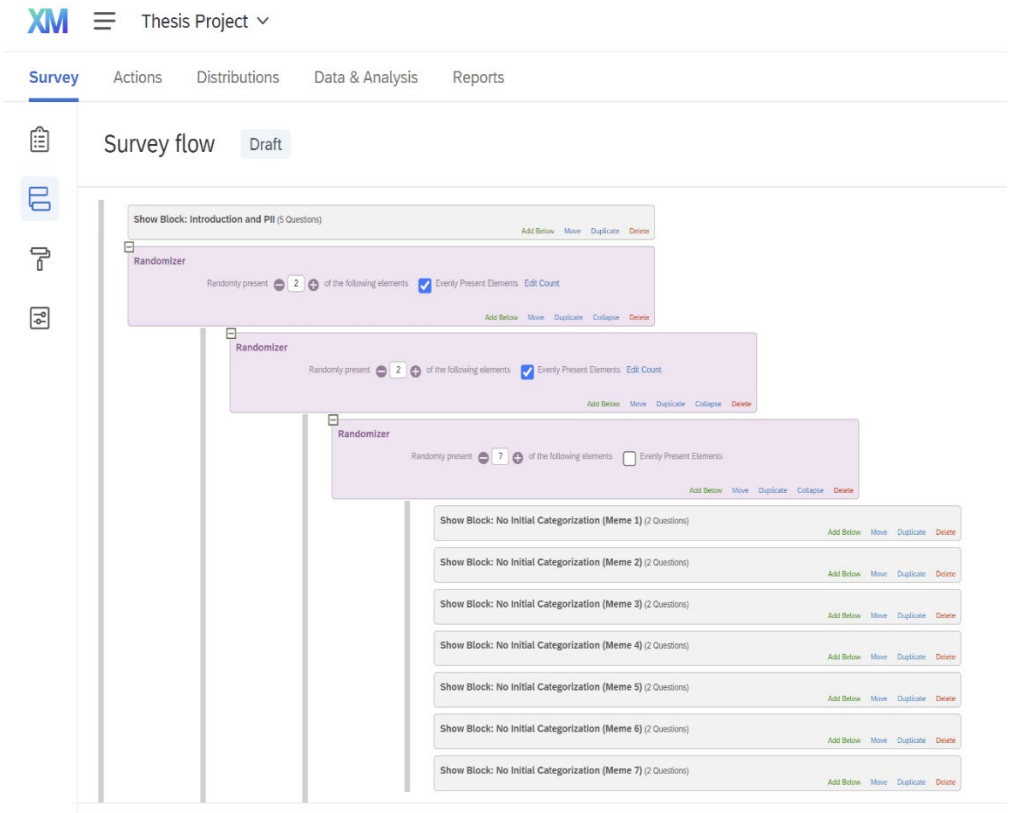

Figure 44. First set of the survey flow

17. Under your second “Randomizer,” not the most right justified, click “Add a New Element Here,” and select another “Randomizer.” Under the new “Randomizer,” add all seven of the “Initial Categorization (Meme X)” blocks. See Figure 45 for an example.

Page 2548 of 3957

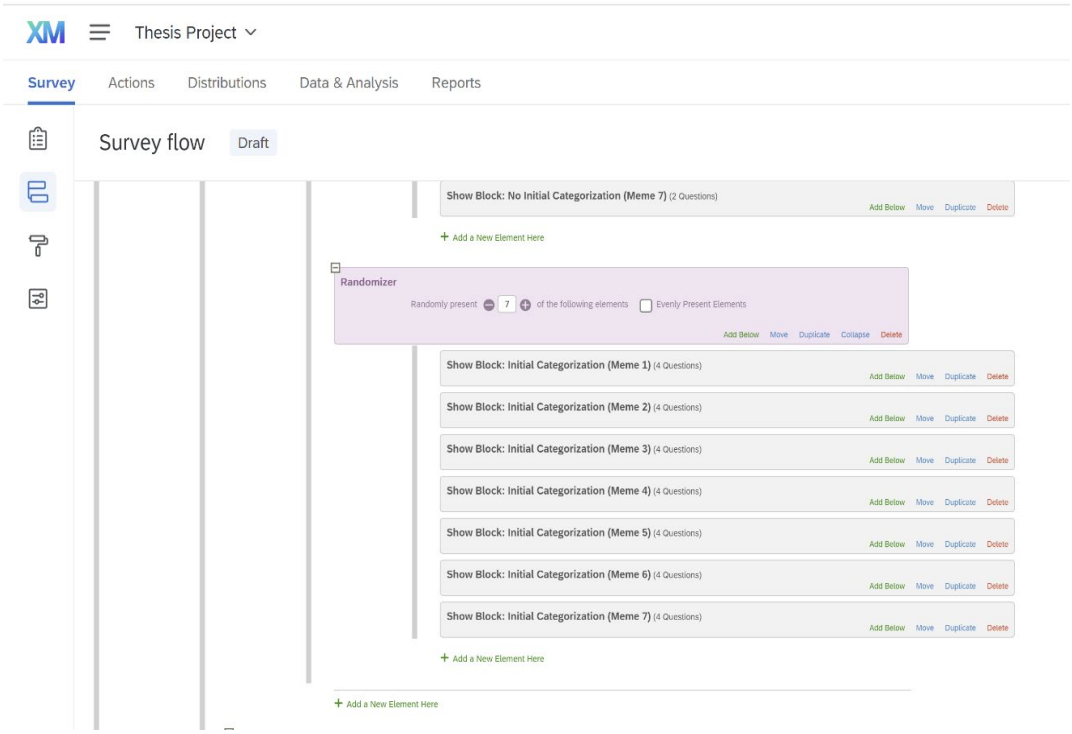

Figure 45. Second set of the survey flow

18. Under the left most justified "Randomizer," select "Add a New Element." Click "Evenly Present Elements."

19. Add an additional "Randomizer" onto the newest "Randomizer" created in step 17. Under the newest randomizer, add all seven of the "No Initial Categorization (Tweet X)" blocks. Repeat this step by adding another "Randomizer" and all seven of the "Initial Categorization (Tweet X)" blocks.

20. On the left most justified line, add a final new element as a "Block" and select "Show Block: End of Survey Acknowledgement."

21. In the top right corner, select the "Preview" button and ensure the survey is working as intended. The first page will look like Figure 46.

Page 2549 of 3957

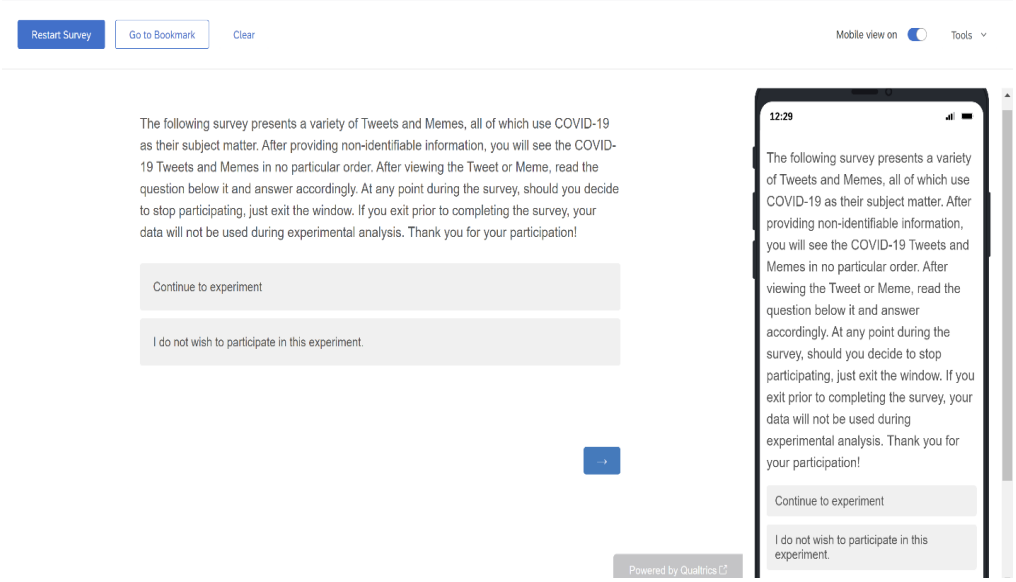

Figure 46. Preview of the survey

2. Testing the Survey

Once the Qualtrics building portion was complete, the survey was tested by four individuals, verifying that it works as intended. No results were recorded.

E. LIMITATIONS

The greatest limitation to this experimental design is the use of one type of meme. As mentioned previously, memes encompass a wide array of digital objects. This experiment, however, is only designed to draw correlations with image macro memes. Additionally, this experiment uses Tweets that only include text blurbs. On Twitter, users can imbed images and links, which may affect the way users interact with the digital objects. Finally, the experiment is designed to be run online using Mechanical Turk or a similar experiment platform. While these platforms are used to run many experiments, individuals of certain socio-economic statuses may not have means to access and perform the experiment, possibly removing a large audience from survey results.

Page 2550 of 3957

V. FUTURE WORK, IMPLICATIONS, CONCLUSION

A. FUTURE WORK

First and foremost, it is recommended that this experiment be run to its fullest capacity. Once conducted, it is recommended that researchers adjust the type of meme to test for correlations between type and the selected independent variables. Additionally, it is recommended that the Tweets be imbedded with images or links to see if that affects participant interaction rate. Finally, it is recommended that the experiment be conducted world-wide to determine if various nations respond differently to the use of Tweets and memes to spread false information.

B. IMPLICATIONS

Throughout this thesis, it has been made apparent that memes are wide-scale information dissemination tools that are poorly understood by much of academia. Despite that, memes are being utilized to spread false narratives on a global scale. While research suggests that memes reach depths greater than traditional images, and misinformation gets shared at far greater rates than true information, there is extremely limited text detailing who is responsible for this phenomenon. The experiment designed in this thesis will add to a new body of work that attempts to determine who is influenced by and propagates the majority of Tweet and meme information disorder. After conducting the experiment and drawing correlations, the relationships identified can be acted upon on both a defensive and offensive level by a multitude of entities.

If it is noted that certain genders, age groups, or education levels interact with and believe false information at greater rates than others, individuals and organizations, like the military, will be able to create and conduct targeted information disorder training. As a defensive tactic, said organizations can protect their at-risk members from falling victim to and propagating memes that involve information disorder. Whether it be political, extremist, social-activist, or marketing based, the results of this experiment, when properly acted upon, can help curb the belief and spread of dangerous narratives related to those topics.

Page 2551 of 3957

This experiment has extreme potential in the offensive realm. As noted throughout this thesis, other countries have begun using meme information disorder on American citizens. However, it is unlikely that they know who is most influenced by the narratives that they spread. The military would be able to infiltrate adversary social media platforms (which are different than the popular ones in the United States) and imbed information disorder that spreads a western narrative. Additionally, marketing firms can utilize the same tactics to reach greater levels of exposure, likely boosting sales. Conducting the experiment detailed in the previous chapter has the ability to show a more effective route to meme influence when targeting a hostile audience and provide a method for identifying potential vulnerabilities to nefarious actors' attempts to target domestic audiences.

C. CONCLUSION

The use of social media has been growing every year since inception. With that, individuals, organizations, businesses, and nations have created clever ways to spread messages to large audiences. However, in the last decade, those same entities have begun utilizing social media to spread false narratives that fit their agenda. Using Tweets and memes, non-state and state actors have successfully influenced elections, incited riots, and increased membership. Current academic research does not describe who is most susceptible to this new type of information disorder. For that reason, the experiment detailed in this thesis was designed. When conducted, it will reveal correlations between the acceptance and propagation of false information spread through Tweets and memes and the age group, gender, and education level of those most likely to interact with the false information. Once complete, defensive and offensive measures can be put in place by individuals, organizations, businesses, and nations to defend or attack the most at-risk groups.

FOR IMMEDIATE RELEASE
RELEASE: 02-23-01
FEBRUARY 23, 2024

CONTACT: NCISPUBLICAFFAIRS@NCIS.NAVY.MIL

NCIS LEADS COUNTERINTELLIGENCE INVESTIGATION RELATING TO ESPIONAGE

The Naval Criminal Investigative Service (NCIS) is leading a counterintelligence investigation of U.S. Navy Chief Petty Officer Bryce Pedicini, assigned to USS HIGGINS (DDG 76), involving several violations of the Uniform Code of Military Justice relating to espionage.

NCIS Office of Special Projects and the NCIS Far East Field Office detained and questioned Pedicini on May 19, 2023, after being suspected of removing classified information from U.S. Navy secure spaces and passing them to a representative of a foreign government as early as November 2022. Pedicini was arrested by NCIS in May 2023 and placed into pre-trial confinement by his command. He is awaiting a General Court Martial in San Diego, Calif.

On Sept. 22, 2023, charges were preferred against Pedicini by U.S. Navy Region Legal Service Office Southwest for violations of:

- Article 103a (Espionage/Attempted Espionage)
- Article 134 (Communicating Defense Information)
- Article 92 (Failure to Obey a Lawful General Order)
- Article 80 (Attempted Violation of a Lawful General Order) of the Uniform Code of Military Justice

These charges include allegations that Pedicini delivered classified and national defense information to a representative of a foreign government with reason to believe it would be harmful to the United States or advantageous to the foreign nation.

A preliminary hearing officer found there was sufficient probable cause to believe Pedicini committed the above-listed violations and recommended additional charges pertaining to conspiracy and unauthorized access on Dec. 14, 2023. The Convening Authority, Commander,

Naval Surface Force, U.S. Pacific, referred charges to a general court martial on Feb. 13, 2024. A tentative trial date is scheduled for April 2024.

This investigation is part of the ongoing efforts by NCIS to prevent the exploitation of U.S. Navy personnel by foreign adversaries. As the primary investigative and counterintelligence arm of the Department of the Navy, NCIS ensures the continued advantage of the Department of Defense and the Navy over foreign adversaries by conducting complex counterintelligence investigations and other sensitive national security matters involving the Navy and Marine Corps.

Executive Summary

In the 2011 report to Congress on *Foreign Spies Stealing U.S. Economic Secrets in Cyberspace*, the Office of the National Counterintelligence Executive provided a baseline assessment of the many dangers facing the U.S. research, development, and manufacturing sectors when operating in cyberspace, the pervasive threats posed by foreign intelligence services and other threat actors, and the industries and technologies most likely at risk of espionage. The 2018 report provides additional insight into the most pervasive nation-state threats, and it includes a detailed breakout of the industrial sectors and technologies judged to be of highest interest to threat actors. It also discusses several potentially disruptive threat trends that warrant close attention.

This report focuses on the following issues

Foreign economic and industrial espionage against the United States continues to represent a significant threat to America's prosperity, security, and competitive advantage. Cyberspace remains a preferred operational domain for a wide range of industrial espionage threat actors, from adversarial nation-states, to commercial enterprises operating under state influence, to sponsored activities conducted by proxy hacker groups. Next-generation technologies, such as Artificial Intelligence (AI) and the Internet-of-Things (IoT) will introduce new vulnerabilities to U.S. networks for which the cybersecurity community remains largely unprepared. Building an effective response will require understanding economic espionage as a worldwide, multi-vector threat to the integrity of the U.S. economy and global trade.

Foreign intelligence services—and threat actors working on their behalf—continue to represent the most persistent and pervasive cyber intelligence threat. China, Russia, and Iran stand out as three of the most capable and active cyber actors tied to economic espionage and the potential theft of U.S. trade secrets and proprietary information. Countries with closer ties to the United States also have conducted cyber espionage to obtain U.S. technology. Despite advances in cybersecurity, cyber espionage continues to offer threat actors a relatively low-cost, high-yield avenue of approach to a wide spectrum of intellectual property.

A range of potentially disruptive threat trends warrant attention. Software supply chain infiltration already threatens the critical infrastructure sector and is poised to threaten other sectors. Meanwhile, new foreign laws and increased risks posed by foreign technology companies due to their ties to host governments, may present U.S. companies with previously unforeseen threats.

Cyber economic espionage *is but one facet* of the much larger, global economic espionage challenge. We look forward to engaging in the larger public discourse on mitigating the national economic harm caused by these threats.

Scope Note

This report is submitted in compliance with the National Defense Authorization Act for Fiscal Year 2015, Section 1637, which requires that the President annually submit to Congress a report on foreign economic espionage and industrial espionage in cyberspace during the 12-month period preceding the submission of the report.

Definitions of Key Terms

For the purpose of this report, key terms were defined according to definitions provided in Section 1637 of the National Defense Authorization Act for Fiscal Year 2015.

Economic or Industrial Espionage means (a) stealing a trade secret or proprietary information or appropriating, taking, carrying away, or concealing, or by fraud, artifice, or deception obtaining, a trade secret or proprietary information without the authorization of the owner of the trade secret or proprietary information; (b) copying, duplicating, downloading, uploading, destroying, transmitting, delivering, sending, communicating, or conveying a trade secret or proprietary information without the authorization of the owner of the trade secret or proprietary information; or (c) knowingly receiving, buying, or possessing a trade secret or proprietary information that has been stolen or appropriated, obtained, or converted without the authorization of the owner of the trade secret or proprietary information.

Cyberspace means (a) the interdependent network of information technology infrastructures; and (b) includes the Internet, telecommunications networks, computer systems, and embedded processors and controllers.

Contributors

The National Counterintelligence and Security Center (NCSC) compiled this report, with close support from the Cyber Threat Intelligence Integration Center (CTIIC), and with input and coordination from many U.S. Government organizations, including the Central Intelligence Agency (CIA), Defense Cyber Crime Center (DC3), Defense Intelligence Agency (DIA), Defense Security Service (DSS), Department of Energy (DoE), Department of Defense (DoD), Department of Homeland Security (DHS), Department of State (DoS), Department of Treasury (Treasury), Federal Bureau of Investigation (FBI), National Cyber Investigative Joint Task Force (NCIJTF), National Geospatial-Intelligence Agency (NGA), National Reconnaissance Office (NRO), National Security Agency (NSA), and Office of the Director of National Intelligence (ODNI).

Page 2570 of 3957

I. The Strategic Threat of Cyber Economic Espionage

Foreign economic and industrial espionage against the United States continues to represent a significant threat to America's prosperity, security, and competitive advantage. Cyberspace remains a preferred operational domain for a wide range of industrial espionage threat actors, from adversarial nation-states, to commercial enterprises operating under state influence, to sponsored activities conducted by proxy hacker groups. Next-generation technologies such as Artificial Intelligence (AI) and the Internet-of-Things (IoT) will introduce new vulnerabilities to U.S. networks for which the cybersecurity community remains largely unprepared. Building an effective response demands understanding economic espionage as a worldwide, multi-vector threat to the integrity of the U.S. economy and global trade.

The United States remains a global center for research, development, and innovation across multiple high-technology sectors. Federal research institutions, universities, and corporations are regularly targeted by online actors seeking all manner of proprietary information and the overall long-term trend remains worrisome.

While next generation technologies will introduce a range of qualitative advances in data storage, analytics, and computational capacity, they also present potential vulnerabilities for which the cybersecurity community remains largely unprepared. The solidification of cloud computing over the past decade as a global information industry standard, coupled with the deployment of technologies such as AI and IoT, will introduce unforeseen vulnerabilities to U.S. networks.

- **Cloud networks and IoT infrastructure are rapidly expanding the global online operational space.** Threat actors have already demonstrated how cloud can be used as a platform for cyber exploitation. As IoT and AI applications expand to empower everything from "smart homes" to "smart cities", billions of potentially unsecured network nodes will create an incalculably larger exploitation space for cyber threat actors.

- **Lack of industry standardization during this pivotal first-generation deployment period will likely hamper the development of comprehensive security solutions in the near-term.**

- **Building an effective response demands understanding economic espionage as a worldwide, multi-vector threat to the integrity of both the U.S. economy and global trade.** Whereas cyberspace is a preferred operational domain for economic espionage, it is but one of many. Sophisticated threat actors, such as adversarial nation-states, combine cyber exploitation with supply chain operations, human recruitment, and the acquisition of knowledge by foreign students in U.S. universities, as part of a strategic technology acquisition program.

Page 2572 of 3957

II. Threats from Foreign Countries

Foreign intelligence services—and threat actors working on their behalf—continue to represent the most persistent and pervasive cyber intelligence threat. China, Russia, and Iran stand out as three of the most capable and active cyber actors tied to economic espionage and the potential theft of U.S. trade secrets and proprietary information. Countries with closer ties to the United States have also conducted cyber espionage to obtain U.S. technology. Despite advances in cybersecurity, cyber espionage continues to offer threat actors a relatively low-cost, high-yield avenue of approach to a wide spectrum of intellectual property.

We anticipate that China, Russia, and Iran will remain aggressive and capable collectors of sensitive U.S. economic information and technologies, particularly in cyberspace. All will almost certainly continue to deploy significant resources and a wide array of tactics to acquire intellectual property and proprietary information.

Countries with closer ties to the United States have conducted cyber espionage and other forms of intelligence collection to obtain U.S. technology, intellectual property, trade secrets, and proprietary information. U.S. allies or partners often take advantage of the access they enjoy to collect sensitive military and civilian technologies and to acquire know-how in priority sectors.

China: Persistent Cyber Activities

China has expansive efforts in place to acquire U.S. technology to include sensitive trade secrets and proprietary information. It continues to use cyber espionage to support its strategic development goals—science and technology advancement, military modernization, and economic policy objectives. China's cyberspace operations are part of a complex, multipronged technology development strategy that uses licit and illicit methods to achieve its goals. Chinese companies and individuals often acquire U.S. technology for commercial and scientific purposes. At the same time, the Chinese government seeks to enhance its collection of U.S. technology by enlisting the support of a broad range of actors spread throughout its government and industrial base.

Page 2573 of 3957

China's Strategic Goals

Non-Traditional Collectors	China uses individuals for whom science or business is their primary profession to target and acquire US technology.
Joint Ventures (JV)	China uses JVs to acquire technology and technical know-how.
Research partnerships	China actively seeks partnerships with government laboratories-such as the Department of Energy labs-to learn about and acquire specific technology, and the soft skills necessary to run such facilities.
Academic Collaborations	China uses collaborations and relationships with universities to acquire specific research and gain access to high-end research equipment. Its policies state it should exploit the openness of academia to fill China's strategic gaps.
S&T Investments	China has sustained, long-term state investments in its S&T infrastructure.
M&A	China seeks to buy companies that have technology, facilities and people. These sometimes end up as Committee on Foreign Investment in the United States (CFIUS) cases.
Front Companies	China uses front companies to obscure the hand of the Chinese government and acquire export controlled technology.
Talent Recruitment Programs	China uses its talent recruitment programs to find foreign experts to return to China and work on key strategic programs.
Intelligence Services	The Ministry of State Security (MSS), and military intelligence offices are used in China's technology acquisition efforts.
Legal and Regulatory Environment	China uses its laws and regulations to disadvantage foreign companies and advantage its own companies.

Page 2574 of 3957

The Intelligence Community and private sector security experts continue to identify ongoing Chinese cyber activity, although at lower volumes than existed before the bilateral September 2015 U.S.-China cyber commitments. Most Chinese cyber operations against U.S. private industry that have been detected are focused on cleared defense contractors or IT and communications firms whose products and services support government and private sector networks worldwide. Examples of identified ongoing Chinese cyber activity include the following:

- According to several cyber intelligence companies, in 2017 the China-associated cyber espionage group APT10 continued widespread operations to target engineering, telecommunications, and aerospace industries. APT10 targeted companies across the globe, including the United States, using its exploitation of managed IT service providers as a means to conduct such operations.
- Cybersecurity researchers have found links between Chinese cyber actors and a back door in the popular CCleaner application that allowed the actors to target U.S. companies, including Google, Microsoft, Intel, and VMware.
- In November 2017, PricewaterhouseCoopers (PWC) reported that the China-based APT, known as KeyBoy, was shifting its focus to target Western organizations. According to PWC, the targeting likely was for corporate espionage purposes. KeyBoy previously focused on Asian targets, according to commercial cybersecurity reporting.
- According to FireEye, in 2017 TEMP.Periscope continued targeting the maritime industry as well as engineering-focused entities including research institutes, academic organizations, and private firms in the United States. FireEye has detected sharp increases in targeting in early 2018 as well.

Recent Unsealed U.S. Indictment With a Link to China

In November 2017, Wu Yingzhuo, Dong Hao and Xia Lei, Chinese nationals and residents of China, were charged with computer hacking, theft of trade secrets, conspiracy, and identity theft. These efforts were directed at U.S. and foreign employees and the computers of three corporations that were victims in the financial, engineering, and technology industries between 2011 and May 2017.

We believe that China will continue to be a threat to U.S. proprietary technology and intellectual property through cyber-enabled means or other methods. If this threat is not addressed, it could erode America's long-term competitive economic advantage.

Russia: A Sophisticated Adversary

The threat to U.S. technology from Russia will continue over the coming years as Moscow attempts to bolster an economy struggling with endemic corruption, state control, and a loss of talent departing for jobs abroad. Moscow's military modernization efforts also likely will be a motivating factor for Russia to steal U.S. intellectual property. An aggressive and capable collector of sensitive U.S. technologies, Russia uses cyberspace as one of many methods for obtaining the necessary know-how and technology to grow and modernize its economy. Other methods include the following:

- Use of Russian commercial and academic enterprises that interact with the West;
- Recruitment of Russian immigrants with advanced technical skills by the Russian intelligence services; and
- Russian intelligence penetration of public and private enterprises, which enable the government to obtain sensitive technical information from industry.

Russia uses cyber operations as an instrument of intelligence collection to inform its decision-making and benefit its economic interests. Experts contend that Russia needs to enact structural reforms, including economic diversification into sectors such as technology, to achieve the higher rate of gross domestic product growth publicly called for by Russian President Putin. In support of that goal, Russian intelligence services have conducted sophisticated and large-scale hacking operations to collect sensitive U.S. business and technology information. In addition, Moscow uses a range of other intelligence collection operations to steal valuable economic data:

- In 2016, the hacker "Eas7" confided to Western press that she had collaborated with the Russian Federal Security Service (FSB) on economic espionage missions. She estimated that "among the good hackers, at least half works (sic) for government structures," suggesting Moscow employs cyber criminals as a way to make such operations plausibly deniable.
- Moscow has used cyber operations to collect intellectual property data from U.S. energy, healthcare, and technology companies. For example, Russian Government hackers last year compromised dozens of U.S. energy firms, including their operational networks. This activity could be driven by multiple objectives, including collecting intelligence, developing accesses for disruptive purposes, and providing sensitive U.S. intellectual property to Russian companies.
- Since at least 2007, the Russian state-sponsored cyber program APT28 has routinely collected intelligence on defense and geopolitical issues, including those relating to the United States and Western Europe. Obtaining sensitive U.S. defense industry data could provide Moscow with economic (e.g. in foreign military sales) and security advantages as Russia continues to strengthen and modernize its military forces.

Page 2576 of 3957

Recent Unsealed U.S. Indictment with a Link to Russia

In March 2017, the United States Department of Justice indicted two FSB officials and their Russian cybercriminal conspirators on computer hacking and conspiracy charges related to the collection of emails of U.S. and European employees of transportation and financial services firms. The charges included conspiring to engage in economic espionage and theft of trade secrets.

We believe that Russia will continue to conduct aggressive cyber operations during the next year against the United States and its allies as part of a global intelligence collection program focused on furthering its security interests. Although cyber operations are just one element of Russia's multipronged approach to information collection, they give Russia's intelligence services a more agile and cost-efficient tool to accomplish Moscow's objectives. Indeed, Russian cyber actors are continuing to develop their cyber tradecraft—such as using open-source hacking tools that minimize forensic connections to Russia.

Iran: An Increasing Cyber Threat

Iranian cyber activities are often focused on Middle Eastern adversaries, such as Saudi Arabia and Israel; however, in 2017 Iran also targeted U.S. networks. A subset of this Iranian cyber activity aggressively targeted U.S. technologies with high value to the Iranian government. The loss of sensitive information and technologies not only presents a significant threat to U.S. national security. It also enables Tehran to develop advanced technologies to boost domestic economic growth, modernize its military forces, and increase its foreign sales. Examples of recent Iranian cyber activities include the following:

- The Iranian hacker group Rocket Kitten consistently targets U.S. defense firms, likely enabling Tehran to improve its already robust missile and space programs with proprietary and sensitive U.S. military technology.
- Iranian hackers target U.S. aerospace and civil aviation firms by using various website exploitation, spearphishing, credential harvesting, and social engineering techniques.
- The OilRig hacker group, which historically focuses on Saudi Arabia, has increased its targeting of U.S. financial institutions and information technology companies.
- The Iranian hacker group APT33 has targeted energy sector companies as part of Iran's national priorities for improving its petrochemical production and technology.
- Iranian hackers have targeted U.S. academic institutions, stealing valuable intellectual property and data.

Page 2577 of 3957

Recent Unsealed U.S. Indictments with a Link to Iran

In July 2017, Iranian nationals Mohammed Reza Rezakhah and Mohammed Saeed Ajily were charged with hacking into U.S. software companies, stealing their proprietary software, and selling the stolen software to Iranian universities, military and government entities, and other buyers outside of the United States.

In November 2017, Iranian national Behzad Mesri was charged with allegedly hacking HBO's corporate systems, stealing intellectual property and proprietary data, to include scripts and plot summaries for unaired episodes. Mesri had previously hacked computer systems for the Iranian military and has been a member of an Iran-based hacking group called the Turk Black Hat security team.

In March 2018, nine Iranian hackers associated with the Mabna Institute were charged with stealing intellectual property from more than 144 U.S. universities which spent approximately $3.4 billion to procure and access the data. The data was stolen at the behest of Iran's Islamic Revolutionary Guard Corps and used to benefit the government of Iran and other Iranian customers, including Iranian universities. Mabna Institute actors also targeted and compromised 36 U.S. businesses.

We believe that Iran will continue working to penetrate U.S. networks for economic or industrial espionage purposes. Iran's economy—still driven heavily by petroleum revenue—will depend on growth in nonoil industries and we expect Iran will continue to exploit cyberspace to gain advantages in these industries. Iran will remain committed to using its cyber capabilities to attain key economic goals, primarily by continuing to steal intellectual property, in an effort to narrow the science and technology gap between Iran and Western countries.

Page 2578 of 3957

Targeted Technologies

Although many aspects of U.S. economic activity and technology are of potential interest to foreign intelligence collectors, we judge that the highest interest is in the following areas:

Industry	Priority Sectors / Technologies	
Energy / Alternative Energy	• Advanced pressurized water reactor and high-temperature, gas-cooled nuclear power stations • Biofuels • Energy-efficient industries	• Oil, gas, and coalbed methane development, including fracking • Smart grids • Solar energy technology • Wind turbines
Biotechnology	• Advanced medical devices • Biomanufacturing and chemical manufacturing • Biomaterials	• Biopharmaceuticals • Genetically modified organisms • Infectious disease treatment • New vaccines and drugs
Defense Technology	• Aerospace & Aeronautic Systems • Armaments	• Marine Systems • Radar • Optics
Environmental Protection	• Batteries • Energy-efficient appliances • Green building materials	• Hybrid and electric cars • Waste management • Water/air pollution control
High-End Manufacturing	• 3D printing • Advanced robotics • Aircraft engines • Aviation maintenance and service sectors • Civilian aircraft • Electric motors • Foundational manufacturing equipment	• High-end computer numerically controlled machines • High-performance composite materials • High-performance sealing materials • Integrated circuit manufacturing equipment and assembly technology • Space infrastructure and exploration technology • Synthetic rubber
Information and Communications Technology	• Artificial intelligence • Big data analysis • Core electronics industries • E-commerce services • Foundational software products • High-end computer chips • Internet of Things	• Network equipment • Next-generation broadband wireless communications networks • Quantum computing and communications • Rare-earth materials

Page 2579 of 3957

III. Emerging Threats

A range of other potentially disruptive threats warrant attention. Software supply chain infiltration has already threatened the critical infrastructure sector and could threaten other sectors as well. Meanwhile, new foreign laws and increased risks posed by foreign technology companies due to their ties to host governments, may present U.S. companies with previously unforeseen threats.

Cyber threats will continue to evolve with technological advances in the global information environment. The following are emerging areas of concern that are likely to disrupt security procedures and expand the opportunities for collection of sensitive U.S. economic and technology information.

Software Supply Chain Operations

Last year represented a watershed in the reporting of software supply chain operations. In 2017, seven significant events were reported in the public domain compared to only four between 2014 and 2016. As the number of events grows, so too are the potential impacts. Hackers are clearly targeting software supply chains to achieve a range of potential effects to include cyber espionage, organizational disruption, or demonstrable financial impact:

- Floxif infected 2.2 million worldwide CCleaner customers with a backdoor. The hackers specifically targeted 18 companies and infected 40 computers to conduct espionage to gain access to Samsung, Sony, Asus, Intel, VMWare, O2, Singtel, Gauselmann, Dyn, Chunghwa and Fujitsu.

- Hackers corrupted software distributed by the South Korea-based firm Netsarang, which sells enterprise and network management tools. The backdoor enabled downloading of further malware or theft of information from hundreds of companies in energy, financial services, manufacturing, pharmaceuticals, telecommunications, and transportation industries.

- A tweaked version of M.E. Doc was infected with a backdoor to permit the delivery of software from the Ukrainian accounting firm a destructive payload disguised as ransomware. This attack, which was attributed to Russia, paralyzed networks worldwide, shutting down or affecting operations of banks, companies, transportation, and utilities. The cost of this attack to FedEx and Maersk was approximately $300 million each.

- A malware operation dubbed Kingslayer, targeted system administrator accounts associated with U.S. firms to steal credentials in order to breach the system and replace the legitimate application and updates with a malware version containing an embedded backdoor. Although it is not known which and how many firms were ultimately infected, at least one U.S. defense contractor was targeted and compromised.

Foreign Laws Could Enable Intellectual Property Theft

New and enhanced cyber, national security, and import laws in effect in foreign countries are posing an increasing risk to U.S. technology and propriety information. For example, in 2017, China and Russia aggressively enforced laws that bolstered their domestic companies at the expense of U.S. companies and also might allow their companies access to U.S. intellectual property and proprietary information.

In 2017, China put into effect a new cyber security law that restricts sales of foreign information and communication technology (ICT) and mandates that foreign companies submit ICT for government-administered national security reviews. The law also requires that firms operating in China store their data in China, and it requires government approval prior to transferring data outside China. The U.S. Chamber of Commerce has gone on record to explain that if a foreign company is forced to localize a valuable set of data or information in China, whether for research and development purposes or simply to conduct its business, it will have to assume a significant amount of risk. Its data or information may be misappropriated or misused, especially given the environment in China, where companies face significant legal and other uncertainties when they try to protect their data and information.

Required Steps for U.S. Companies to Do Business in China

1. Pass National Security Reviews for Technology and Services
2. Store All Data in China
3. Form Joint Venture to Open Data Center
4. Obtain Government Approval for Data Transfers
5. Buy Government-Approved Encryption and Virtual Private Networks (VPNs)

▶ China has Access to U.S. Intellectual Property and Proprietary Information

Page 2581 of 3957

Similarly, in recent years Russia has dramatically increased its demand for source code reviews for foreign technology being sold inside the country. Russia's Federal Security Service (FSB), associated with economic espionage missions in the past, serves as the authority charged with directing these source code reviews and approving the sale of technology products and services sold inside Russia.

High intelligence threat countries, such as China and Russia, could exploit these laws to significantly improve their access to the intellectual property of foreign companies operating in their countries and subsequently share this sensitive information with domestic firms.

Foreign Technology Companies with Links to Host Governments

Foreign information and communications technology companies are often subject to foreign state influence. This presents a risk to U.S. trade secrets and intellectual property. These companies provide valuable services that often require access to the physical and logical control points of the computers and networks they support. These unique accesses also present an opportunity for foreign countries to obtain sensitive proprietary information. Recent events underscore the potential risks posed by technology companies that have links to foreign governments with high threat intelligence services:

- Recent Chinese laws—including laws on national security and cybersecurity—provide Beijing a legal basis to compel technology companies operating in China to cooperate with Chinese security services.
- In September 2017, the Department of Homeland Security issued a directive to Federal departments and agencies to remove Kaspersky Lab products and services based on the information security risks posed by the company and its links to Russia.
- In December 2017, the Department of Justice made public an agreement with Netcracker Technology Corp. that resulted in the company agreeing that it would not store sensitive information and data from its U.S.-based technology clients in overseas locations, including most notably Russia.

Annex – Decreasing the Prevalence of Economic or Industrial Espionage in Cyberspace

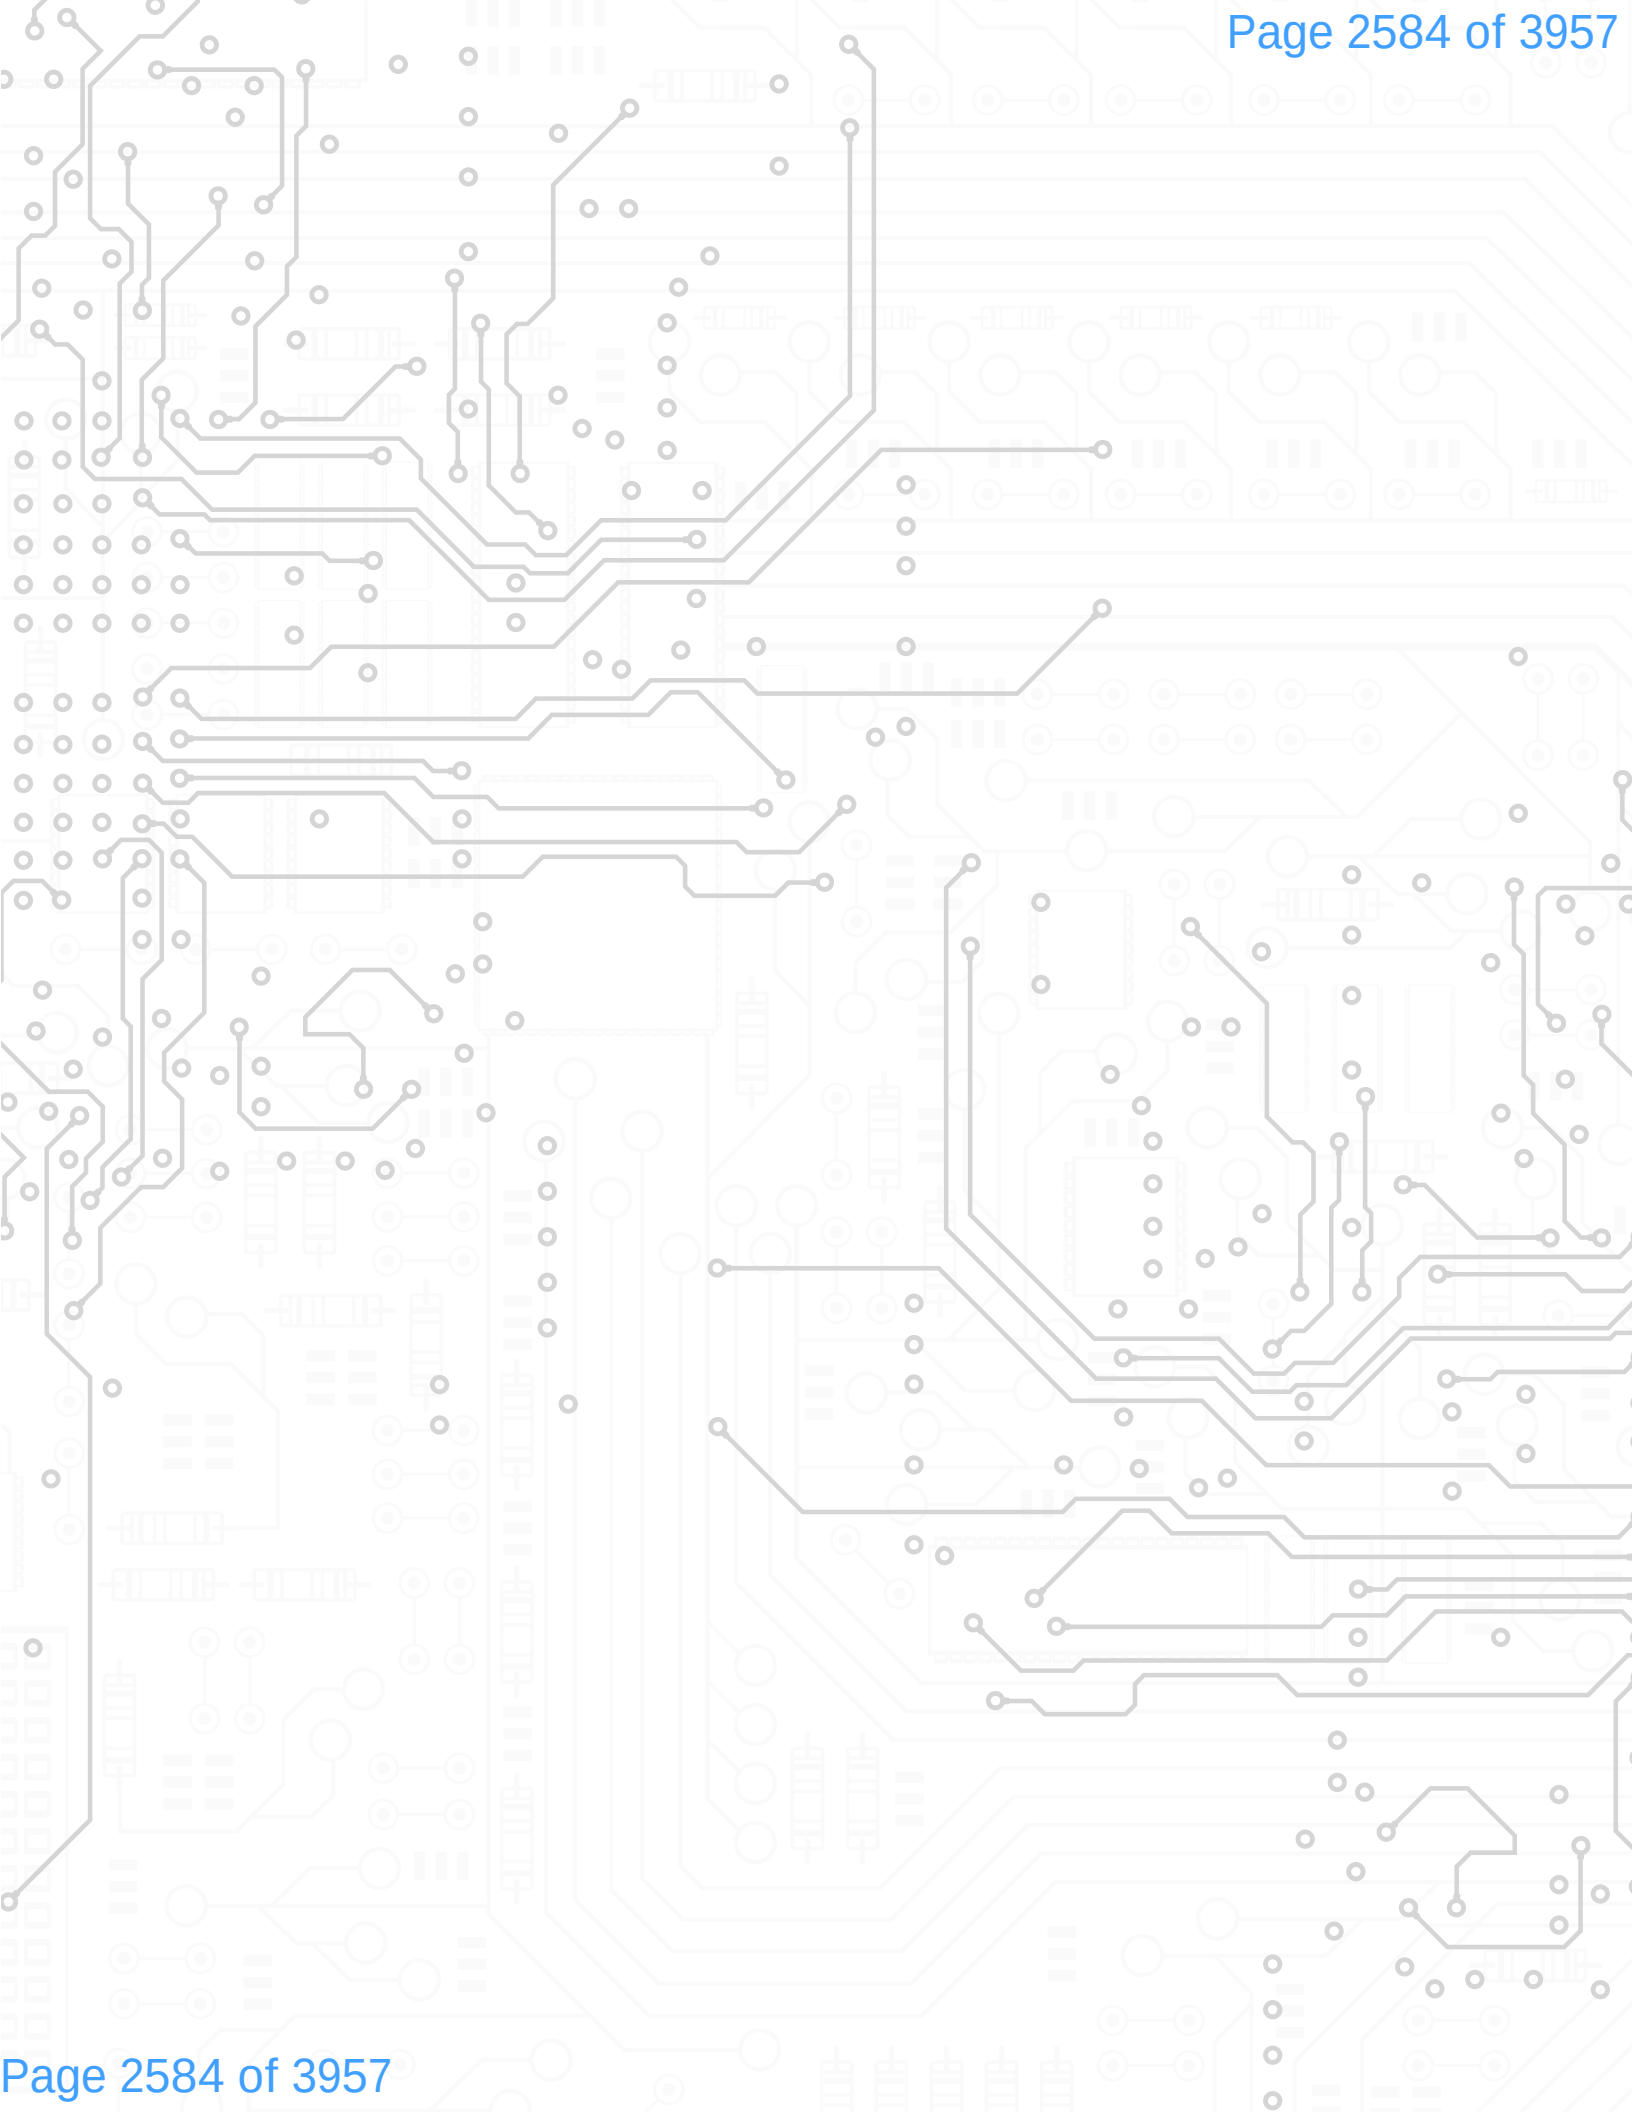
The U.S. Government (USG) continues to undertake numerous actions to counter economic espionage in cyberspace. Perhaps most evident are current USG efforts to protect critical infrastructure and other sensitive computer networks from malicious cyber activities. The USG also continues to work with the private sector to address science and technology gaps through cyber research and development as a way of mitigating the malicious activities of threat actors in cyberspace. The USG will continue to improve its efforts to disrupt, deny, exploit, or increase the costs of foreign cyber operations that are targeting the nation's most critical economic assets.

Examples of USG actions include the following:

- Sharing information about cyber threats, vulnerabilities, and other risks;
- Promoting best practices, risk assessments, and capability development;
- Improving our responses to cyber incidents;
- Building and driving the market towards a more secure cyber ecosystem; and
- Partnering with allies to address cyber issues.

The USG has the capability to impose costs on adversaries who engage in economic cyber espionage through various actions, including diplomatic, informational, military, law enforcement, and economic response. The details of many of these actions are too sensitive to discuss in this publication; however, we have provided a few general examples that illustrate the USG's response, such as:

- Public statements and attribution;
- Diplomatic demarches;
- Economic sanctions; and
- Law enforcement actions.



OFFICE OF THE DIRECTOR OF NATIONAL INTELLIGENCE

Neurosecurity: Human Brain Electro-optical Signals as MASINT

by Dr. Matthew Canham and Dr. Ben D. Sawyer

INTRODUCTION

Applied neuroscience presently allows not only the scientific discovery-oriented probing of the inner workings of the mind, but increasingly the probing of individual minds toward gathering intelligence. Significant advances in neuroimaging, leveraging both active and passive electro-optical energy, can reveal specifics of information held in the mind even without cooperation (e.g., Lange et al., 2018; Sawyer et al., 2016a). The processes of the brain increasingly join many other energetic sources from which quantitative and qualitative data analysis may extract identifying features and other useful intelligence (Sawyer & Canham, 2019). Indeed, it is increasingly appropriate to discuss the human brain as a system which can be read from, written to, and the operations of which may therefore be collected for analysis or influenced (Sawyer & Canham, 2019). Indeed, we argue here that we are witnessing the end of the era in which human thought is generally accepted as an entirely private process, the starting point of an unquestionably remarkable transition. The collection of unintended emissions and byproducts toward intelligence fits well into the mold of Measurement and Signals Intelligence, and indeed Measurement and Signature Intelligence (both MASINT, Macartney, 2001), and so we believe this community within the Intelligence Community is well-suited to discuss these new realities of neurosecurity, as it helped shape many formative discussions surrounding cybersecurity. A MASINT perspective on biological, neural signatures comes with the need to discuss current capabilities, projected technological arc, practicalities, and potential abuses.

While these authors currently have no knowledge of remote monitoring of brain activity, multiple commercial entities are working toward this technology (Strickland, 2017) in various forms. Simultaneously, evidence of remote interference in normal brain functioning is in the news. Most recently, between December 2016 and October 2017, at least 21 employees stationed at the U.S. Embassy in Havana, Cuba, reported experiencing a constellation of symptoms usually associated with a concussion or traumatic brain injury (TBI). Eighteen of these employees reported a sudden onset of symptoms coinciding with an intense chirping or ringing sound similar to the Indies short-tailed cricket. Symptoms reported by employees included difficulty hearing, dizziness, headaches, cognitive difficulties, difficulties with balance, and intense brain pressure (Kirk, 2019). A clinical evaluation by researchers at the University of Pennsylvania found structural differences between exposed employees and healthy controls (Verma et al., 2019). While the clinical implications of this are currently unclear, it seems plausible that these employees were exposed to something that altered their neurological structures and cognitive functioning. The mystery continued to deepen in 2018 when an embassy employee stationed in Guangzhou, China, reported similar symptoms. While we stress that there is still considerable mystery surrounding these events, it does seem likely that these symptoms were (1) induced and (2) likely not the direct goal of whatever process produced the phenomenon. Initial examination of the victims suggests remote microwave energy, long known to affect temporal lobe function (Dyer, 2018). These phenomena provide potential evidence of the intentional targeting of neural architecture, potentially as an attack, potentially as a side effect to some other goal.

Less circumspect evidence also exists. Capability to monitor neural activity exists given direct physical proximity, and remote neural monitoring may be feasible. Recent advances have seen remote detection of other biosignals once considered only measurable from direct physical proximity. For example, NASA's Finding Individuals for Disaster and Emergency Response (FINDER) system uses low-power microwaves to detect heartbeats at great physical range (Liu et al., 2014). Core body temperature is now routinely monitored in crowds to identify individuals with infections (Ng, Kawb, & Chang, 2004). Moreover, two categories of neuroimaging technology are emerging with the promise to make remote brain access a near-term reality. Industry groups like Facebook and Open Water are working to advance near-infrared and holographic techniques for monitoring neural blood flow patterns in real time (Open Water, 2018).

Page 2586 of 3957

Meanwhile, Neuralink, Kernel, and others are working to connect the electrical activity of the brain to intermediary electrodes, and then to the Internet. The success of either of these technologies, neuroimaging at range or Internet-connected electroencephalography, will open a new universe of possibilities for the realms of MASINT, SIGINT, and HUMINT alike.

CURRENT STATE OF THE ART

Before diving into the world of neuroimaging, we offer a brief introduction into what is currently known about how the brain functions. We begin with the neuron, the basic building block of the neural network that is our brain. A basic decision-making system, it takes in input from upstream neurons through receptors known as dendrites and, once a certain threshold of these signals is met, "fires" an action potential which travels down the long synapse to the synaptic gap which separates one neuron from another. Here, chemical signals take over, propagating further action potentials downstream to other neurons in spreading cascades of activity and activation. The process is a foundation for complex patterns of information being aggregated and processed. For example, while the earliest neurons to process visual information might only detect the presence or absence of an edge, neurons further downstream in visual cortex will aggregate the presence of an edge in a specific orientation or relative position and recognize this as the letter "K." Further downstream, neurons will respond more vigorously to the letter "K" when it is placed at the beginning of a word as opposed to the middle or end. In this way, information is aggregated and processed into meaningful coherence.

While there is still debate surrounding the validity of brain area specialization, and growing evidence for "network" approaches to understanding activity, at a coarse level, brain regions appear to be functionally specialized for different activities. Understanding this differential specialization allows for a limited, but growing, degree of reverse engineering of brain processes. A great deal of cognitive processing occurs in the neocortex, the outermost layer of the brain. Here, four "lobes," anatomical brain regions, have been linked by research to functional specializations (see Figure 1, Miller & Cummings, 2017). The occipital lobe, or visual cortex, is where much of visual processing takes place. The parietal lobe handles spatial awareness and somatosensory processes which feed the brain's sense of bodily positioning and stimulation. For example, tickling the hands or feet with a feather would activate somatosensory processing, which would occur primarily in the frontal parietal lobe. The temporal lobe also sits just forward of the occipital lobe and below the parietal lobe, usually just above one's ear. The temporal lobe (aka the auditory cortex) processes sound and often handles long-term memory processing as well. Finally, the frontal lobe is responsible for fine motor functioning, and actions known as executive functions: deliberate decision-making, inhibitory control, attention, and working memory. If you are intensely concentrating on a task, then there is a high likelihood that you are recruiting much of your frontal lobe's prefrontal cortex. This final example is especially significant from a MASINT perspective: it has been suggested that when deliberately trying to deceive someone, the deceiver relies on his/her frontal lobe to a greater degree than does someone who is not attempting to be deceptive (Zeki et al., 2004). There is greater activation in the prefrontal cortex because the individual must inhibit the true version events and must hold two versions active simultaneously (Ofen et al., 2016). Although there is still much debate on the validity of this assertion, as an example it illustrates how neural processing might be utilized in an intelligence-gathering capacity.

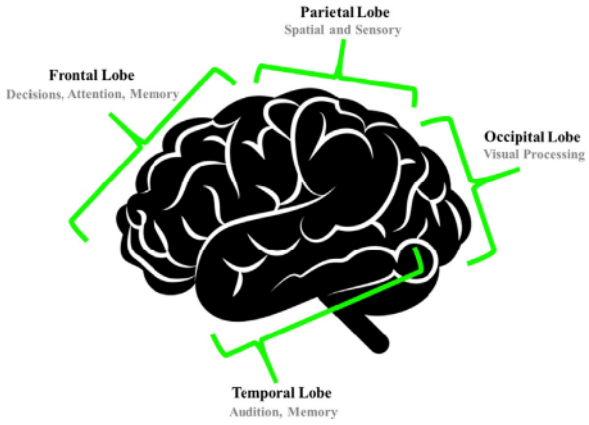


Figure 1: The neocortex or surface of the brain, disproportionately responsible for cognitive processing, is currently conceptualized as divided into functional regions. As with technical and social systems, useful MASINT consideration of these areas is in terms of intelligence and potential influence. Increasingly, it is possible to collect electro-optical energy emitted by the brain and, leveraging temporal and spatial dimensions, decode meaning and so acquire useful intelligence. Influence is also possible, and devices which project electrical force into the brain can disrupt or modify brain processes.

Detectable Signals – A discussion about neuro-imagining should first make the distinction between structural and functional imaging. Structural imaging provides a highly detailed static image of the neuro-

Page 2587 of 3957

anatomical structures of an individual. When the researchers from the University of Pennsylvania examined the embassy employees and found differences in whole brain white matter, this difference was found through the analysis of static structural images (Verma et al., 2019). In contrast, functional imagery tends to be coarser but provides a dynamic series of snapshots that provide insight into the neural activity of an individual. While both techniques have relevance to MASINT applications, functional imaging will be the topic of focus here. Within the universe of functional imaging there are currently two types of signals, blood flow and electrical activity, that are detected to derive neural functioning.

Blood Flow Signals – When neurons are active, these cells consume sugar and oxygen and therefore require replenishment. This replenishment transpires through a process known as hemodynamic response. Termed a blood-oxygen-level-dependent (BOLD) signal, this difference between oxygenated and deoxygenated blood is detectable through various means such as magnetic manipulation or using infrared spectrum light. Examining this signal using magnetism usually involves a technology known as functional Magnetic Resonance Imaging (fMRI). fMRI technology witnessed an upshot in usage within brain research beginning in the early 1990s because it was considerably less intrusive than comparable imaging technologies available at the time. A major drawback in fMRI as a MASINT technique is the need to immobilize a subject and capture imagery over a long time period (from 45 minutes to a few hours), while secured to a table and loaded into a magnetic resonance tube. Movement during imaging is highly detrimental, meaning that only extremely compliant individuals can be imaged. Finally, high tesla (a measurement of magnetism strength) equipment capable of high spatial and temporal resolution imaging is extremely expensive and often requires a dedicated staff, making this technology largely confined to use within a dedicated laboratory. These inconveniences notwithstanding, several researchers have proposed methods of employing fMRI as a means of deception detection (Ganis et al., 2003; Kozel et al., 2005; Monteleone et al., 2009; Ganis et al., 2011). Continuing advances in the miniaturization of this technology suggest this could eventually be an approach moved out of the laboratory and into the field (see, for example, Cooley et al., 2015).

Other emerging techniques such as functional Near Infrared Spectroscopy (fNIRS) offer a window into more near-term workable solutions. Cheap, low-power, and portable, fNIRS utilizes the near infrared spectrum light to detect the BOLD signal. In the 700-900nm spectral range, bodily tissues are mostly transparent, allowing maximal detectability of the relative difference between oxygenated and deoxygenated hemoglobin. fNIRS utilizes a combination of infrared light emitters and receivers to parse out the BOLD signal through differences in infrared light intensity. These differences in light intensity can then be interpreted to detect and localize BOLD signals from specific brain regions to infer localized activity. One of the major advantages of fNIRS over fMRI from a MASINT perspective is the ease of use, and portability of these devices. Indeed, the technology is routinely held up as an excellent match for the demands of brain machine interface and field research (respective reviews are Naseer & Hong, 2015 and Quaresima and Ferrari, 2019). It is currently unclear what the ultimate detectable range using the infrared spectrum will be, but at present these signals are detected using a sensor cap worn by the subject which directly contacts the skin. This portability and ease of use would potentially allow for modern deployment in the debriefing of HUMINT assets by handlers or operational psychologists.

Electrical Activity Signals – While neuroimaging techniques dependent upon blood flow offer high spatial resolution and the capability of localizing neural activity, they lack the capability of detecting activity with a high temporal resolution because there is an inherent lag in the reuptake of oxygenated hemoglobin into active neural regions. This delay means that events which happen very quickly, such as visual recognition, can be missed by techniques reliant on BOLD signal. In these situations, techniques that detect electrical activity offer an advantage over those that detect signals related to blood flow. Electrical detection techniques have very high temporal resolution (on the order of milliseconds), but because electrical fields are distorted by the scalp, they lack the spatial resolution that blood flow-based imaging techniques have. Therefore, researchers often combine these techniques when studying neuro phenomena.

Techniques measuring electrical activity include deep brain electrodes, Electrocorticography (ECoG), and Electroencephalography (EEG), listed from most to least invasive. Brain-contact techniques utilize small probes (approximately 5 im thick) to directly connect to neurons to detect activity (Muthuswamy, 2012), and involve opening the skull to access the cortex. ECoG is somewhat less invasive, involving electrodes that rest upon the dura, a thin sheet of enervated tissue which contains the cerebrospinal fluid and the brain. Non-invasive techniques such as EEG detect voltage potential fluctuations deriving from the action potential activity within the neurons of the brain. Such measured "potentials" can be measured longitudinally over time, or measured relative to specific events, an approach which can identify specific patterns of brain activity known as event-related potentials (ERP). This connection between

Page 2588 of 3957

outside events and brain activity is an excellent strategy to reverse engineer (to a limited degree) the brain activity as it relates to a specific stimulus. One of the most studied ERPs, the "P300" wave, is a distinctive positive fluctuation that occurs approximately 300 milliseconds after visual recognition of a stimulus. The P300 has therefore been proposed as a deception detection technique in "guilty knowledge tests." A subject wearing an EEG would, in such a test, be presented with visual stimuli in succession, and an amplified P300 of what occurred directly after any image recognized, and without the awareness or conscious control of the subject. Many other potentially useful ERPs exist, in the context of MASINT, and include error-related negativity (ERN, see Sawyer et al., 2016b), the P3 (see Rosenfeld et al., 1991), and ERN composite signals such as the multifaceted electroencephalographic response (MERMER, see Farwell & Smith, 2001), to name but a few. Indeed, while the present literature is focused upon individual signatures and their functional meeting, the overarching message here from a MASINT perspective is that electrical signals collected incidentally from brain activity can be used to provide actionable intelligence.

Directing Input into the Brain – Thus far our discussion has centered around reading activity from the brain, but electromagnetic energy can also be effectively used to input information into the brain. A delicate system, the brain can be influenced or disrupted by relatively small amounts of kinetic or electrical energy, and indeed is susceptible to informational patterns (Sawyer et al., 2016a; Sawyer & Hancock, 2018) Transcranial Magnetic Stimulation (TMS) is one such technology, and uses magnetic energy directed toward the neocortex either to excite or to suppress the underlying neural region. For example, an individual who has their visual cortex (occipital lobe, see Figure 1) may experience loss or aberration of vision. TMS has been used for decades in both clinical and research contexts. Recent applications of this technology are striking: for example, a research group at the University of Washington (Jiang et al., 2019) employed TMS as part of an "artificial telepathy" apparatus. In this experiment, two subjects (the senders) watched the orientation of Tetris-like pieces and focused on whether the piece should be rotated to align its placement. A third subject (the receiver), located in a different room and unable to see the pieces, was tasked with deciding whether to rotate the piece. The receiver performed well above chance (~81% accuracy) in deciding whether the piece needed to be rotated, based completely upon the signal he received from the senders. This suggests that beyond collecting actionable intelligence, there are presently ever-increasing opportunities for near engineering, potentially for influence or projecting force.

BRAIN MACHINE INTERFACES INTRODUCE NEW ATTACK SURFACES

Significant progress has been made in recent years in the development of both invasive and non-invasive Brain-Machine Interfaces (BMIs), allowing operators to communicate directly with machinery (computers, robotics, cars, artificial limbs, etc.) using only their thoughts (Roelfsema et al., 2018). A quick patent search reveals that over 3,800 patents were filed for such technology in 2018 (Google Patents, 2019). The intimate connection between the operator's brain and the controlled device opens an entirely new dimension of attack surfaces to be exploited by cyber threat actors. Information security primarily rests upon three pillars: Confidentiality (preventing unauthorized disclosure of information), Integrity (preventing unauthorized modification of information), and Availability (maintaining access to information), the so-called CIA Triangle (Wiley, 2008). Within the context of neuro-security a breach of Confidentiality could potentially allow unprecedented access to an individual's most private data, his/her thoughts. A breach of Integrity would mean that an attacker could inject commands into a neuro-device, or alternatively send false feedback to the brain from the device. A failure of Availability would prevent a user from being able to control the device or receive data from it. The failures of any of these pillars might seem to be purely within the realm of science fiction; however, proof of concept attacks have already been demonstrated for each.

Reaching into the uncooperative individual's mind to retrieve, or influence, information is increasingly a reality. Lange et al. (2018) were able to recover partial Personal Identification Numbers (PINs) from subjects' EEG (electroencephalogram) signal. Other research (Roelfsema et al., 2018) has demonstrated the ability to infer the words or concepts that an individual is thinking of, from EEG signals. Without the proper security, individuals using BMIs relying on similar signal processing would be subject to having their private thoughts exposed. Perhaps more disconcerting than breaching Confidentiality is a breach of Integrity; such a breach was demonstrated by Cusack et al., 2017 in a highly controlled environment. In this study, researchers conducted a Man-In-The-Middle attack against a BMI and a toy car and were able to intercept thought-based commands from the user's BMI and inject modified commands. In this case they substituted the command "turn left" with "turn right." If such an attack were launched against an artificial limb or a wheelchair (both of which can now be controlled with similar technology), an attacker could easily cause death or serious physical injury either the user or those around them. In a similar vein, Cusack et al. (2017) describe a simple modification to their integrity-focused attack of flooding the BMI connection with meaningless packets to disrupt the control channel and thereby deny the operator

Page 2589 of 3957

access to the controlled device. This type of attack, properly timed, could lead to equally destructive results if the downstream device is the artificial limb or wheelchair mentioned above.

FUTURE DIRECTIONS AND NEUROSECURITY CONCERNS

The current state of the art in neuroimaging requires that sensors be placed in very close proximity to a subject's cranium, a state of affairs that many other energetic MASINT sources once shared. Could technology be someday (or presently) capable of detecting neural signals from a distance? While the signal detection difficulties of such a system are great, it is within the realm of possibility. Even such a technology with very limited range would have serious implications for the Intelligence Community, and open the door to covert neuro-surveillance. A few inches might allow an apparatus to be embedded in surfaces, such as seating. A few meters would allow for neuro-surveillance of an interview at a border crossing. More range comes with more interesting, and concerning, implications.

What about individuals who choose to use technology to project their neural information outward? Neuralink, and other industry actors, have this possibility as a direct piece of their value proposition. The idea of computer network-connected brains mirrors that of other computer network-connected sensors: surveillance becomes implicit in return for convenience. Indeed, it may be useful to consider the fact that surveillance capabilities of a covert microphone and a present generation household smart speaker are functionally very little. Covert or overt monitoring of neural activity holds many parallel possibilities, and Biafra mentioned remote neuroimaging is joined by technologies which will intentionally transmit neural information over the Internet, or other networks. It is extremely likely that industry and state actors, in the absence of legislative restraint, will find reason and avenues to collect and leverage such data. The rights of individuals to their own personal neural information, when transported through computer networks, is likely in the process of being decided presently by society and the courts, as rights to personal electronic information are a likely precedent.

Input, as discussed above, is another fascinating dimension of networked neural implants. The ideas are not radical, and indeed Apple and Nucleus, manufacturer of cochlear implants, recently made iOS the operating system connecting to more human implants than any other. These technologies join other apps which can be used to connect to a variety of human implants. In cochlear implants, for example, the intended mode of input is digital audio signals: it is better to listen to your phone call when beamed directly to your implant them through a microphone facing the phone speaker. However, these devices offer opportunities for MASINT, and for influence. Indeed, just as personal information and computer networks can be used for both surveillance and influence, it may be possible to manipulate overtly or covertly a target through an active neural, sensory nerves, or peripheral nervous system connection.

Consider a concerted effort to expose a subject to positive or negative stimulation in response to specific actions. Such a campaign would certainly result in some level of conditioning. We can, for example, imagine creating incentives not to enter a geo-fenced location, or not to leave one. Threat actors with the goal of rendering a target ineffective in their current occupation might leverage a cochlear implant to arrange for painful, annoying, disturbing, or other negative stimulus to be inflicted whenever the target entered their office. They could also simply degrade the quality of the function of the device. Because cochlear implants connect to the Internet through iPhones, this could be accomplished through the malicious employment of code. Note that such an attack would leverage intelligence about use location from the phone, and use the same phone to send negative stimuli to the target through the cochlear implants. Of course, cochlear implants in the United States presently all have removable external units, and could simply be removed. Submitting to deafness in order to remove the stimuli a denial in its own right, it is worth considering that such a scheme would work on other implants, each with its own uncomfortable set of possibilities.

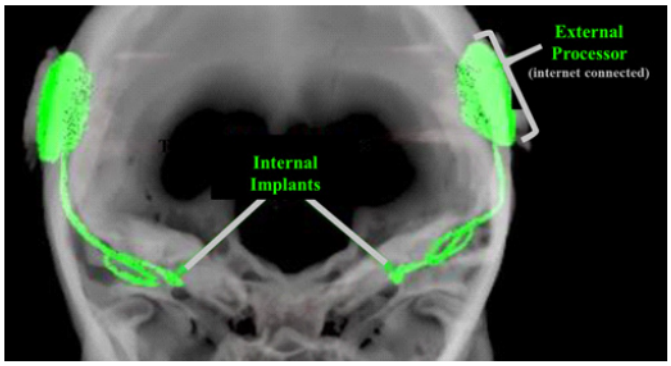

Figure 2: Modern cochlear implants are now compatible with Apple's iOS, which has therefore become a new and widely available attack surface for individuals with this type of sensory nerve-connected prosthesis. Neurosecurity questions exist regarding which central, sensory, or peripheral nervous system-connected devices will soon also be Internet-connected, and whether these have input or output capabilities.

The implications of direct and potential remote neuroimaging are, course, not limited to intelligence, nor to influence, nor to negative outcomes. Neuroimaging, especially remotely,

Page 2590 of 3957

might prove a particularly robust new form of biometrics, through the recording of an individual's neural responses to specific stimuli, using amenable ERPs, for example. The possibilities for industry, health, and human computer interface are monumental. Interpersonal communication might be revolutionized, or at least improved. However, we believe that this hopeful narrative must be tempered with understanding of the implications to individual and aggregate security. Major questions exist, and at present there are no answers.

OPEN QUESTIONS AND CONCERNS SURROUNDING NEUROIMAGING AS A MASINT SOURCE

In sum, applied neuroscience techniques previously reserved for experts probing scientific questions are now increasingly amenable to MASINT. There are presently multiple scenarios in which intelligence can be gathered through passive monitoring of the electro-optical signals concurrent with brain activity (blood flow and neural discharge patterns), and in the near future such access may become available at greater physical distance. These opportunities are joined by rapid advancements in understanding of the functional organization and temporal signaling of the brain, coupled with rapid advancement in occupational power and machine learning technique quite familiar to the MASINT community. The result is the beginning of an era in which neural information, and the machinations of the human brain, are joining many other systems previously made amenable to MASINT information-gathering approaches. Indeed, the impacts of these combined advances are undoubtedly fueling scattered conversation and innovation in the public and classified spheres of many countries. While some outcomes will be undeniably positive, we feel that there are strong signs that a more focused conversation needs to be held.

Recently, several U.S. embassy workers stationed at Guangzhou, China, have reported symptoms like those reported by U.S. embassy workers stationed in Cuba. Again, there is much controversy surrounding these reports. One widely held assumption is that these are in fact the result of some type of "neuro-attack." Perplexing problems now arise. How could such an attack be detected? Every time your brain forms a new memory (which happens constantly), your brain changes in subtle and poorly understood ways. This constant change makes baselining incredibly challenging, and there remains some question as to whether this is even possible. Moreover, it seems likely that an "input"-based technology, as may be the cause, would be infinitely more detectable than a technology monitoring output. It seems evident that neuroimaging technology holds great potential for MASINT, and for this reason alone there is the likelihood that state-sponsored intelligence services will attempt to employ this technology as an intelligence-gathering technique. The high likelihood of this experimentation, and the relatively feasible nature of creating such a technology, should compel more research to be conducted on a variety of related neurosecurity topics.

It seems evident that neuroimaging technology holds great potential for MASINT, and for this reason alone there is the likelihood that state-sponsored intelligence services will attempt to employ this technology as an intelligence-gathering technique.

Beyond the fundamental question of whether neural tissue is amenable to gathering intelligence, or a likely target for projecting force, fundamental forensic questions which should be addressed by such a line of research are as follows:

How do we ensure neurosecurity? Just as cybersecurity was once poorly understood, so now is neurosecurity. We must understand which approaches are real threats, what their limitations are, and develop understanding as to how our own state, industry, and greater public population can be protected. We must also begin a dialogue in scientific, legislative, and public spheres to address how best to integrate these coming realities into our society. How do we safeguard freedom and security when the information between our ears is no longer inherently our own?

How do we detect attacks? In terms of information-gathering attacks, neurosecurity is likely to suffer from many of the same challenges as cybersecurity; by definition, a well-executed attack need leave no trace (see Hancock, Hancock & Sawyer, 2015). In terms of influence, the more difficult question is one of trust. What is possible in terms of influence, and how can we detect it? Indeed, this is the challenge of cyber-compromised computer systems which serve new masters, or have their cycles turned toward threat actor goals. How do we know when an individual has been attacked? One of the greatest challenges in the "Havana Syndrome" has been establishing whether something in fact occurred. Subjectively, patient reports align very closely (sudden onset, hearing a high-pitched chirping or ringing, difficulty concentrating and maintaining balance), but there is thus far no way to establish exposure conclusively.

Is it possible to develop a baseline? In cybersecurity, understanding of the original state of the system is vital for understanding whether an intrusion has occurred, and how the system is compromised. If a method for detecting a

Page 2591 of 3957

neuroattack is developed, it will likely involve establishing an analogous neural baselining. The clinical evaluation of Havana Syndrome victims by researchers at the University of Pennsylvania found structural differences between exposed employees and healthy controls. Specifically, structural imaging indicated significantly decreased levels of whole brain white matter, differences in regional gray and white matter volumes, cerebellar microstructural integrity, and functional connectivity in the visuospatial and auditory subnetworks (Verma et al., 2019). While this study found differences between the exposed population and healthy controls, it was unable to demonstrate differences within patients before and after the time of exposure because there was no baseline created prior to their deployment. Another limitation of this study was that it focused on the structural aspects of the patients' neural architectures, but not their cognitive functioning. Baselining to detect a neuro-attack will likely necessitate a cognitive functioning component, perhaps involving rapid response to various stimuli. Developing a baseline of cognitive functioning will likely utilize neuroimaging, for example EEG to measure patient responses to stimuli over time. One of the greatest challenges to this will be understanding whether such baselining is even possible. The brain is incredibly plastic and changes constantly. In fact, every new memory formed causes changes within the brain. An unanswered question is what does "normal" change look like compared to "abnormal" change, and can these differences be detected? If they can be detected, is EEG the right technique, and are EEG responses to stimuli consistent over time? The few answers that presently exist come from vastly different domains in the neurosecurity threat to come.

CONCLUSION: TOWARD A MASINT UNDERSTANDING OF THE BRAIN

MASINT has existed for long enough that the community has witnessed many energetic signals moving from non-useful to pivotal. We here predict that the energetic emissions of the human brain will follow that pattern. Understanding the time frame of that change is difficult. It may take the entirety of our coming careers. It may have already happened. The cause of the Havana Syndrome remains a mystery at the time of this writing. It is also unclear whether Havana Syndrome is specifically the result of a neuro-weapon, or something entirely different. It does, however, provide the opportunity for a timely thought experiment, as the world will witness the effects of neuro-weapons in the foreseeable future. It is critical that tools and techniques be developed to detect the effects of these weapons, and to guard against them. We believe that the framework of MASINT, and the broader Intelligence Community which has such implicit interest in these ongoing developments, is an excellent place to begin this critical work.

Dr. Matthew Canham, a psychologist and neuroscientist, is Research Professor of Cybersecurity for the Institute of Simulation and Training at the University of Central Florida in Orlando. His PhD degree in Cognition, Perception, and Cognitive Neuroscience is from the University of California, Santa Barbara. His research focuses on the human aspects of privacy and cybersecurity. Previously, Dr. Canham was a Supervisory Special Agent with the FBI, where he served in the field performing investigations of cyber-breaches, intellectual property theft, and other federal violations. Later, as manager of the Emerging Technologies Program with the Operational Technology Division based in Quantico, VA, he co-authored the FBI briefing for the incoming U.S. Presidential Cabinet on "Technology Based Threats to Law Enforcement in the 21st Century" and provided subject matter expertise to the FBI's Cyber Behavioral Analysis.

Dr. Ben D. Sawyer is Assistant Professor within Industrial Engineering and Management Systems at the University of Central Florida, and Director of the Laboratory for Autonomy-Brain Exchange (LabX). His PhD degree in Applied Experimental Psychology and MS in Industrial Engineering are from the University of Central Florida. At the Massachusetts Institute of Technology, he leveraged biosignals, big data, and machine learning to engineer models of human performance and behavior for the use of machine counterparts. At the Air Force Research Laboratory 711th Human Performance Wing's Applied Neuroscience and BATMAN Divisions, he built mathematical models of human performance for special operations, including cyber operations. His present research, and laboratory, seek to accelerate information transfer between human and autonomy. Dr. Sawyer's design recommendations are leveraged by Fortune 500 companies. His work has been covered by Forbes, *Reuters, Fast Company, and the BBC, and published in leading scientific journals.*

PRESS RELEASE

Former U.S. Military Pilot Admits Acting as Paid Agent of China and Lying on National Security Background Forms

Thursday, June 23, 2022

Share

For Immediate Release
Office of Public Affairs

A former U.S. Army helicopter pilot-turned-civilian-contractor pleaded guilty in federal court today, admitting that he acted as an unregistered agent of China and accepted thousands of dollars from representatives of the Chinese government to provide aviation-related information from his defense-contractor employers. He also pleaded guilty to making related false statements during national security background checks.

Shapour Moinian, 67, of San Diego, served in the Army in the United States, Germany, and South Korea from approximately 1977 through 2000. After his service, Moinian worked for various cleared defense contractors in the United States – including in San Diego – as well as the Department of Defense. "Cleared" is a term that indicates a contractor is permitted to work on projects that involve classified information.

According to his plea agreement, while Moinian was working for a cleared defense contractor, or CDC, on various aviation projects used by the U.S. military and U.S. intelligence agencies, he was contacted by an individual in China who claimed to be working for a technical recruiting company. This person offered Moinian the opportunity to consult for the aviation industry in China.

"Moinian was a paid agent of the Chinese government who sold American aviation-related technology," said Assistant Attorney General Matthew G. Olsen of the Justice Department's National Security Division. "The Department of Justice has no tolerance for those who help foreign governments break the law to undermine American competitiveness and innovation."

"This defendant took the aviation materials of his American employers and sold them to China," said U.S. Attorney Randy Grossman for the Southern District of California. "This conduct was an outrageous breach of trust by a former member of the U.S. military. The United States will aggressively investigate and prosecute anyone who works at the direction of foreign governments to steal American technology and intellectual property."

"The People's Republic of China remains determined to acquire our information and technology. In this case, we witnessed a former U.S. Government employee acting as an agent of the government of China and Chinese intelligence officers' extensive use of social media to identify willing targets," said Assistant Director Alan E. Kohler Jr. of the FBI's of the Counterintelligence Division. "The FBI is committed not only to leveraging risk and consequences upon the defendant, but also to confronting the behavior and policies of the Chinese government that threaten our national security and freedom."

"The defendant admitted to being an unregistered agent of a foreign power, lying on his background check paperwork to obtain his security clearance, knowingly providing proprietary information to people controlled by the Chinese government, and willingly receiving payments from them. This is another example of how the Chinese government enhances its defense capabilities through the illicit exploitation of U.S. technology," said Special Agent in Charge Stacey Moy of the FBI's San Diego Field Office. "When someone holds a security clearance, they know what information should be reported to security officials. In this case, the defendant betrayed his sacred oath, knew his actions were wrong, and subsequently lied about it. The FBI and our partners on the Counterintelligence Task Force will pursue anyone who abuses their placement and access to obtain proprietary information on behalf of a foreign government. I specifically want to thank the Naval Criminal Investigative Service (NCIS) for their continued partnership on this case."

"Mr. Moinian sold information to the Chinese government, and lied repeatedly to cover up his crimes," said Special Agent in Charge Michelle Kramer of the NCIS Office of Special Projects. "Now he is being held to account for his actions. NCIS and our partners remain unwavering in our commitment to protecting the U.S. military and rooting out criminality that threatens the superiority of the U.S. warfighter."

In March of 2017, Moinian travelled to Hong Kong where he met with this purported recruiter and agreed to provide information and materials related to multiple types of aircraft designed and/or manufactured in the United States in exchange for money. Moinian accepted approximately $7,000-$10,000 in United States currency during that meeting. According to his plea agreement, at this meeting and at all subsequent meetings, Moinian knew that these individuals were employed by or directed by the government of the People's Republic of China.

Upon returning to the United States, Moinian began gathering aviation-related materials, which included transferring material from a CDC to a thumb drive. In September 2017, the defendant traveled overseas and, during a stopover at the Shanghai airport, met with Chinese government officials and provided aviation-related materials on a thumb drive, including proprietary information from a CDC. Thereafter, Moinian arranged for payment for this information through the South Korean bank account of his stepdaughter. Moinian told his stepdaughter that these funds were payment for his consulting work overseas and instructed her to transfer the funds to him in multiple transactions.

Moinian also received a cell phone and other equipment from these individuals to communicate with them and aid in the electronic transfer of materials and information.

At the end of March 2018, Moinian traveled to Bali and met with these same individuals again. Later that year, he began working at another CDC. During this timeframe, the same individuals in China transferred thousands of dollars into the South Korean bank account of Moinian's stepdaughter, who subsequently wired the funds to Moinian in multiple transactions.

In August 2019, Moinian traveled again to Hong Kong and met with these same individuals where he was again paid approximately $22,000 in cash for his services. Moinian and his wife smuggled this cash back into the United States.

According to his plea agreement, Moinian also admitted that he lied on his government background questionnaires in July 2017 and March 2020, when he falsely stated that did not have any close or continuing contacts with foreign nationals and that no foreign national had offered him a job.

At sentencing, Moinian faces a maximum penalty of 10 years in prison and fine up to $250,000 for acting as an agent of a foreign government, and up to five years and a $250,000 fine for the false statements count. Sentencing is scheduled for Aug. 29.

This case was investigated by the FBI and the NCIS and is being prosecuted by the U.S. Attorney's Office for the Southern District of California and the Department of Justice's National Security Division.

PRESS RELEASE

Maryland Nuclear Engineer and Wife Sentenced for Espionage-Related Offenses

Wednesday, November 9, 2022

Share

For Immediate Release
Office of Public Affairs

A Maryland man and his wife were sentenced today for conspiracy to communicate Restricted Data related to the design of nuclear-powered warships.

Jonathan Toebbe, 44, of Annapolis, was sentenced today to 232 months, over 19 years, of incarceration. His wife, Diana Toebbe, 46, was sentenced to 262 months, more than 21 years, of incarceration. The Toebbes pleaded guilty to the conspiracy in August 2022.

"The Toebbes conspired to sell restricted defense information that would place the lives of our men and women in uniform and the security of the United States at risk," said Assistant Attorney General Matthew G. Olsen of the Justice Department's National Security Division. "The Department of Justice remains committed to protecting U.S. defense technology."

"If not for the remarkable efforts of FBI agents, the sensitive data stolen by Mr. Toebbe could have ended up in the hands of an adversary of the United States and put the safety of our military and our nation at risk," said U.S. Attorney William J. Ihlenfeld II for the Northern District of West Virginia. "The FBI keeps American citizens safe from enemies both foreign and domestic and this case is an excellent reminder of their important work."

"These actions are a betrayal of trust, not only to the U.S. Government, but also to the American people," said Assistant Director Alan E. Kohler Jr. of the FBI's Counterintelligence Division. "All U.S. Government employees swear to support and defend the Constitution of the United States, and with that oath comes the obligation to protect sensitive information. Those entrusted with such grave responsibility must be held accountable if they violate their oath and betray their country. The investigation which led to today's sentencing is a reminder that the FBI and our partners will continue to doggedly pursue those who betray their sworn oath and those who aid them."

"The Toebbes were willing to compromise the security of the nation by selling information related to naval nuclear propulsion systems, they are now being held accountable for their actions," said Special Agent in Charge Mike Nordwall of the FBI Pittsburgh Field Office. "The FBI and our federal partners have an unwavering commitment to protect U.S. secrets and will continue to aggressively investigate and expose espionage activities conducted on U.S. soil."

"Naval nuclear engineer Jonathan Toebbe was entrusted with our nation's critical secrets and, along with his wife Diana Toebbe, put the security of our country at risk for financial gain," said U.S. Attorney Cindy Chung for the Western District of Pennsylvania. "Their serious criminal conduct betrayed and endangered the Department of the Navy's loyal and selfless service members. The seriousness of the offense in this case cannot be overstated."

"The Toebbes betrayed the American people and put our national security at significant risk when they selfishly attempted to sell highly sensitive information related to nuclear-powered warships for their own financial benefit," said Special Agent in Charge Brice Miller of the Naval Criminal Investigative Service (NCIS) Office of Special Projects. "As the law enforcement arm of the Department of the Navy responsible for preventing terrorism, reducing crime, and protecting secrets, NCIS remains committed to protecting vital information and technology that ensures the superiority of the U.S. Navy and Marine Corps."

According to court documents, at the time of his arrest, Jonathan Toebbe was an employee of the Department of the Navy who served as a nuclear engineer and was assigned to the Naval Nuclear Propulsion Program, also known as Naval Reactors. He held an active national security clearance through the Department of Defense, giving him access to "Restricted Data" within the meaning of the Atomic Energy Act. Restricted Data concerns design, manufacture or utilization of atomic weapons, or production of Special Nuclear Material (SNM), or use of SNM in the production of energy – such as naval reactors. Jonathan Toebbe worked with and had access to information concerning naval nuclear propulsion including information related to military sensitive design elements, operating parameters and performance characteristics of the reactors for nuclear powered warships.

According to court documents, Jonathan Toebbe sent a package to a foreign government, listing a return address in Pittsburgh, Pennsylvania, containing a sample of Restricted Data and instructions for establishing a covert relationship to purchase additional Restricted Data. Jonathan Toebbe began corresponding via encrypted email with an individual whom he believed to be a representative of the foreign government. The individual was really an undercover FBI agent. Jonathan Toebbe continued this correspondence for several months, which led to an agreement to sell Restricted Data in exchange for thousands of dollars in cryptocurrency.

On June 8, 2021, the undercover agent sent $10,000 in cryptocurrency to Jonathan Toebbe as "good faith" payment. Shortly afterwards, on June 26, Jonathan Toebbe serviced a dead drop by placing an SD card, which was concealed within half a peanut butter sandwich and contained military sensitive design elements relating to submarine nuclear reactors, at a pre-arranged location. After retrieving the SD card, the undercover agent sent Jonathan Toebbe a $20,000 cryptocurrency payment. In return, Jonathan Toebbe emailed the undercover agent a decryption key for the SD Card. A review of the SD card revealed that it contained Restricted Data related to submarine nuclear reactors. On Aug. 28, 2021, Jonathan Toebbe made another "dead drop" of an SD card in eastern Virginia, this time concealing the card in a chewing gum package. After making a payment to Jonathan Toebbe of $70,000 in cryptocurrency, the FBI received a decryption key for the card. It, too, contained Restricted Data related to submarine nuclear reactors. The FBI arrested Jonathan Toebbe and his wife on Oct. 9, 2021 after he placed yet another SD card at a pre-arranged "dead drop" at a second location in West Virginia.

The FBI and NCIS are investigating the case.

Trial Attorneys Matthew J. McKenzie and S. Derek Shugert of the National Security Division's Counterintelligence and Export Control Section, Assistant U.S. Attorneys Jarod J. Douglas and Lara Omps-Botteicher for the Northern District of West Virginia and Special Assistant U.S. Attorney Jessica Lieber Smolar for the Western District of Pennsylvania prosecuted the case.

IT Help Desk Technician Charged with Transferring Classified Materials to a Foreign Government

A U.S. government contractor was arrested on Aug. 24 based on espionage charges in a complaint unsealed today. Abraham Teklu Lemma, 50, a naturalized U.S. citizen of Ethiopian descent, of Silver Spring, Maryland, is charged with delivering national defense information to aid a foreign government, conspiracy to deliver national defense information to aid a foreign government, and the willful retention of national defense information.

According to the criminal complaint, between on or about Dec. 19, 2022, and Aug. 7, 2023, Lemma copied classified information from intelligence reports and deleted the classification markings from them. Lemma then removed the information, which was classified as SECRET and TOP SECRET, from secure facilities at the Department of State. This material related to a specific country and/or geographic region. Lemma accessed, copied, removed, and retained this information without authorization.

According to the charging documents, Lemma used an encrypted application to transmit classified national defense information to a foreign government official associated with a foreign country's intelligence service. In these communications, Lemma expressed an interest and willingness to assist the foreign government official by providing information. In one communication, the foreign official stated, "[i]t's time to continue ur support." Lemma responded, "Roger that!" In other chats, the foreign official tasked Lemma to focus on information related to particular subjects, and Lemma responded "[a]bsolutely, I have been focusing on that all this week . . . ." As alleged in the criminal complaint, the classified national defense information Lemma transferred to the foreign official included satellite imagery and other information regarding military activities in the foreign country and region.

The two espionage charges carry a potential penalty of death or any term of years up to life in prison, and the willful retention charge carries a maximum penalty of 10 years in prison. A federal judge will determine any sentence based on the U.S. Sentencing Guidelines and other statutory factors.

The FBI's Washington Field Office, the State Department's Diplomatic Security Service, and the Justice Department's Office of the Inspector General are investigating the case.

Assistant U.S. Attorneys Tejpal Chawla and Alexandra Hughes for the District of Columbia and Trial Attorneys Heather Schmidt and Kathryn DeMarco of the National Security Division's Counterintelligence and Export Control Section are prosecuting the case.

A criminal complaint is merely an allegation. All defendants are presumed innocent until proven guilty beyond a reasonable doubt in a court of law.

PRESS RELEASE

U.S. Navy Sailor Sentenced to 27 Months in Prison for Transmitting Sensitive U.S. Military Information to Chinese Intelligence

Monday, January 8, 2024

Share

For Immediate Release
Office of Public Affairs

A U.S. Navy service member was sentenced today to 27 months in prison and ordered to pay a $5,500 fine for transmitting sensitive U.S. military information to an intelligence officer from the People's Republic of China (PRC) in exchange for bribery payments.

According to court documents, Petty Officer Wenheng Zhao, 26, aka Thomas Zhao, of Monterey Park, California, pleaded guilty in October 2023 to one count of conspiring with the intelligence officer and one count of receiving a bribe.

"Mr. Zhao betrayed his solemn oath to defend his country and endangered those who serve in the U.S. military," said Assistant Attorney General Matthew G. Olsen of the Justice Department's National Security Division. "Today, he is being held to account for those crimes. The Justice Department is committed to combatting the Chinese government's efforts to undermine our nation's security and holding accountable those who violate our laws as part of those efforts."

"Zhao betrayed his country and disgraced himself when he accepted bribes from an intelligence officer with the People's Republic of China," said U.S. Attorney Martin Estrada for the Central District of California. "As a result, he has now been removed from the military and will serve time in federal prison. Today's sentence shows that my office will swiftly act to root out and punish those who seek to undermine our nation's security."

"Make no mistake, the PRC is engaged in an aggressive effort to undermine the national security of the U.S. and its partners," said Executive Assistant Director Larissa L. Knapp of the FBI's National Security Branch. "Zhao chose to betray the oath he took to our country and put others at risk by providing sensitive U.S. information to a PRC intelligence official. The Chinese Communist Party has repeatedly shown it will freely break any law or norm to achieve a perceived intelligence advantage. Today's sentencing demonstrates, yet again, the inability of China's Intelligence Services to prevent the FBI and our vital partners from apprehending and prosecuting the spies China recruits."

"Mr. Zhao betrayed his oath to the United States and deserves to be held fully accountable for accepting bribes in exchange for transmitting sensitive U.S. military information to an intelligence officer from the People's Republic of China," said Acting Special Agent in Charge Angel Cruz of the Naval Criminal Investigative Service (NCIS) Office of Special Projects. "NCIS will continue to leverage its unique law enforcement and counterintelligence authorities to vigorously pursue those who attempt to compromise our national security information. We are grateful to the FBI and Department of Justice for their substantial assistance to this lengthy investigation and greatly appreciate our continued partnership."

Zhao, who worked at Naval Base Ventura County in Port Hueneme and held a U.S. security clearance, engaged in a corrupt scheme to collect and transmit sensitive U.S. military information to the intelligence officer in violation of his official duties.

Between August 2021 and at least May 2023, Zhao received at least $14,866 in at least 14 separate bribe payments from the intelligence officer. In exchange for the illicit payments, Zhao secretly collected and transmitted to the intelligence officer sensitive, non-public information regarding U.S. Navy operational security, military trainings and exercises, and critical infrastructure. Zhao entered restricted military and naval installations to collect and record this information.

Zhao transmitted plans for a large-scale maritime training exercise in the Pacific theatre, operational orders and electrical diagrams and blueprints for a Ground/Air Task Oriented Radar system located in Okinawa, Japan.

He used sophisticated encrypted communication methods to transmit the information. He also destroyed evidence and concealed his relationship with the intelligence officer. Zhao's conduct violated his official duties to protect such information and the oath he swore to protect the United States.

The FBI Los Angeles Field Office's Counterintelligence and Cyber Division and NCIS conducted the investigation. IRS-Criminal Investigation provided substantial assistance.

Assistant U.S. Attorneys Annamartine Salick, Sarah Gerdes, Christine Ro and Kathrynne Seiden for the Central District of California prosecuted the case. Assistant U.S. Attorney Ryan Waters for the Central District of California and Trial Attorney Adam Barry of the National Security Division's Counterintelligence and Export Control Section provided valuable assistance.

PRESS RELEASE

U.S. Navy Service Member Pleads Guilty to Transmitting Sensitive U.S. Military Information to Chinese Intelligence Officer

Tuesday, October 10, 2023

Share

For Immediate Release
Office of Public Affairs

A U.S. Navy service member pleaded guilty today to federal felony offenses and admitted he transmitted sensitive U.S. military information to an intelligence officer from the People's Republic of China (PRC) in exchange for bribery payments.

Petty Officer Wenheng Zhao, 26, aka Thomas Zhao, of Monterey Park, California, pleaded guilty to conspiring with the intelligence officer and receiving a bribe.

Zhao, who worked at Naval Base Ventura County in Port Hueneme and held a U.S. security clearance, admitted he engaged in a corrupt scheme to collect and transmit sensitive U.S. military information to the intelligence officer in violation of his official duties.

"The intelligence services of the People's Republic of China actively target clearance holders across the military, seeking to entice them with money to provide sensitive government information," said Assistant Attorney General for National Security Matthew G. Olsen. "When contacted by his co-conspirator, rather than reporting it to the Navy, the defendant chose greed over protecting the national security of the United States. He is now being held accountable for his crimes. To others tempted to put personal profit ahead of patriotic duty, know that we are committed to identifying you and bringing you to justice."

"Protecting our country's national security is of the utmost importance," said Executive Assistant Director Larissa L. Knapp of the FBI's National Security Branch. "Zhao's guilty plea is an acknowledgement of the betrayal in selling sensitive military information to the Government of China. The FBI reminds all government officials to remain vigilant in reporting potential recruitment efforts by foreign actors, and we remain committed to standing with our partners to protect the U.S. from threats to our national security."

Between August 2021 and at least May 2023, Zhao admitted receiving at least $14,866 in at least 14 separate bribes from the intelligence officer. In exchange for the illicit payments, Zhao surreptitiously collected and transmitted to the intelligence officer sensitive, non-public information regarding U.S. Navy operational security, military trainings and exercises and critical infrastructure. Zhao admitted he entered restricted military and naval installations to collect and record this information.

Zhao specifically admitted to transmitting plans for a large-scale maritime training exercise in the Pacific theatre, operational orders, and electrical diagrams and blueprints for a Ground/Air Task Oriented Radar system located in Okinawa, Japan.

Zhao further admitted to using sophisticated encrypted communication methods to transmit the information, destroying evidence and concealing his relationship with the intelligence officer. Zhao's conduct violated his official duties to protect such information and the oath he swore to protect the United States.

"Officer Zhao betrayed his country and the men and women of the U.S. Navy by accepting bribes from a foreign adversary," said U.S. Attorney Martin Estrada for the Central District of California. "While he and the PRC officer he served took great pains to conceal their corrupt scheme, investigators were vigilant in uncovering this shameful plot. Today's resolution, requiring Zhao to plead guilty to all charges against him, shows that we will act swiftly and decisively to protect our nation from those who seek to undermine our security."

"The Naval Criminal Investigative Service (NCIS) would like to once again thank our partners at the FBI and Department of Justice for their continued assistance in bringing this case to a quick resolution," said Acting Special Agent in Charge Angel Cruz of the NCIS Office of Special Projects. "The swift action by the Department of Justice in prosecuting this case should serve as a warning to anyone who attempt to compromise the Department of the Navy's sensitive information or the security of our warfighters. If you or someone you know has knowledge of a potential compromise of sensitive military information, please contact your nearest NCIS or FBI office."

Zhao pleaded guilty before U.S. District Judge R. Gary Klausner. Sentencing is scheduled for Jan. 8, 2024. As a result of today's guilty plea, Zhao faces a statutory maximum penalty of 20 years in prison - five years for the conspiracy count and 15 years for the bribery charge. Zhao has been in custody since his arrest on Aug. 3.

The FBI Los Angeles Field Office's Counterintelligence and Cyber Division and NCIS conducted the investigation. IRS-Criminal Investigation provided substantial assistance.

Assistant U.S. Attorneys Annamartine Salick, Sarah Gerdes, Christine Ro and Kathrynne Seiden for the Central District of California and Trial Attorney Adam Barry of the National Security Division's Counterintelligence and Export Control Section are prosecuting the case, with assistance from Ryan Waters of the Asset Forfeiture Section.

This study examines the theory and application of psychological operations (PSYOP), with particular emphasis on contemporary military applications. Substantial historical and theoretical background is supplied, with detailed analysis of case studies. Current PSYOP applications by the United States and the Soviet Union are emphasized and include descriptions of their respective PSYOP capabilities, organizations, and goals.

6. ENDNOTES

1. INTRODUCTION AND DEFINITIONS

"To subdue the enemy without fighting is the acme of skill."--
Sun Tzu, 4th century B.C.

Psychological operations, or PSYOP, is a form of political and military activity that is understood and defined in a number of different ways. The definition upon which current peacetime U.S. PSYOP policy is based was established in Department of Defense Directive S-3321.1, Overt Psychological Operations Conducted by the Military Services in Peacetime and in Contingencies Short of Declared War (1984). That definition states that Psychological Operations are "planned political, economic, military, and ideological activities directed toward foreign countries, organizations, and individuals in order to create emotions, attitudes, understandings, beliefs, or behavior favorable to the achievement of U.S. political and military objectives." The DoD directive was formulated to establish standard guidelines for all aspects of PSYOP (planning, programming, execution, control) conducted by agencies of the U.S. Department of Defense in non-wartime conditions. But PSYOP also includes a number of other activities that fall under strategic military and political policy. Activities of that type are defined in Joint Chiefs of Staff Publication 1 as: "planned psychological activities in peace and war, which normally pursue objectives to gain the support and cooperation of friendly and neutral countries and to reduce the will and the capacity of hostile or potentially hostile countries to wage war." The latter definition reflects the expansion in scope that has occurred in PSYOP in the last fifty years. In the modern world, the scope of PSYOP is wider than ever

Page 2605 of 3957

before, even though the basic concepts continue as they have existed for thousands of years. Reflecting this expansion, PSYOP expert Fred W. Walker notes, "We might consider the term persuasive communications to mean the same thing as psychological operations."[1] Another expert, William Daugherty, prescribes an even broader field: "PSYOP is communication and therefore covers the entire field of human action."[2] In the present political-military meaning of the term, PSYOP is a multi-stage process that uses a combination of non-coercive devices to gain influence over the actions and attitudes of a targeted group without resorting to the use of force. The first stage of the process is defining the target, the second is finding methods or agents to influence the target's perception of reality, and the third is the output of the message through selected channels. In this process, the most critical element is credibility--to retain the attention of the audience, the audience must be convinced it is receiving information that is reliable and pertinent to its interests. If the audience detects contradictions or falsehoods, credibility is lost--for a particular operation, and perhaps for future operations as well. Therefore, the cardinal motto for all PSYOP applications is "Truth is the best PSYOP." The advantage of using PSYOP has remained the same throughout its history: if an opponent's attitude can be influenced favorably, his physical resistance will diminish. This means that, when used in combination with other military or political operations, PSYOP acts as a force multiplier, enhancing the effect of those operations on the target.

The term "psychological operations" was first used in reference to surrender messages (messages offering humane treatment for enemy

Page 2606 of 3957

personnel ceasing to resist U.S. forces) sent to the Japanese mainland in 1945. From World War I until the 1960s, "psychological warfare" was the umbrella term in common use. In the 1960s, it was recognized that much more was included in the modern concept than warfare in the conventional sense, so PSYOP became the umbrella term. Psychological warfare, or PSYWAR, remains part of the PSYOP concept. It refers to activity seeking to influence the attitudes and actions of hostile foreign groups in support of national objectives in wartime.[3] Psychological warfare is thus the type of psychological operation most closely connected with military actions: before and during engagement, to minimize the enemy will to fight, and afterwards, to underscore the impact of his losses and the hopelessness of his situation. Military actions themselves (the dropping of the atomic bomb, as an extreme example) may play a psychological role beyond their military impact, because the demonstrated ability to inflict harm has a psychological effect on the potential victim.

In the twentieth century, PSYOP applications have been broadened by the intense ideologies and systems of mass communications that have supported them since World War I. Particularly since the 1930s, the connection of PSYOP with ideology and mass communication has made it a constant strategic element of international politics. Communism and Fascism have used PSYOP in new ways, still considered unethical by much of the world, and forced the opponents of their ideologies to rethink their PSYOP procedures accordingly. The concepts of "disinformation" and "active measures" have been added to the

Page 2607 of 3957

international PSYOP vocabulary, and the definition of "propaganda" has been expanded in this process.

Disinformation, translated from the Russian term dezinformatsiya, has been defined as "any government-sponsored communication in which deliberately misleading information is passed to targeted individuals, groups, or governments with the purpose of influencing foreign elite or public opinion." Disinformation differs from propaganda because the latter does not necessarily involve deceiving a target group, and because disinformation always has a specific foreign target.[4] "Active measures" is a translation of an umbrella Soviet term, aktivnyye meropriyatiya. It has come into English usage because our term "covert activities" does not cover the enormous breadth of activities and participants included in the Soviet concept. In addition to using conventional covert operations, active measures seek to acquire influence over an opponent's attitudes through the media, economic leverage, front organizations, and other seemingly innocent overt agencies with covert sponsorship.[5] The goal of active measures can be summarized as political influence and disruption on an international scale, to achieve a specific result. Both disinformation and active measures are weapons in what Communist dogma sees as peacetime psychological warfare. That warfare is an extension of the international military goals of the Communist movement. Those weapons will be discussed more fully in the Soviet PSYOP section of this survey. But it is important to note that these types of PSYOP have been added only to the Soviet arsenal. While the U.S. must respond effectively to them, it remains committed to the principle of truth in all information programs.

Page 2608 of 3957

"Propaganda" is a broad term that means management of collective attitudes through communications and symbols, for the purpose of promoting or damaging a cause.[6] Among its non-PSYOP applications are commercial advertising, political campaigning, and religious exhortation. (The term was invented by the Roman Catholic Church in its seventeenth-century campaigns against Protestantism.) But in the contemporary public understanding, those aspects have been over-shadowed by the widespread political uses of propaganda in the twentieth century. Although the term had become associated with untruth, propaganda in the PSYOP context must contain large amounts of true information, because of the primary requirement that the audience believe the message. By convention, PSYOP propaganda is divided into three types: white, gray, and black. White propaganda originates from a correctly identified source, black from a completely misidentified source; the source of gray propaganda is masked by transmission through a "front" agency that is nominally independent of the actual source. "Symbolic propaganda" uses action rather than words to produce its effect. The most dramatic example of symbolic propaganda was the use of the atomic bomb in World War II to physically demonstrate the hopelessness of the Japanese position. Several years later, the first Soviet nuclear test sent a symbolic message that had a strong psychological effect on the West.

PSYOP relies heavily on correct evaluation and exploitation of the target's "capacity for self-deception."[7] What is this "capacity for self-deception," and how is it exploited? Approaches differ according to specific conditions, because target groups vary widely. Examples of such

Page 2609 of 3957

target groups are military enemies, political rivals, indigenous populations in guerrilla and counterinsurgency operations, and domestic populations whose support is needed for military or political campaigns. Every identifiable group, society, and nation has a unique set of needs and goals, as well as a uniquely shaped group psychology. The needs and goals may be long- or short-term, military or political, real or imaginary. To cite two extreme examples, the group psychology may be shared by a small group in a short-term, tactical situation (such as a military unit occupying foreign territory), or by several nations in a semi-permanent, strategic situation (such as a group of nations strategically located between two superpowers). Between those extremes are many combinations of needs and goals. If a psychological operation is done properly, the perceptions formed by the target group can be slanted in a particular direction without immediate challenge and actions or attitudes changed accordingly. Psychological operations thus can reduce the risk and expense of coercive action. Such operations are especially useful to groups such as guerrilla forces whose capacity for coercive action is limited. PSYOPs is not to be confused with military deception, which causes an enemy to take inappropriate action by misleading his assessment of positions or intentions.

For the operating side, the immediate target is a weak point of an ultimate target, a place where psychological advantage can be gained and used as a weapon in the longer term. How would this work in the two examples given above? For an occupying force, the points of psychological vulnerability might be distance from home and prolonged exposure to an uncomfortable cultural environment. In such a case, if

Page 2610 of 3957

the opponent's intelligence reveals discontent within the force, a psychological operation might use communications media to convince group members of the loneliness and pointlessness of their venture, and to offer easy surrender conditions. If such a message penetrates without effective challenge, it blunts the effectiveness of the occupation. This approach might be accompanied by terrorists acts that "emphasize" the alienation of the occupiers.

In the international example, smaller nations are subjected to constant superpower propaganda. The Soviet Union uses overt and covert measures in campaigns to split smaller countries from the United States and move them toward a neutral position. In Europe such efforts exploit the substantial public and official desire for peace and security, doubts about American resolve to defend Europe, and fears of nuclear war. A campaign of this sort continues over many years and is woven into the fabric of superpower foreign policy.

In modern times nations increasingly understand the need for propaganda to justify their positions to both domestic and foreign audiences. In peacetime and in protracted war, PSYOP procedures now are integrated with and parallel to measures of military preparedness. Key factors in their success are accurate evaluation of adversary psychology, secrecy, and the output of information that is consistent and credible.

A PSYOP application of particular current value is in insurgency and counterinsurgency activity in what is called "low-intensity conflict" (LIC). Geographically confined to the Third World, LIC PSYOP now is often used in confrontations of client groups of larger powers such as

Page 2611 of 3957

Soviet Union, China, and the United States. Such confrontations occur most often in areas with weak governments, poorly developed or unbalanced economies, and valuable natural resources or strategic location.[8] In recent years, El Salvador, Cambodia, and Afghanistan have been the sites of major superpower insurgency-counterinsurgency efforts. The U.S. has been on both sides of such campaigns, aiding counterinsurgency in El Salvador and the Philippines, insurgency in Nicaragua and Angola. Because guerrilla warfare relies heavily on psychological impact to complement sheer force, successful counterinsurgency must use PSYOP effectively to defeat such campaigns. Victory goes to the side that best understands and exploits the psychology of the indigenous population that is the main source of support for the guerrillas. As insurgency and counterinsurgency have developed, important PSYOP tools are community relations programs, public information, and civic action programs carried out by military personnel in the areas in dispute. Insurgency PSYOP is not limited to proxy confrontations between the United States and Soviet camps. The Ayatollah Khomeini conducted a very effective insurgency against the Iranian government. Exploiting religious fervor and dissatisfaction with the government, the exiled Khomeini smuggled large numbers of tape cassettes into Iran, spreading propaganda to stir revolutionary feeling and build a movement from an initially small number of followers.[9] In this case, no effective counterinsurgency campaign was mounted, and the government fell.

In the contemporary world, unconventional warfare is the rule, not the exception. Given that fact, PSYOP has become a military tool of

greater importance than it was in the "classic" model. This is because the element of psychology is present in all forms and levels of combat, even when some conventional aspects of doctrine become less relevant. When the clear boundaries of open combat disappear and civilian populations become an integral part of every confrontation, PSYOP no longer is a specialized, sinister weapon that can be disregarded because it does not yield spectacular results. Proper PSYOP procedure is often a critical guarantee of success; solid PSYOP approaches to an indigenous population can hold territory with minimal expense or loss of life. But under such circumstances, the PSYOP weapons must be as familiar as any other weapon to all military personnel, because it is they who carry out PSYOP in their everyday contact with the population. In places such as El Salvador, the psychological relationship between military personnel and the civilian population is a prime determinant of the government's success against guerrillas; in this case, U.S. advisers are training the host nation's forces in PSYOP applications. A key word is "integration" of PSYOP into the framework of conventional military doctrine.

Another important application of PSYOP is to rally a domestic population behind a political or military cause. In wartime all nations, whatever their political system, must inspire willing sacrifice by their people. All U.S. war efforts, from the American Revolution to Vietnam, have required extensive "selling." As Korea and Vietnam showed, the complex psychology of a democracy is not always receptive to such campaigns. In such cases, targeted propaganda is the most important tool, but covert active measures have also been useful for totalitarian governments in combating uncooperative internal elements.

Page 2613 of 3957

The historical examples that follow will show the variety of goals, methods, agents, and target groups that have been included in psychological operations of the past. In the sections that follow, discussion of past and current Soviet PSYOP will show how that nation has refined and expanded the entire field to meet the ideological requirements of the Leninist state. And discussion of United States PSYOP, past and present, will focus on the response to Soviet PSYOP campaigns from World War II to the present, in what has become the most massive PSYOP battle in history.

2. PSYOP APPLICATIONS IN HISTORY

The Art of War, a treatise written by the Chinese military thinker Sun Tzu in the fourth century B.C., advocates the idea that an army of superior numbers can be "made not to fight." This idea was in use even before that time. An early example is the slaying of Holophernes, leader of an Assyrian force invading ancient Israel, by the Israelite Judith. Knowing that enemy troop morale depended heavily on the single figure of the commander, Judith gained the confidence of Holophernes, beheaded him, and carried the head back to her people. The symbolism of the missing head and the lost command figure totally demoralized the Assyrians, who were easily routed in spite of vastly superior numbers. The story appears in the apocryphal Biblical Book of Judith; its historical accuracy is unproven, but it remains a good example of assessing the enemy's psychological weak point and using a powerful psychological symbol to bolster the morale of one's own forces.[10]

Page 2614 of 3957

In another example, Ghengis Khan is credited with leading huge hordes of savage horsemen across Russia and into Europe. The size of his armies was exaggerated by agents planted in advance of the army and by rumor and other forms of propaganda. To supplement his PSYOP activities, Ghengis Khan also used rapid troop maneuver to confirm the illusion of invincible numbers. Because the Mongols created an image of total, barbaric domination, target groups never believed they were the victims of astute psychological warfare. Once the image had spread, the Mongols had created a permanent weakness in enemy psychology, and thus gained a military advantage wherever the Mongol reputation was known.[11]

In another instance, during the American Revolution the rebels distributed propaganda leaflets that invited Hessian mercenaries and British common soldiers to desert. One such leaflet provided two short, contrasting lists: the negatives of life in the British Army and the advantages of deserting and settling permanently in America. Promises of leniency and surrender passes have become a staple of battlefield PSYOP. In the Revolutionary War application, the direct appeal exploited the mentality of the occupying force, class differences between officers and enlisted men, and nationality differences between the British and their German mercenaries. Thousands of troops heeded the appeal and never returned to Europe. At the same time, domestic loyalist opposition was muffled by anti-British propaganda in the newspapers of the thirteen colonies.[12]

A qualitative change occurred in PSYOP about l900, when communications became much faster and more inclusive. For the first time, entire nations could be targeted in a psychological operation by

Page 2615 of 3957

print, radio, and film. These media provided direct, reliable transmission of propaganda messages to anyone within sight or earshot. The new media were first used widely in World War I; the British used them to spread rumors of German atrocities, including cannibalism.[13] Because the British had already developed a more sophisticated print and communications system than the Germans, they mounted a propaganda campaign that the Germans could not overcome. The British diplomatic service was also more adept at public diplomacy than its German equivalent. The British used German propaganda ineptitude to their advantage by simply disseminating many undiplomatic German statements, without change or comment; the difference in PSYOP skill between the two sides was enough to make the message clear that the Germans were uncivilized, arrogant "Huns" (a term used by the Kaiser himself for his army). German morale was deflated by having bombastic public statements made into ammunition for the enemy. This propaganda defeat was an important incentive for better performance by German propagandists in the next war.

Because of the expanded scale on which it was used, PSYOP is considered by historians as a crucial factor in the Allied victory in World War I. The Creel Committee, the first specialized U.S. agency for wartime propaganda, succeeded in building domestic support for a war that was not popular initially; it also was the model for later U.S. publicity and propaganda agencies. And the very presence of the U.S. in the war, after long neutrality, had great psychological as well as the military impact. Early in 1917, Germany began sinking all ships approaching Britain, in order to starve the British into surrender. The

Page 2616 of 3957

Germans assumed that Britain would surrender before the U.S. could retaliate for its sunken ships by entering the war on Britain's side; when the error of this gamble became obvious, German morale fell. The German General Ludendorff named allied PSYOP the most important factor in German morale decline.

Before and during World War II, the Nazis used a propaganda machine aimed first at domestic opinion, then at world opinion. The basic psychological assumption of that machine was that public opinion is formed by symbols and images, not rational thought. If the correct symbols were presented with enough force, the public would follow. The theory worked because the audiences chosen were prone to self-deception about certain emotional topics. The charismatic figure of Adolph Hitler provided the ultimate symbol of renewed power to a nation humiliated by the results of World War I. The propaganda machine of Joseph Goebbels convinced Germans and many audiences elsewhere that Communists and Jews were the enemies; that only Fascism could provide protection from them; and that the advance of Fascism was both just and inevitable.[14] The worldwide desire for peace provided a psychological weak point that prevented rational evaluation of these messages; British and United States opposition was delayed until Europe had been conquered piecemeal. By that stage, Germany had developed effective print and broadcast media. A much older form of propaganda dissemination, the mass rally, was also used very profitably. The Germans also made extensive use of "black propaganda" and subversive pro-Nazi groups and agents in occupied territory.

Page 2617 of 3957

After World War II, the Soviet Union raised peacetime PSYOP to new levels of sophistication as the Cold War broke out. And, as new international political conditions developed, tactical military PSYOP began to play a new role. These activities will be the subject of the following sections.

3. SOVIET PSYOP

Like other aspects of Soviet policy, the Soviet theory of psychological operations is based on the teachings of Lenin. The central concept (which sharply differentiates Soviet from United States approaches to the subject) is that the Soviet Union is in a state of undeclared war with capitalist world--a war that will not end until world Communist domination is achieved. Given the magnitude of the goal, moral constraints have had much less influence on Soviet PSYOP than on those of the United States and other countries. In the words of covert operations specialist Chapman Pincher, for the Soviet Union "politics is the continuation of war by other means."[15] On the peacetime strategic level, politics is the main arena of Soviet PSYOP. However, this approach was not invented by the Bolsheviks in 1917; it was used sporadically for centuries by the Russian tsars in domestic and foreign relations, but it has been codified and intensified in the last seven decades. Soviet PSYOP is by far the most intensive, complex and consistent peacetime campaign of its type ever launched. The Soviet political system backs its PSYOP policy with whatever resources are necessary to achieve its goals.

Page 2618 of 3957

Soviet PSYOP campaigns are a tightly integrated combination of conventional devices, influential "legitimate" institutions such as the diplomatic corps and the press, and covert activities. On the level of open propaganda, the goal is to "out-talk" the adversary, establishing terms of international dialogue favorable to the Soviet Union. This process is constant, aimed at wearing down the West and convincing other listeners that the Soviet position is valid. A favorite message in the Soviet arsenal says that it is the West that is on the psychological offensive: with an insatiable ideological drive, imperialism uses all possible psychological means to undermine the progressive development of other nations toward the ideal, inevitable Communist order. Furthermore, Dmitri Volkogonov, the leading Soviet PSYOP theoretician, says that the imperialist powers invented psychological warfare to maintain world domination.[16] Briefly stated, his view is that imperialist PSYOP seeks to divide the communist world, disorient its people politically, and falsely portray the Soviet Union as the main threat to world peace. Volkogonov attributes virtually all the known Soviet active measures methodology to the United States and its imperialist allies. To the extent that this idea is believed around the world, Soviet PSYOP succeeds in putting the debate into its terms.

Three departments of the Soviet government supervise active measures and propaganda activities. The International Department of the Communist Party of the Soviet Union provides liaison with nonruling Communist parties and front organizations abroad, directs their active measures, and apportions responsibility for various types of activity. This department also suggests new measures to advance the international

Page 2619 of 3957

policies of the ruling Politburo. Overall foreign policy is often affected by activities of the International Department (I.D.), which has no equivalent in Western governments.[17] The functions of this agency appear to have been expanded and refined in recent years, especially after the abolishment of the party's International Information Department. A key figure in this development was Anatoli Dobrynin, former Ambassador to the U.S. and head of the I.D. until late 1988. The latter was in charge of the overall propaganda apparatus until l986, when that function was split between the I.D. and a second major agency, the Propaganda Department. The latter now runs all domestic and foreign propaganda efforts. Its level of sophistication rose especially fast under Aleksandr Yakovlev, who until reassigned late in l988 was an effective domestic and international spokesman for the Gorbachev reforms.[18] The third propaganda agency is the KGB, or Committee for State Security, which handles espionage and disinformation activities at home and abroad. The disinformation mission aims mainly at destabilizing and misleading the NATO alliance and Japan, while concealing actual Soviet policy aims. In addition to the three major agencies, the Ministry of Foreign Affairs has broad responsibility for the overt Soviet press and foreign cultural relations--which in the Soviet system are closely coordinated with less "legitimate" PSYOP functions.

Although government reform has changed some of the structure of this system, there is evidence that even more resources are now allocated to PSYOP activities. History has shown that active measures are emphasized in times of improved relations with the West because targets become more vulnerable in such times.[19]

Page 2620 of 3957

Favorite covert devices of Soviet active measures are forged documents and planted media stories, surfacing in forms that erode the position of the ultimate target. Often, forged United States and NATO documents are used to show that the West is intent on aggression in Europe or the Third World. Active measures aim to divide the target group (most often NATO) by intensifying latent hostilities within it. Germany is a favorite target for such divisive methods because the Nazi past remains a psychological weak point for all of Europe. Print and broadcast media are nearly always used to achieve maximum dissemination of a message. The procedure is to identify a potentially sympathetic audience with political influence (for example, the leftist West German Green Party and the Labor Party in Great Britain), and tailor the message for maximum favor with that audience.[20] In recent years, this tailoring includes maximum exposure of the terms perestroika (restructuring) and glasnost (openness), which for the Western audience indicate that hoped-for Soviet internal reforms are taking place and Cold War tension is easing. Debate flourishes on the actuality of those reforms, but there is no doubt that the terminology used to describe them has been quite successful in exploiting a Western psychological preoccupation.

A variety of agencies--from individual covert agents to client nations--carry out Soviet psychological operations. In the Third World, Cuba is an especially active agent, working on Soviet operations and independently. A major front organization for Soviet operations is the Helsinki-based World Peace Council. That organization, indirectly controlled by the Communist Party of the Soviet Union, plays a major role in stirring anti-NATO feeling in Europe. Political influence

Page 2621 of 3957

operations are a special type of active measure, using personal contacts to advance a Soviet position in foreign decisionmaking institutions. These contacts range from foreign figures (diplomats, journalists, scientists) to KGB agents "planted" in positions of influence.[21] Because the Soviet Union is the initiator, it has been able to choose its "battlefields," where chances of achieving psychological influence are greatest and opponents can be put on the defensive. In target countries, such campaigns exploit weak points such as ethnic rivalries, distrust of existing social or government systems, and class antagonism. And active measures are always used in conjunction with other devices to advance Soviet foreign policy goals.

A few examples of Soviet active measures will demonstrate their goals and methods. In 1976, a testament of Zhou En-lai surfaced in a prominent Japanese newspaper. The document spoke against the Cultural Revolution in China and advocated closer relations with the Soviet Union. It had been placed by the KGB office in Tokyo.[22] In another instance, the KGB created a pamphlet, entitled CIA Insider, purported to be a listing of CIA agents and press outlets all over the world. The pamphlet, released in Switzerland, attempted to show the pervasive CIA influence in the Western press; it is an example of the "upside-down" black propaganda ploy of attributing Soviet PSYOP methods to Western nations.[23] And in the early 1960s, a long series of items planted in the European press ruined the political career of Franz-Josef Strauss, a staunch advocate of United States armaments in West Germany. Strauss was painted as a warmonger seeking revenge on the Soviet Union for the results of World War II.[24] In another example, in 1979, Radio Ba Yi

Page 2622 of 3957

began broadcasting into China from the Soviet Far East. Its positions on domestic, diplomatic and military issues aimed initially at discrediting Deng Xiaoping, who was also attacked directly by the station. The Soviet Union acknowledged no role in the broadcasts, which supported all Soviet positions and advocate closer Sino-Soviet relations.[25] In the recent Soviet effort for better relations with China, the station was shut down.

The Soviet Union has also found itself on the negative side of PSYOP activities. When it invaded Afghanistan, counterinsurgency efforts failed to win over the indigenous population, and the occupying force became demoralized by guerrilla psychological warfare. And in l983 the Soviet Union shot down a Korean civilian airliner, causing an uproar in world opinion. The Soviets tried to turn press attention "upside-down" by claiming that the United States had provoked the incident--but Soviet statements were poorly coordinated and contradictory, and they failed to win the battle of world opinion.[26] The obvious fabrications and confusion in the propaganda line violated the basic principle that information used in PSYOP must be believable to the target group.

Historically, Soviet active measures have had several weaknesses. The Soviet ideology of atheism and Communism is unattractive to many audiences, so it must be concealed or glossed over in many cases. Acts such as the Afghan invasion have eroded trust in the Soviet Union as defender of Third-World liberty. And many forgeries and press placements have been poorly executed and very obvious.[27]

Most experts on the Soviet Union agree that in recent years the sophistication of Soviet propaganda and active measures has grown, and some of their weaknesses have been eliminated. First, the Soviet Union

Page 2623 of 3957

now has a charismatic leader in the person of Mikhail Gorbachev. This is a weapon the Soviets have never had before. Gorbachev is able to send direct, credible messages to world leaders and use international media to propagate a view of the Soviet Union as a reformed, peace-loving, and benign nation. Like Roosevelt, he has cultivated a personal image of honest and moral humanity that has universal appeal. Following the cardinal principle of PSYOP, that all messages be based in truth, Gorbachev's messages utilize the actual liberalization of internal and external Soviet policy (highlighting such events as removal of Soviet tanks from Hungary and the liberation of Andrei Sakharov) to maximum effect in shaping the new image. Arms control proposals, slipshod and obviously insincere under previous regimes, now impress even Western skeptics with their scope and consistency. Gorbachev has also shown wisdom in choosing and shaping his messages to target audiences, alternating between firmness and conciliation. At the same time, there is strong evidence of continued commitment to Lenin's principle of all-out political war as an extension of military struggle in peacetime. A 1988 report of the United States Information Agency lists major active-measures "black" programs begun after Gorbachev came to power. Among the messages widely disseminated by these programs: the AIDS virus was created in an American laboratory for germ warfare; the United States developed a weapon that kills only non-whites; Latin American babies are butchered and sold to U.S. distributors for use in medical transplants; and the CIA murdered Swedish Prime Minister Olaf Palme. While such messages have not changed substantially since earlier years, the approach of more subtle, "gray" programs has changed. Soviet-controlled

Page 2624 of 3957

international peace groups now seek a broader appeal by softening their rhetoric; other Soviet-influenced groups now seek wide contact with Westerners, to subtly convince them that Soviet positions are just; and the Soviets now sponsor many international peace forums, including respected professional figures, to enhance their peace-loving image. All these efforts complement the statements and actions of Gorbachev, whose programs of glasnost and perestroika seem committed to greater Soviet openness and nonmilitary programs.[28]

In summary, the Soviet Union is by far the largest practitioner of PSYOP in the world. PSYOP has been an integral part of its foreign and domestic policy since the Bolshevik Revolution. In organizational structure and function, Soviet psychological operations overlap the more conventional functions of government and diplomatic institutions. Because PSYOP is still viewed as another version of military struggle, coordination of tactical military doctrine with long-term strategic-international goals remains especially close and consistent.

4. UNITED STATES PSYOP

In the "age of communications," all nations must find ways to "explain themselves" to the rest of the world, and to their domestic populations. The more international obligations the nation has, the more vital is the process of sending messages that create desirable psychological responses in their recipients. As described in the previous section, the United States faces a sustained, multilevel Soviet PSYOP

Page 2625 of 3957

campaign. The campaign aims to discredit the United States and its allies in the view of the world and of their own populations.

Since mass communications became a PSYOP tool, the United States has been involved in several wars requiring domestic and international justification of its position versus adversaries such as the Germans, the Japanese, the Koreans and Chinese, and the Viet Cong. In each conflict, large-scale tactical PSYOP machinery also went into motion. Generally, such efforts have been a response to the initiative of an opponent; neither strategic nor tactical PSYOP apparatus has been at adequate strength before the threat appeared. And since World War II, moral and bureaucratic questions have interfered with coordination of PSYOP programs. As the definition of the word "war" becomes less clear, domestic perceptions of military and political goals become more vulnerable to psychological targeting by adversaries. This was seen most dramatically in Vietnam, but it also applies to current low-intensity conflict situations.

In World War II, a very effective PSYOP weapon of the United States was the charismatic leadership of Franklin Roosevelt, whose inspirational radio broadcasts were admired by Joseph Goebbels, Hitler's propaganda chief.[28] The United States created two major agencies for PSYOP activities in the war: the Office of War Information (OWI, for domestic and foreign propaganda), and the Office of Strategic Services (OSS, among whose functions was direction of military PSYOP). The OWI consolidated a number of information agencies that existed before the war. Wartime urgency did not prevent friction between the two agencies, congressional interference, and diffusion of PSYOP and

propaganda decisionmaking among theater commanders of the Army and Navy--factors that hindered PSYOP missions in many cases.[29] But the propaganda of the OWI was marked by careful evaluation of target psychology, appropriate messages, and effective delivery. For example, the OWI aimed surrender appeals at the psychological vulnerabilities of fanatical Japanese soldiers, inducing large numbers to surrender in spite of a military code that seemingly precluded such behavior.[30] Although the United States PSYOP effort in World War II was somewhat cumbersome and disorganized, there were enough instances of such astute targeting to overcome the head start that the Axis powers had gained in propaganda.[31]

After the war, the word "propaganda" was associated in the United States with Fascism and Communism, the systems that had "reinvented" the device for their ideological advancement. The American public did not consider propaganda an activity to be pursued in peacetime by the leader of the free world. There followed a period of indecision about the role of PSYOP in peacetime, and most wartime PSYOP units were disbanded shortly after the war ended. When the Korean War began, only one operational psychological warfare troop unit existed. As in the previous war, a strong PSYOP effort was eventually mounted in Korea, offering mainly radio, loudspeaker, and leaflet support of conventional ground troops. But complaints of weak support often came from the PSYOP units at the front.[32] The Korean War was the stimulus for formation in 1951 of the Office of the Chief of Psychological Warfare (the first centralized agency for PSYOP) and the Psychological Warfare Center at Fort Bragg in 1952. The former no longer exists, but the

Page 2627 of 3957

latter is now the center of PSYOP training and research for all the Armed Forces. In 1953 the United States Information Agency (USIA) was created for international dissemination of information.

In general, withdrawal from PSYOP activity after World War II was slowed by the realization that the Soviet Union was now a formidable enemy in the Cold War. This realization was based on two ideas: that the world does not automatically understand or approve of the United States; and that the Soviet Union is ready and able to exploit doubts about the morality and motives of the United States, in numerous overt and covert ways. An initial reaction to this situation was creation of the Central Intelligence Agency in I946, with authority for covert psychological and political activities. The size and scope of this organization grew very fast during the Korean War.[33]

Beginning about 1960, Communist expansionist doctrine has sought to exploit "wars of liberation" and insurgencies in areas previously under European colonial control. Soviet propaganda has portrayed the Soviet Union as defender of oppressed peoples, and the United States as an exploiting imperialist.[34] To meet this potent psychological gambit of guerrilla war, U.S. PSYOP applications in influencing the Third World and conducting unconventional warfare have become increasingly important in recent years.

How successful has the United States been in meeting postwar PSYOP challenges? The record has been mixed. A number of systemic differences prevent United States PSYOP from ever being the all-pervasive, centralized extension of foreign policy that it is for the Soviet Union. In the United States, all information cannot be officially

Page 2628 of 3957

controlled; secrecy is difficult even in the most critical cases; and decisionmaking always involves a number of conflicting views. The Soviet Ministry of Foreign Affairs is mobilized for propaganda activities that the United States State Department could never undertake. Likewise, no American institution has the total control exercised by the Communist Party of the Soviet Union.

The Vietnam War was the most recent large-scale PSYOP campaign of the United States. As in Korea, the main tactical devices were loudspeakers, leaflets, and radio. The Chien-Hoi (Open Arms) amnesty program stressed the strength of the South Vietnamese Army and the hopelessness of the Viet Cong position. In many respects, this massive effort fell short on both strategic and tactical levels: the first when domestic and international doubts about legitimacy were not met by United States official information, the second when PSYOP and military operations failed to complement each other, and the enemy was able to exploit the psychological vulnerabilities of both United States troops and the indigenous population of Vietnam.

However, a number of post-Korea United States psychological operations have been successful. In 1965, American troops invaded the Dominican Republic to quell what was believed to be the first stage of a Castro-type revolution. During the American presence, liaison between military and civilian PSYOP groups was quite successful in supporting the military and political aims of the occupation.[35] According to verbal reports of participants, leaflets became such a valuable source of information that they were eagerly purchased in the capital city of Santo Domingo. In the Vietnam War, the Civilian Operations and Revolutionary

Page 2629 of 3957

Development Support centralized and focused counterinsurgency targeting of indigenous populations in some areas.[36] The Joint U.S. Public Affairs Office (JUSPAO), founded to integrate public information and PSYOP functions in Vietnam, achieved a number of successes. CounterPSYOPs activity in Europe in the early 1980s ensured timely installation of intermediate-range missiles, despite an intensive Soviet psychological campaign to exploit European peace and antinuclear groups. And in the Grenada invasion of 1983, U.S. amnesty messages and rewards substantially reduced the opposing force.

After Vietnam, overall budgetary support for PSYOP declined. Army PSYOP units in Okinawa, Panama, and Germany were disbanded. This left the 4th Psychological Operations Group (consisting of four battalions in l988) at Ft. Bragg as the only active-duty unit in the United States Armed Forces with an exclusively PSYOP mission.[37] A National Guard unit remained in the Air Force and support units remained in the Navy, but Ft. Bragg became the source of PSYOP support for all types of military operations. If medium- and high-intensity conflict should break out, support would come from a reserve PSYOP unit trained at Ft. Bragg. In peacetime, the active-duty unit builds the research base for future readiness, and it has the mission of PSYOP support for low-intensity conflicts and peacetime overt activities.[38] Because the latter type of support has growing potential for application, a number of leading PSYOP authorities have agreed that United States capability needs to be expanded, and that PSYOP expertise should be integrated into standard U.S. military training. This group includes Alfred Paddock, formerly commander of the 4th Psychological Operations Group and director of

Page 2630 of 3957

psychological operations in the Pentagon; Melvin Kriesel and Michael Totten, former commanders of the 4th Psychological Operations Group; and Sam Sarkesian, professor of political science and former chairman of the Inter-University Seminar on Armed Forces and Society.[39]

Since the Reagan Administration put additional emphasis on information as one of the elements of national power, overt psychological operations in peacetime have been increased. These psychological operations have included training and advice to indigenous forces allied with the United States, surveys and assessments leading to actual operations, miscellaneous support to host nation PSYOP programs, and other overt PSYOP projects. Typical of PSYOP support to host nation programs is the long-term program created for El Salvador. One trainer is assigned to the U.S. military group in the capital, San Salvador, to coordinate all U.S. PSYOP programs in the country. Over the years the U.S. PSYOP contribution has resulted in significant change not only in the PSYOP practices of the El Salvadoran Armed Forces, but also in their general approach to insurgency, including an increased respect for human rights.

Programs similar to the El Salvadoran project exist worldwide, as established by DoD Directive S-3321.1. This directive requires every Unified and Specified Commander-in-Chief to conduct overt psychological operations in peacetime as appropriate to the military mission.

Overt psychological operations are coordinated with the State Department and require Country Team approval for each operation. The operations are coordinated with the United States Information Agency (USIA) to prevent dissemination of conflicting information. DoD

Page 2631 of 3957

operations attempt to fill the informational niches not filled by other agencies, dealing with subjects and areas of primary DoD concern but of secondary importance to the other information agencies.

At the strategic level, covert psychological activities are centralized in the Central Intelligence Agency, the latitude of whose operations has varied with the degree of oversight exercised by Congress. Meanwhile, overt propaganda is less centralized, and it is isolated from covert activity. In the I980s, the United States has sought to bolster programs of cultural relations and positive image-making abroad. "Public diplomacy" has been used much more aggressively to correct the record about United States intentions and in counterattacking Soviet and Cuban propaganda. In I983 a Special Planning Group was formed, including representatives from all government agencies having propaganda functions. The goal of this group was to centralize the public diplomacy effort and put forth a coherent, positive international image. The USIA has been instrumental in several specific improvements: coordinating United States explanations of Central American policy; ensuring INF installation in Europe; and increasing the budget for cultural relations and propaganda.[40] An interagency committee for public diplomacy, first used in the INF European campaign, continues low-key, behind-the-scenes coordination of policy statements and explanations.

But policy agencies still lack coordination with public diplomacy efforts; agency roles in PSYOP are not well defined; and the United States has often found itself in a reactive position in international situations requiring PSYOP applications. Because of agency

Page 2632 of 3957

compartmentalization, messages often lack the crucial element of credibility because they are contradictory. And, in the words of Army intelligence officer and scholar John Oseth, there is an "American suspicion of the tools of psychological manipulation,"[41] which insulates American institutions from association with such activities. On the military side, this takes the form of suspicion toward peacetime support of elite, special-purpose groups, such as those that would be given exclusively PSYOP missions.

A number of separate United States agencies now disseminate propaganda worldwide. The United States Information Agency runs the Voice of America and various cultural and information programs abroad. The Board for International Broadcasting runs Radio Free Europe and Radio Liberty, which broadcast into the Soviet bloc. And the Central Intelligence Agency continues its administration of covert PSYOP and counterPSYOPs activities abroad. DoD peacetime overt PSYOP activities have joined these groups in disseminating international information. Like the USIA, DoD disseminates international information only to foreign groups overseas.

As a result of governmental recognition of PSYOP deficiencies, in 1985 the Secretary of Defense promulgated a Master Plan to revitalize PSYOP. This plan reviewed the considerable inadequacies of PSYOP at that time, and recommended remedies for each item. Responsibility for DoD policy was given to the Under Secretary of Defense for Policy, which in turn created a Directorate for Psychological Operations assigned to the Deputy Under Secretary for Policy. This directorate was to be responsible for PSYOP policy and monitor response to the Master Plan.

Page 2633 of 3957

The active duty PSYOP group was fully manned for the first time in years, and modernized equipment of all types replaced the Korean War-vintage radios, presses, and loudspeakers of the PSYOP units. PSYOP education and training were greatly improved, with a new Army functional area code assigned for PSYOP officers, and an enlisted military specialty was created. New awareness and staff training courses were created, to provide officers and enlisted personnel to meet a new demand for competent staff personnel. PSYOP staffs at all levels were created and strengthened, and they were moved out from under control of special operations staffs. The PSYOP Worldwatch Program was created, as a new, proactive body at the Joint Staff level, monitoring daily intelligence and open-source traffic for situations in which PSYOP input is appropriate. Similar bodies were created at the Unified and Specified Commands, adding a new element of proactive PSYOP to replace the traditional U.S. reactive posture. The Secretary of Defense assigned PSYOP forces to the newly created United States Special Operations Command, giving a four-star proponent for PSYOP and establishing a new support structure for Unified and Specified Command psychological operations across the spectrum of conflict. Heightened preparedness for wartime, contingency situations, low-intensity conflict, and peacetime operations resulted from the changes initiated from the Master Plan. By 1989, the response to the Master Plan had so changed the PSYOP environment that a new plan, was needed to accommodate the progress made since 1985. Because of the nature of PSYOP, these peacetime programs provide the most realistic training for PSYOP personnel. The overall effect of this PSYOP renaissance has not yet been calculated,

but many successes in peacetime and low-intensity conflict have already been ascribed to it.

In conclusion, the United States has practiced psychological operations in the twentieth century when such measures were a military or diplomatic necessity, but there has been great reluctance to organize and maintain units with PSYOP capability during peacetime. When the "rules of the game" changed after World War II, awareness of the value of PSYOP gradually increased, and a number of organizations were given distinct functions such as covert activities and distribution of cultural information. But no overall, permanent coordination structure has appeared to maximize the PSYOP potential of each organization as needed, either on the tactical-military or the strategic-international level.

On the tactical level, United States military PSYOP staffing has been low, and military personnel are not widely trained in the goals and methods of psychological operations. Writers commenting on this situation have pointed out that the potential requirement of United States PSYOP aid to counterinsurgency in the Third World seems to be increasing, without appropriate improvement in readiness. Although efforts were made periodically toward a comprehensive U.S. tactical PSYOP doctrine, the policy has been to approach each case individually after it arises, with no overall philosophical context.[42] The most recent of those efforts, the DoD Master Plan, has focused greater attention and resources on the subject.

Page 2635 of 3957

5. CONCLUSIONS

The time-honored principles of PSYOP retain exactly the same basic value as they have always had: as a force multiplier that complements military operations by lessening the determination of the target to resist. But since the days of Genghis Khan the definition of PSYOP has come to include a much broader range of activities and methods: from organized campaigns using leaflets and speakers in conventional tactical combat, to official statements by national leaders aimed at an international audience, to the everyday interaction of non-specialized military personnel with a host population. In spite of expanded application, the basic principles still apply: the message must be credible, meaning that it must be based in truth; it must be chosen and shaped to create a positive impression on the target audience; and it must be integrated into the overall military or political program of which it is part.

Contemporary PSYOP is practiced by many countries and agencies, in many circumstances, for a variety of goals. For the Soviet Union, it is a standard part of foreign policy, an accepted method of achieving national goals. For the U.S. it retains a negative connotation, both in political and military usage, although its utility has been proven in many situations. Consistency and coordination have been missing even in U.S. wartime PSYOP. For other nations involved in low-intensity or unconventional warfare as sponsors or participants, PSYOP has become an invaluable tool in gaining the support of segments of a population. For this reason, U.S. PSYOP support of allied nations, and effective

Page 2636 of 3957

PSYOP approaches to neutral nations, has become a vital part of the U.S. program of protecting or influencing those countries.

All of this occurs in a world where: the chief potential military opponent has a dynamic, sophisticated, multilevel PSYOP apparatus; conventional military operations are increasingly costly, while PSYOP remains relatively inexpensive; and the shadow of nuclear war puts most world conflicts into vague, quasimilitary forms. Under these conditions the psychology of conflict assumes a primary role, one that must be understood by every military commander.

13. ABSTRACT (maximum 200 words)

Mongolia is bordered by two powerful nations that are vying for greater influence on the global stage. As a relatively smaller, democratic nation vulnerable to influence from these prominent neighbors, Mongolia faces increasing challenges in governance. One of the primary challenges is maintaining Mongolian independence, which requires national resilience and resistance in the face of external influence. Specifically, it requires psychological resilience in all sectors and all layers of society as a critical component for comprehensive defense. Mongolian national defense policies have relied on conventional military forces for decades, but those policies do not include the psychological preparation and involvement of the Mongolian population. This thesis looks to Nordic countries and Taiwan for insight. Norway, Finland, and Sweden maintain a comprehensive defense, or "total defense," approach that systematically invests in social and psychological resilience. This thesis asks, How can Mongolia achieve similar levels of national resilience? To address this question, this research uses NATO's comprehensive defense model as a framework to explore lines of effort Mongolia can invest in to enhance social and psychological resilience across all areas of society through education, information, and inclusion. Furthermore, the study makes recommendations on how to begin implementing programs to develop Mongolia's psychological resilience using existing resources.

ACKNOWLEDGMENTS

I would like to express my sincere appreciation and deepest gratitude to my thesis advisors, Douglas A. Borer and Shannon C. Houck. Their valuable expertise and timely feedback helped me accomplish my objectives on time. They deserve my special thanks for their time, patience, helpful critiques, and comments.

I wish to express my special acknowledgment to Mr. Michael Stevens, Mrs. Julia McClenon, and Mr. Robert J. Shumaker for their support and recommendations, and for opening doors. Without the mentorship and support, this thesis would not have been completed.

Most of all, my greatest appreciation goes to my family (Batsaikhan Bolor, Yalaltbayar Misheel, and Margad Bayasgalan) for their gracious and kind support. This thesis and my educational experience at the Naval Postgraduate School would not have been possible without their support and reassurance. For that, I am everlastingly grateful.

I. INTRODUCTION

> Conquering the world on horseback is easy; it is dismounting and governing that is hard.
>
> —Genghis Khan

Mongolia is bordered by powerful nations that are vying for greater influence on the global stage. As a relatively smaller, democratic nation vulnerable to influence from these prominent neighboring countries, Mongolia faces increasing challenges in governance. One of the primary challenges is maintaining Mongolian independence, which requires national resilience and resistance in the face of external influence. Throughout history many countries have faced similar dilemmas. When faced by potentially threatening neighbors often smaller states will band together in alliances, but also seek to strengthen their internal capacity to maintain independence. Such is the contemporary case in Europe, where the concept of "comprehensive defense" underscores European efforts at resilience and resistance.

The *NATO Comprehensive Defense Handbook* (CDH) defines comprehensive defense as "an official Government strategy, which encompasses a whole-of-society approach to protecting the nation against potential threats,"[1] the purpose of which is "developing the capability and willingness of all members of society to directly contribute to their safety, security and natural right to self-determination."[2] The core pillars of comprehensive defense include: social and psychological, economic and essential services, military, cyber, civil, and internal and border security. As part of the whole-of-society approach, Mongolia must pursue lines of effort within each of these pillars. Consistent with that overall goal, this research focuses specifically on social and psychological resilience.

---

[2] NATO Special Operations Headquarters, 15.

Page 2657 of 3957

Mongolian national defense policies have relied on conventional military forces for decades, but those policies do not include the psychological preparation and involvement of the Mongolian population. Smaller nations in other parts of the world face similar challenges and in response have invested in comprehensive defense efforts. Nordic countries and Taiwan in particular offer important insights that might be useful for Mongolia. Nordic states' (Norway, Finland, and Sweden) comprehensive defense or "total defense" approach systematically invests in social and psychological resilience. Psychological resilience involves "developing and maintaining the will, resolve, and determination to overcome a national crisis and defend the nation … [as] an element of national pride and mutual respect which contributes to the strength and commitment to overcome a crisis and the faith that it will be overcome."[3] Nordic countries have seen success in this domain. For example, in a Gallup Poll in 2015, 74% of Finns said they would fight for their country, which was the highest percentage in Europe.[4] Moreover, according to a 2018 annual opinion poll, the most recent, by the non-governmental organization (NGO) "People and Defence," 81% of Norwegians support a military defense in the event of an attack, 79% want to retain conscription, and 72% are willing to participate in defense to the extent that they are capable.[5]

How could Mongolia achieve similar levels of national resilience? To examine this question, this research uses NATO's comprehensive defense model as a framework to explore lines of effort Mongolia can invest in to enhance social and psychological resilience across all areas of society through three lines of effort: (1) education, (2) information, and (3) inclusion. This research is focused on national defense, but it is by no means designed to only inform the Mongolian Ministry of Defense (MOD). Successful comprehensive defense planning requires a whole of government approach,

II. THE LITERATURE REVIEW AND APPROACH

> One must learn by doing the thing, for though you think you know it, you have no certainty until you try.
>
> —Sophocles, 400 B.C.

A. BRIEF OVERVIEW OF THE LITERATURE AND SIMILAR CASES

Historically, small nations have struggled to deter and resist aggressive superpowers. However, sometimes the weak and small have defeated the strong and large. Ivan Arreguín-Toft, a U.S. Army electronic warfare and signals intelligence veteran and University of Chicago PhD, argues that when large states attack with a "direct strategic approach and small states defend with an indirect strategy such as preplanned resistance, the weaker actor tends to win."[6] Defending against superpower nations like Russia and China, however, small nations would be likely to repeat the outcome of the Russia-Georgia War in 2008, which seemed to demonstrate that a minor country cannot stand up to a superpower in a conventional war. "The defeat of the Georgian Armed Forces, fighting alone against the superior Russian military, was a warning signal to other small nations, not just in eastern Europe, but around the world."[7] Arreguin-Toft would argue that Georgia lost because it attempted to fight the superior Russian force with conventional military means: a "direct approach." It might have fared better by taking an "indirect approach" that would have included guerrilla warfare.

In the article "The August 2008 War in Georgia: From Ethnic Conflict to Border Wars," Vicken Cheterian identifies that "Great powers' military and economic interests did not always work together with the UN [United Nations] and OSCE [Organization for Security and Cooperation in Europe] diplomatic solutions."[8] Cheterian illuminates three

Page 2661 of 3957

things those small nations need to understand in the modern world. These include (1) never provoke superpowers in a conventional way; (2) never depend on external supports; and (3) without civilian support "total defense" will be useless. Margus Kuul, of the Estonian Defense Force, establishes that "a strategy which combines civil resistance strategy and unconventional military action can be an effective component of a total defense capacity."[9] This means not only that Mongolian military personnel need to learn comprehensive defense policies, but the strategic decision-makers also need to understand the "total defense" concept and its key factors.

Since 2018, two important documents on irregular warfare have been published that highlight the need for improved understanding of comprehensive defense or total defense strategies as a means of national deterrence. The first is the *Resistance Operating Concept* (ROC) published by the Swedish Defense University.[10] The ROC is important to Mongolian comprehensive defense strategies because it serves as a master text for a whole-of-government approach to national self-defense. The second document is the *NATO Comprehensive Defense Handbook*, mentioned earlier[11] Volumes I and II of NATO's CDH are also important to understanding and developing comprehensive defense strategies. The CDH recommends a whole-of-society comprehensive defense and deterrence approach to small nations, and it contains a full training spectrum for asymmetric defense components. Both volumes create greater awareness about psychological resilience concepts and implementation of the key tenets of preparing for comprehensive defense.

The literature used for this research on psychological resilience as a comprehensive defense focuses not only on the ROC and NATO handbook, but also on related case studies about psychological resilience in the policies of Nordic states and Taiwan. With the exception of Denmark, the Nordic states (Norway, Finland, and Sweden) and Taiwan maintain conscription of their personnel , as does Mongolia. One of

[11] NATO Special Operations Headquarters, *NATO Comprehensive Defense Handbook*, 3.

Page 2662 of 3957

the significant advantages of conscription is that it guarantees an adequate number of reserves in the military. Also, it boosts the national pride of most citizens. The Nordic states have incorporated psychological resilience into their strategy since 2014, and they are disclosing their national best practices with NATO countries. In terms of psychological resilience, the Finnish government defines it as "the ability of individuals, communities, society and the nation to withstand the pressures arising from crisis situations and to recover from their impacts."[12] This definition has demonstrated that Finnish national defense policies consider psychological resilience a crucial element. Finnish people believe "their country's strong public education system, long history of balancing Russia, and a comprehensive government strategy allow it to deflect coordinated propaganda and disinformation."[13] Meanwhile, the Sweden Defense Commission has proposed an "inquiry into psychological defence against propaganda and disinformation and distributed an information pamphlet to all households."[14]

In addition to the European countries discussed, Israel, Singapore, and Taiwan are practicing comprehensive defense policies successfully. The Republic of China (Taiwan), which is considered a nation, often depends on economic trade and shares (maritime) borders with the People's Republic of China (PRC), just as Mongolia does in East Asia. Beijing has been practicing economic sanctions in the last years in order to influence the Taiwanese government and business sectors. But Taiwan shows a positive example of social resilience on this matter. President Tsai Ing-wen's diversification strategy and alternative investment options for the economy resulted in "the general public becoming more aware of the downsides of dependence on bilateral trade and cautionary sentiment towards China's assertiveness."[15]

B. APPROACH

Most Mongolian national defense documents primarily focus on physical resilience; therefore, further research is needed to examine how small states can prepare and train their civil societies for psychological resilience as a pillar for a whole-of-society defense. While decision makers enhance Mongolian defense forces' readiness, they fail to persuade the Mongolian private and civilian sectors to participate as a component of asymmetric warfare. Namely, the existing defense strategy omits the potential for participation by civilian sectors as a practical strategic alternative that could strengthen Mongolian deterrence capacity.

To fill these gaps, thesis explores how CDH would look in the development of the Mongolian psychological resilience. The study therefore focuses on three lines of effort: (1) education, (2) information, and (3) inclusion. First, this thesis identifies education programs promoting the whole-of-society approach to the Mongolian population, including the public, private, and civilian sectors for enhancing their resilience capabilities. Second, the research explores information programs (e.g., digital literacy) that help ensure society is accurately informed about current conditions or trends that may affect national safety or security. This is a critical problem. According to January 2021 estimates, there are 2.60 million social media users in Mongolia.[16] Linda Sanchez, U.S. special rapporteur to NATO's Committee on Democracy and Security, highlights that "disinformation and propaganda contribute to heightening the polarization of societies and increasing dissatisfaction with democracy."[17] Many Mongolians understand that disinformation and propaganda are used and yet citizens receive and believe widely disseminated false and misleading narratives from domestic and external ill-intentioned actors. For instance, the people who have no basic facts about internet security are targeted by cybercriminal groups. According to local security authorities, "Police in the Mongolian capital of Ulaanbaatar have apprehended 800 Chinese citizens and confiscated

Page 2664 of 3957

hundreds of computers and mobile phone SIM cards as part of an investigation into a cybercrime ring."[18] Therefore, this thesis further identifies the Mongolian population's social media vulnerabilities, including existing political debates and social grievances, and external threats facing the nation (e.g., weaponized information and other psychological tools used to influence Mongolia). Understanding the information environment in Mongolia will inform ways for developing an underlying social resilience. Third, this thesis examines ways Mongolia can foster inclusion across all sectors of society. Inclusion, or group belongingness, is "a fundamental human"[19] need, and satisfying this need as a valued Mongolian citizen has benefits beyond fulfilling the individual's need to belong—it also strengthens the group itself by creating members that "strongly identify with the group's values and goals."[20] Many initiatives that promote societal inclusion overlap with the education and information lines of effort (e.g., bridging the digital divide; teaching Mongolian language, history, and traditions), but research suggests some additional avenues. Some of these include "inclusive leadership styles"[21] and the use of national narratives that promote unity and strength. Arie Kruglanski, distinguished social psychology professor at the University of Maryland, College Park, suggests governments should create opportunities for citizens to pursue "significance-bestowing occupations" and "create organizations such as the Peace Corps and Doctors Without Borders that take advantage of young people's desire to be idealistic and to do something for their country."[22]

Finally, this thesis emphasizes the role of partner nations in supporting Mongolian national psychological resilience and future recommendations for Mongolians on psychological resilience. To this end, in recent years the Mongolian government has been

pursuing what is known as the "Third Neighbor Policy." This multi-lateral approach seeks to build effective ties with actors in states that do not physically border on Mongolia. It is believed that doing so will help further stabilize Mongolia.

Page 2666 of 3957

III. EDUCATION

> Education is the basic tool for the development of consciousness and the reconstitution of society.
>
> —Mahatma Gandhi

According to the NATO handbook, "national resilience begins with the individual."[23] Therefore, enhancing individual resilience is one of the challenging objectives for any country regarding comprehensive defense policies. Mongolian defense law declares "the basis of Mongolian defense policy is based on participation of government entities and all citizens."[24] Also, the law itself describes the Government of Mongolia as being tasked to train all citizens, as well as government entities, and non-governmental agencies to defend the nation. In this way, the existing defense policy is remarkably conventionally militarized, and the law does not include a psychological defense policy or stipulation for programs against disinformation, misinformation, fake news, and propaganda.[25]

This vulnerability is not without consequence. Indeed, Mongolia has been a "testing space" for misinformation and disinformation for other nations. According to an article in *Poynter*, Battsetseg Enkhtaivan, lead fact-checker of the Mongolian Fact-Checking Center, and her family encountered misinformation stating that "COVID-19 vaccines were just experimental Chinese treatments being tested on Mongolians without proper safety checks."[26] After hearing that misinformation her mother and sisters refused to get vaccinated, and they got sick with COVID-19. The article goes further by explaining that although "the practice and impacts of misinformation are not new to

Page 2667 of 3957

Mongolia, the concept can be difficult to translate for everyday people."[27] It is just one of the latest examples of misinformation in Mongolia, and it demonstrates that Mongolian social resilience has not fully developed. Part of the solution requires digital literacy education across all sectors of society.

Just as the NATO CDH outlined that the relevant learning audiences are divided into four groups, this thesis also proposes four groups of audiences within Mongolia: 1) youth; 2) government entities; 3) private and civic sectors; and 4) military and law enforcement agencies. These audience groups are described in the following sections.

A. YOUTH

The Mongolian population trends younger. As of 2019, "the proportion of children, adolescents and young adults was 35 percent."[28] As the future of Mongolia, the youth's social and psychological resilience education is a crucial part of comprehensive defense policy. Research suggests "Mongolian youth spend an average of 5–6 hours every day on social media,"[29] making them especially vulnerable to misinformation and disinformation. Therefore, investing in digital literacy programs is key.

Like other successful digital literacy efforts, it is critical to educate youth "to explore digital safety, digital privacy, digital presence, online communication."[30] Notably, Finland and Taiwan have focused on media literacy for youth, and the primary education system in those countries includes relevant training on media literacy. These efforts include the Taiwanese *Curriculum Guidelines of 12-Year Basic Education* (since 2014), which teaches students "to effectively use technology, information, and media of all types, develop competencies related to ethics and media literacy, and develop the ability to analyze, speculate about, and criticize human's relationships with technology,

Page 2668 of 3957

information, and media."[31] In a 2019 study of Europe, Finland ranked first in media literacy.[32] Mongolian primary schools, and even more importantly, Mongolian universities and colleges did not have this kind of program in their curriculums until most recently. Hence, many youths have become victims of misinformation and crimes on social media due to a lack of media literacy educations.

Out of necessity, the Mongolian National Police has conducted a nationwide campaign called the "unfriend" movement on Facebook to protect teenagers from cybercrimes and abuses. As a result, parents strengthened control over children's use of social media, and the campaign urged social media users to prevent potential risks. Thus, it is considered an effective campaign oriented not only to improving teenagers' media literacy but also that of most Mongolians who have now obtained basic knowledge about the risks associated with social media platforms.

Mongolian youth are the driving force of next generation; thus, they should have comprehensive and solid education on psychological resilience. To start with, media literacy education should begin in secondary schools for teens and those education programs can be designed and delivered in conjunction with expert NGOs. For example, the Mongolian Fact-Checking Center could cooperate with schools and expand their practice across Mongolia. What is more, the governmental and non-governmental organizations can engage with teenagers in boy scouts, sport communities, clubs for life skills, science and health associations, and book clubs regarding how to spot fake news on social media platforms. For instance, Lut-Ochir Vanganjil is an active member of the National Network for Media and Information Literacy in Mongolia and is enthusiastic about sharing the critical use of media and information among children and youths. "Together with his colleagues and fellow members of the national network, Lutaa produced and disseminated 17 video tutorials in 2020, to provide knowledge on essential topics related to access to information, critical and responsible use of information, as well

as evaluation of information."[33] His initiative was supported by UNESCO and made significant progress in the last two years in Mongolia.

In addition, the Ministry of Education and Science, the Communications and Information Technology Authority (CITA), and 'Faro Foundation Mongolia' (an NGO) agreed to jointly organize in collaboration with Facebook a series of webinars, training, and content on digital literacy, and involve 10,000 people in 2021. The program is labeled "We Think Digital Mongolia" and "aims to teach people how to navigate their privileges and obligations in today's evolving digital space, how they should decipher and share information online, and most importantly, how they should interact with other people in online communities."[34]

B. GOVERNMENT ENTITIES

The Government of Mongolia's five-year mission to build a digital nation is worth noting. A digital nation's mission objectives are to enhance the information technology (IT) industry and digital literacy, as well as highlight personal data protection and cybersecurity issues. For instance, "to support the Government of Mongolia's commitment to become a digital nation, the Accelerator Lab is working with the Communication and Information Technology Authority to develop a National Program on supporting the digital skills and education."[35] Nevertheless, this program "focuses on specific activities to improve the digital access, fill in the digital literacy gaps of the vulnerable groups including people with disabilities, elderly, rural and low-income households",[36] it's a good start.

At present, the Government of Mongolia does not have an agency or organization to address damaging misinformation or disinformation such as the Taiwanese

Page 2670 of 3957

Disinformation Coordination Team, whose mission "includes drafting policies, interacting with major social media platforms, and leading interagency discussion such as the Ministry of Justice, the Ministry of Education, the Ministry of Interior, the National Communication Commission, to name a few."[37] Dulamkhorloo Baatar, founder and editor-in-chief of the Mongolian Fact-Checking Center has mentioned that "we don't have a Mongolian word for (misinformation), and when you mistranslate that, it has a negative impact on the awareness-raising we're trying to do."[38]

The Government of Mongolia is establishing the Ministry of Cyber and Cyber Academia in Mongolia in 2022 to educate and train personnel of the national agencies and civic organizations as well as citizens. That effort is needed to bolster agencies' interoperability, especially for the subject of social resilience. This challenging effort is made even more difficult by a disengagement between the experts and policymakers who develop nationwide projects and programs. According to the study "Assessing E-Resilience in Kazakhstan, Kyrgyzstan and Mongolia," "in the case of Mongolia, expanded investments and support for fixed broadband may be required to achieve advanced e-resilience and e-readiness of terrestrial networks."[39] The assessment goes further by suggesting "policymakers can consider the following factors: policy regime; regulatory framework; regular trainings for experts; national projects; funding system; and public events or campaign."[40] Compared with other government entities of Mongolia, the Ministry of Defense and the Ministry of Justice and Interior Affairs pay more attention to national and social resilience nationwide. Thus, those two ministries might be good choices to lead social resilience education programs, along with other government agencies in Mongolia. As the NATO CDH emphasized, "education programs are not intended to simply inform decisions or encourage support, but instead to impart

Page 2671 of 3957

knowledge that stakeholders can translate into tangible skills and action."[41] Furthermore, education programs can take the form of situation-based table-top exercises, open seminars with foreign experts, and subject-matter expert exchange programs with other nations. Table-top exercises may sound like a military method, but exercises can be one of the efficient educational program formats for civilian participants who do not already have national level resilience. "Table-top exercises are discussion-based sessions where team members meet in an informal, classroom setting to discuss their roles during an emergency and their responses to a particular emergency situation."[42] Also, those exercises are low-cost but highly effective for assessing emergency plans, responses, and more importantly, clarifying roles and responsibilities for other civilian government entities. For example, "Gobi Wolf," the disaster management table-top exercise, is "aimed at enhancing abilities to respond and recover from emergency situations, disasters and hazards that occur in Mongolia, training corresponding disaster and emergency personnel and sharing experiences with experts of other countries."[43] The main purpose of this exercise was a wider understanding of the concept of crisis management by all agencies and organizations across all levels of government.

C. PRIVATE AND CIVIC SECTORS

As the NATO's CDH stressed, "achieving military and civil preparedness in comprehensive defense requires close collaboration across all sectors of society."[44] Furthermore, "the majority of the population is contained in the two non-governmental categories, the private and civic sectors, sometimes referred to as the 98% of society."[45] After the Warsaw Summit of 2016, NATO member states decided "civil preparedness is a central pillar of Allies' resilience and a critical enabler for Alliance collective

44 NATO Special Operations Headquarters, 20.

45 NATO Special Operations Headquarters, 11.

defense."[46] Accordingly, NATO military forces count on civilian assets such as transportation and communications in peacetime and crises situations. Those actions will strengthen collaboration between civil-military and civic-government relationships. Although Mongolia is not a member of NATO, civil preparedness is the main contributor in matters of national resilience even in non-member countries. In this regard, "a renewed effort to broaden and strengthen pro-democratic values and civic education through a range of educational and other civil society organizations is necessary."[47]

The government's effort to strengthen social resilience across the nation has mostly failed the emerging civic-government partnership. On top of that, institutionalized collaboration among the government entities, civic organizations, and the private sector is not fully functional in Mongolia. Compared to other countries, the inadequate civic-government partnership was exposed more than ever during the COVID-19 pandemic in Mongolia. As a result, some civilian NGOs refused to support the government enforcement of vaccinations, and similarly, many private companies went out of business due to the lack of government support for them. In general, the Government of Mongolia is losing the trust of people in all sectors.

It should be emphasized that educating every member of society for whole-of-society defense policies in democratic countries is often difficult to accomplish. More precisely, "with the exception of conscription, members of the private and civic sectors cannot be compelled to participate in defense training beyond that which is included in the nation's public education curriculum or laws governing business."[48] Under such conditions, it is important to consider using all possible education delivery programs to reach the civic and private sectors. In fact, "the civic sector will decide what course the nation follow";[49] thus, "they can communicate their position explicitly, through various

---

47 J.D. Maddox, Casi Gentzel, and Adela Levis, *Toward a Whole-of-Society Framework for Countering Disinformation* (New York: Modern War Institute at West Point, October 2021), https://mwi.usma.edu/toward-a-whole-of-society-framework-for-countering-disinformation/.

48 NATO Special Operations Headquarters, *NATO Comprehensive Defense Handbook*, 51.

49 NATO Special Operations Headquarters, 102.

formal mechanisms, or implicitly by demonstrating disinterest."[50] Consequently, a strong partnership with the civic sector is a key factor in building psychological resilience.

A "civic-government partnership" could be designed for social resilience as follows. First, enhance or promote civic sectors nationwide, including NGOs such as Mongolian Fact-Checking Center (MFC). Even though the Government of Mongolia cannot afford to provide this kind of support and promotion of policies for civic organizations at this moment, it can be one of the areas for collaboration between the government and civic sectors in coming years. For instance, the Communication and Information Technology Authority (CITA) is the regulatory agency of the Government of Mongolia, and the organization itself can enhance and promote any digital literacy education programs in the civic sector. More specifically, CITA can support Mongolian Fact-Checking Center activities on behalf of the government and help expand their practice across the country. According to the MFC, they "train some of Mongolia's 500 media organizations in basic fact-checking"[51] by themselves, and if CITA supports it, those numbers could be doubled. In addition, International Fact-Checking Network certification will enable MFC to team up with social media platforms such as Facebook and Twitter so MFC could work as a bridge between the government and those social media platforms. Nevertheless, collaboration with social media platforms has limitations, and it requires a certain degree of cooperation. According to experts, the Taiwanese Fact-Checking Center is regarded as a pioneer center among other nations. Dr. Yuan-Hui Hu, one of its founders, describes is purpose in these terms: "we are not asking a platform to act as the 'arbiter of truth' who 'controls the content of speech' but rather to be a 'basic online garbage janitor' who cleans up harmful contents."[52]

Taking everything into consideration, if the government takes steps to enhance and promote the private and civic sectors, it does not mean they work as the government's mouthpiece. In terms of enhancing and promoting the civic sector, the

---

[51] Mantas, "The Mongolian Fact Checking Center."

[52] Kao, "Taiwan's Response to Disinformation: A Model for Coordination to Counter a Complicated Threat," 15.

government would make certain decisions/policies to promote the civic sector and support it in all means, while the civic sector maintains its distance from the government and works independent of the government. For instance, the Mongolian NGO law promulgated in 1997 defined NGOs as "not-for-profit, self-governing organizations operating independently from the state and established voluntarily by citizens or by legal persons other than state legislative, executive, and judicial bodies, on the basis of their individual or social interests and opinions."[53] This law focuses on the legal status and the activities of NGOs. But the law itself does not include government support for and cooperation with NGOs. Hence, Mongolian laws and policies regarding the civic and private sectors need to be updated and streamlined, but not at the expense of ensuring the essential freedoms of assembly and open expression.

Second, the government needs to design and promote intensive educational programs on social resilience for NGOs, clubs, civic groups, and private companies. Those programs must focus nationwide, with particular attention on emerging civil societies and private companies and must be conducted by either governmental (such as CITA) or non-governmental organizations (for instance, the MFC). There have been many civil society organizations such as NGOs, clubs, and community groups in Mongolia, not all of them have worked actively. For example, the most well-known and active NGOs are the Mongolian Youth Federation, the Mongolian Women's Federation, the Mongolian Elders Association, the Mongolian National Federation of Disabled People's Organizations, and the Mongolian National Olympic Committee, etc. In general, those NGOs have higher capital, human resources, and also have networks of offices nationwide. Therefore, intensive educational programs need to develop and adjust with those civic organizations. When it comes to the private sector, the economy of Mongolia is attached to agriculture, mining, and construction. Therefore, these areas are considered as the most prominent and influential among other private industries. In fact, "opinions and interests will vary widely among members of the private sectors."[54] So, social

---

[53] "Төрийн бус байгууллагын тухай" Монгол Улсын хууль, [Non-Governmental Organization Law], The State Great Khural - Parliament of Mongolia, January 31, 1997, https://legalinfo.mn/mn/detail/494.

[54] NATO Special Operations Headquarters, *NATO Comprehensive Defense Handbook*, 103.

resilience education "cannot be tailored to every company, or even every type of company, but as many interests as possible should be accounted for when seeking support."[55] Finally, education programs for the civic and private sectors are most important because "the social and psychological pillar within the comprehensive defense framework further reinforces social harmony and civic responsibility."[56]

D. MILITARY AND LAW ENFORCEMENT AGENCIES

While the Armed Forces of Mongolia enhances defense force readiness, it fails to deal with unconventional or hybrid warfare from external sources, namely in the information and cyber domain. The Government of Mongolia has passed the bill for the establishment of Cyber and Special Forces Command in 2020, through which the Cyber command would deal with all kinds of cyber issues including disinformation and misinformation. But the command is only dedicated to Armed Forces (conventional and special forces) service members. Therefore, psychological resilience education programs can be situation-based table-top exercises, open seminars that involve other law enforcement agencies such as Border troops, the National Emergency Management Agency (NEMA), National Police and Intelligence services, and subject-matter expert exchange programs with other nations. Compared to civilians, uniformed service members have established many regulations, norms, and codes of conduct related to social media or information exchange in the digital domain. Consequently, their education programs should focus more on security awareness regarding disinformation, weaponized information, subjects of cyber and operation security.

IV. INFORMATION

> Social media has created a historical shift from the historically powerful to the historically powerless. Now everyone has a voice.
>
> —Facebook COO Sheryl Sandberg

A. SOCIAL MEDIA VULNERABILITIES

As the nature of modern warfare changes, so too does the way nations strategize and operate across the spectrum of conflict and competition. This has become increasingly complex in the present information era where we continue to see rapid technological developments in the information warfare space. In the case of Mongolia, the two powerful states on its northern and southern borders are highly advanced actors in the area of social media capability. As a result, Mongolia is technically highly vulnerable to coercive influence. However, for over a hundred years, in its role as a geographic buffer state, Mongolia has served a very useful purpose for both Russia and China. Mongolia does not threaten its neighbors and generally pursues a policy of neutrality. However, as China's power increases, and tensions between Russia and the West rise, it is a prudent policy for Mongolia to strengthen its resilience to malign influence from other actors in cyberspace.

Freedom of information is a foundational principle in democratic societies. Like other democratic countries, the Government of Mongolia does not control its domestic information environment. It upholds the principles of information freedom. Indeed, Mongolian national security policies encourage the "continuity of the Mongolian state governance and national unity, support for political parties, civil society, free press and media, individual liberties as well as safeguarding public order and social stability."[57] While it is a valuable democratic freedom, by promoting inclusive individual liberties,

---

57 "National Security Concept of Mongolia," Ministry of Foreign Affairs of Mongolia, (November 2015) https://mfa.gov.mn/en/documentation/55280/.

Page 2677 of 3957

"democracies are more vulnerable to weaponized information,"[58] which is defined as "a message or content piece that is designed to affect the recipient's perception about something or someone in a way that is not warranted."[59] Of note, not all the weaponized information is false. Some information can be true, but the timing of release or targeting of people can be harmful. For instance, a 13-year-old Mongolian girl who was studying in a high school in South Korea was beaten for six hours by four Korean female high school students, forced to drink alcohol, and locked in a room. "Two of the assailants were handed over to the prosecution on charges of gang violence, but the others were juveniles … under the age of 14; therefore, they escaped criminal punishment."[60] The incident happened in July 2021 in South Korea, but the news reached Mongolia in late November 2021 and triggered a mass anti-Korean movement on social media. This incident also garnered misinformation on Facebook—a fake picture of the Mongolian girl was shared by 200,000 people and had over a million views.

---

[60] "Four Teenage Girls Assaulted a Mongolian Girl for Six Hours with Her Hands and Legs Tied up," Allkpop, November 2021, https://www.allkpop.com/article/2021/12/tw-cw-four-teenage-girls-assaulted-a-mongolian-girl-for-six-hours-with-her-hands-and-legs-tied-up.

Figure 1. Example of Misinformation, a Fake Picture of Mongolian Allegedly Victimized in South Korea in 2021.[61]

In reality, the girl in the picture is not a victim in South Korea; this fake picture was created by someone intentionally. Nevertheless, this misinformation strengthened the spread of the news all over Mongolia. As a result, the mass response on social media impacted South Korea and Mongolian diplomatic ties and prompted national government-level discussion. The incident serves as a powerful example of how social media news significantly influenced the Mongolian population nationwide.

B. EXISTING POLITICAL DEBATES

Though Mongolia enjoys a democratic system of governance, this system does not work as smoothly in Mongolia as it does in other democratic countries. Part of the reason for this is historical. After a bloodless revolution in 1990, multiple parties entered the Mongolian political system, but only the two dominant parties debated with each other in the last 30 years. The Mongolian People's Party (MPP, left-wing) and

[61] Source: "Mongolian Victim Was Beaten for 6 hours, but the Other Side Was Denied and Tried to Evade Punishment," *Monopolnews*, accessed November 28, 2021, https://monopolnews.com/5230/.

Democratic Party (DP, right-wing) are the two powerful political parties that hold influence nationwide, usually holding power alternately at government and parliament levels. Moreover, the Mongolian people's voting tendencies are not stable in each election session; political support tends to shift between the two parties. For instance, in the last parliamentary election (2020), the MPP won 62 out of 76 seats in parliament,[62] and with the large majority of parliament, MPP determines the government policies. Then again, Mongolian people were divided into two groups as usual—supporters and opponents of the government. There is no doubt that this kind of existing political debate will continue as long as two dominant parties hold so much influence over the Mongolian population. To sum up, the relentless political division negatively impacts the information environment undesirably. This strong rivalry influences the press and social media, and some politicians use these avenues as weapons to influence to the mass population.

C. PRESS

After the successful establishment of a democratic system in Mongolia in 1990, freedom of speech and of the press is guaranteed in the national constitution. Consequently, enhancing the independence and diversity of the media, educating the professionals, and fact-checking the press are a particularly crucial priority to Mongolia. Domestic press organizations play significant roles in social and psychological resilience. Namely, it is essential to any nation to "promote journalistic standards to safeguard independent, fact-based, investigative journalism and establish and bolster fact-checking standards and norms."[63]

At this time, Mongolia, as a small nation has over 500 officially registered press organizations, and Mongolia was ranked 68th out of 180 countries in the Reporters

Page 2680 of 3957

without Borders' "2021 World Press Freedom Index."[64] Based on the Resistance Operating Concept, one promising way to counter misleading information and external influences while building psychological resilience is by a "public diplomacy campaign using truthful and independent media."[65] Reliable media sources can clarify current concerns and expose issues while bolstering national psychological resilience.

Compared to other countries in the region, Mongolia has some minor issues with the press. Essentially, the Mongolian press is inadequate on fact-checking or verification of any information. Thus, media or press may amplify misleading information such as disinformation (which represents "deliberate creation and dissemination of false and/or manipulated information with the intent to deceive and/or mislead"[66]), misinformation ("false or misleading information spread without the intention to deceive"[67]), and fake news. For example, the press provided misinformation when Mongolian peacekeepers returned from a UN peacekeeping mission in South Sudan in late November 2021. Specifically, some press outlets titled the news as "Mongolian peacekeepers come from South Africa," which caused mass panic and fear on social media due to South Africa's noticeable new Covid-19 (omicron) cases just discovered at the same time. Consider another example of the press disinforming the public through Mongol TV. They distributed fake news regarding McDonald's opening a branch in the country in 2013 even though there had not been any discussion about McDonald's opening a branch in Mongolia, and it never did. The planted disinformation was picked up and disseminated by nine major media outlets due to payments they received, and none of them verified the information for themselves. Nomin Chinbat (at present, the Minister of Culture), head of

Mongol TV, emphasizes "They won't check the facts, they'll just be interested in getting paid to run the story."[68]

D. COUNTERMEASURES AND MONGOLIAN EXPOSURES

There are those who argue that "false news spreads more than the truth because humans, not robots, are more likely to spread it."[69] In practice, the misleading information spreads throughout social media, which is then amplified by unknowing digital participants and popular social influencers who do not check the validity of the news. This kind of misleading information threatens one of the pillars of comprehensive defense: social and psychological resilience.

To mitigate this threat, some Western countries have developed approaches to counter misleading information. First, some NATO member states have adopted laws within their legal framework and set up countermeasures to address the spread of misleading information. For example, Germany adopted the Network Enforcement Act in 2017 which made "more than two million users liable for fines of up to €50 million for the failure to delete 'obviously illegal' content within 24 hours of its publication."[70] According to experts, effective building of resilience is not only focused on digital literacy, but also to "continue to pursue policy and regulation of the commercial sector with regard to protection of citizens' privacy."[71]

Currently, Mongolia has not adopted laws or regulations to guard against misleading information, except one part of the criminal law of Mongolia emphasizes the penalty of spreading fake information. The legal penalty for spreading fake information is not robust enough. It is worth mentioning the law itself does not define the term "fake information" and does not classify misleading information such as disinformation and

[71] Kane, "Defense against Weaponized Information: A Human Problem, Not Just a Technical One," 60.

misinformation. In addition, the law itself does not address overseas hostile information activities. While the digital nation is appealing in Mongolia, it is also important to bolster the legal bases against spreading misleading and other malicious information. In addition, national law enforcement agencies should "strive to regain and retain the initiative in the information environment"[72] to maintain the national society's stability.

Adopting domestic laws and regulations against the dissemination of misleading information is not generally accepted in Western countries due to freedom of expression, yet some democratic nations are shifting in this direction. For instance, the Latvian Ministry of Culture has initiated financial support (since 2017) for "investigative journalism, deconstruction of lies, development of media literacy, media criticism, support for regional media, and a communication campaign called 'Media are not comedy' against the dissemination of disinformation."[73] These two approaches of Western countries to stop the spread of misleading information illustrate efforts that Mongolia could adopt to address its vulnerabilities in the information environment.

E. CIVIC-GOVERNMENT PARTNERSHIP ON INFORMATION

No single press organization and no simple solution can counter misleading information, and no country is immune from it. Like civic or private organizations, the press organizations prefer to keep a distance from government agencies to maintain their independence. Possibly the best way to understand the need for a whole-of-society framework for countering misleading information today is by understanding the cooperation and collaboration of governmental and non-governmental organizations, as well private and civic ones. Then, the Government of Mongolia should cooperate or collaborate with press organizations to combat misleading information by employing supportive policies or providing financial support. Like Latvia, the Mongolian Ministry of Education and the Ministry of Culture can promote and offer professional educational programs to journalists, focusing specifically on fact-checking information. In addition,

---

[72] Kane, 60.

[73] Klinta Ločmele, "Media literacy in Latvia: The Ministry of Culture's 6 strands," *Media and Learning* (January 2019), https://media-and-learning.eu/type/featured-articles/media-literacy-in-latvia-the-ministry-of-cultures-6-strands/.

government entities should only work on the development of professionals and should not curtail the freedom of expression and the independence of media.

Regarding the press-government relationship that usually does not work smoothly in any country, the Mongolian Press Institute is among the most important. The Press Institute has been "the leading non-government organization to work with journalists and media users to enhance the skills and knowledge of media in society and as a result, has contributed to the vibrant political, social and economic debate that exists in the public today."[74] Also, the Press Institute enjoys a successful collaboration with several international press and aid organizations, so the institute can bring experts from overseas to advise on how to combat misleading information. If the Government of Mongolia can establish a civic-government partnership with the Press Institute of Mongolia effectively, then the institute could work as a bridge between the government and Mongolia's press organizations. On the other hand, the Government of Mongolia can support and fund the creation of civic society organizations which counter misleading information through efforts like the Estonian website '*propastop'* or the Ukrainian website StopFake.

Based on open-source information, there is no evidence of a direct external threat operating in the Mongolian information environment, but information campaigns are happening overseas that could threaten Mongolia's information environment in the future. Mongolia has successfully walked tightrope for many years between its two powerful neighbors. It must continue to do so if it wishes to maintain its sovereignty. On one hand, Mongolia might benefit from increased Russian and Chinese economic and political ties by serving as a geographic transit sight for resources, goods and services between the two countries. However, greater involvement also comes with great risk. Mongolia can help mitigate that risk by enhancing the psychological resiliency of its population in the infosphere.

V. SOCIAL INCLUSION FOR YOUNG PEOPLE

Inclusion is not a matter of political correctness. It is the key to growth.

—Jesse Jackson

A. WHAT IS SOCIAL INCLUSION?

The concept of social inclusion is generally described as a society for all. The Government of Mongolia defines social inclusion as "expansion and creation of an equal access and opportunity to those disadvantaged social groups, especially individuals based on low income, age, gender, disability, ethnic minority, sexuality and geographical location who have limited access to social services and participation."[75] There is a common understanding that social inclusion is only related to individuals with disabilities or from ethnic or sexual minorities. Against this backdrop, social inclusion is simply defined as "the process of improving the terms of participation in society."[76] Thus, this research focuses on social inclusion that fosters youth participation in the whole of society. Greater social inclusion is critical to fostering resilience.

B. WHY IS IT IMPORTANT?

Mongolian youth are the future of Mongolia's existence in the Russian and Chinese geopolitical environment, and their participation in the whole of society is crucial. Under many circumstances, Mongolian youth (people aged 18–29 years) suffers from a series of problems such as unemployment, low incomes, and the breakdown of family in a rapidly modernizing society. For instance, the Mongolian youth unemployment rate has reached "43,5 percent among all unemployed,"[77] and since 2020

---

[77] Otgontugs Bayasgalan, "COVID-19 and Unemployment of the Youth," *Ikon,* February 9, 2021, https://ikon.mn/opinion/24i7.

it has been constantly increasing due to the COVID-19 induced economic crises. Therefore, the livelihood of many Mongolian young people depends on their parents' and grandparents' pension and other welfare assistance from the government. There are many reasons for youth unemployment such as "a lack of information on vacancies and requirements, high demands for collateral in employment contracts from some employers, and discrimination based on sex and age."[78] Moreover, youth unemployment renders the country "vulnerable to economic stresses, uninspired, and unable to innovate and contribute to Mongolia's economic growth."[79] Besides, the mass migration of youth from rural areas to urban areas (particularly to Ulaanbaatar city) is increasing as young people seek education and employment. Those young people who migrate from rural areas are compelled "to reside on the outskirts of the city in ger district, where poor service delivery contributes to air pollution, health problems, as well as high rates of alcoholism and gender-based violence."[80] These issues make young people disadvantaged group in society, and Mongolian youth are at risk of living lives of continued poverty and social exclusion. This factor undermines resilience and creates vulnerabilities for and comprehensive defense posture.

C. WHAT ARE THE CURRENT EFFORTS?

Many countries have a specific policy on their youth's social inclusion. It is essential to develop the younger generation to be independent by including their participation in decision-making processes at all levels of government with a positive mindset. Such policies focus on developing young people, educating them, providing them with a safe environment to live and work in, and ensuring healthcare wherever they may reside in urban or rural areas. In the context of burgeoning youth unemployment, the Government of Mongolia proposed various policies to target young people for employment, vocational-training programs, and enhancing employment information exchange programs. For example, the National Programme on Promotion of Youth

Page 2686 of 3957

Development promotes "basic training in business, management, marketing, legal and financial skills for youth and increasing the awareness of youth business incubation services."[81] This program does not only target government programs for the young but also includes policies for the private and civic sector organizations that employ youths.

Nevertheless, those policies are not addressing psychological and social factors in a manner similar to the European Union (EU). In late 2018 The Council of the European Union passed the resolution for "The EU Youth Strategy 2019–2027.," It promotes youth contribution in the democratic life. For example, the EU's Youth Strategy offers "new tools for mutual learning, such as peer reviews and peer counseling, high-level forums, analysis, and studies, following the priorities of the EU Youth Strategy at large."[82] Also, the strategy captured most of the key issues for youth, and the strategy itself emphasizes "positive change inspired by EU values and a European identity."[83] However, Mongolia has also taken action., The State Great Khural of Mongolia (parliament) implemented the "Vision-2050" long-term development policy of Mongolia in 2020. The policy itself fosters national identity, preserves traditional language and scripts, and acknowledges nomadic civilization as part of the national identity among the youth. A unified national identity is the foundation of social and psychological resilience. Without it, no comprehensive defense strategy can survive for long.

1. National Identity and Shared National Values

Why is national identity so important? David W. Johnson, of the Cooperative Learning Center at the University of Minnesota, stresses "a national identity unites and builds a bond among all members of the society."[84] Hence, the participation of youth in nation-building or decision-making processes is important to any nation. The Mongolian policy document "Vision-2050" emphasizes the need to "educate the entire population

with 'the mother tongue, the history and the heritage' based on solid facts, and develop shared values that will be the pillar to build a nation-state with a deep sense of national similarities/differences and resilience."[85] As a result, Mongolia would flourish as a nation with a deep-rooted sense of national identity and sharing common values by 2050.

What is Mongolian national identity? This question appeared with Mongolia's peaceful transition from a socialist to a democratic country, and the question remains unanswered. According to "Vision-2050," nomadic civilization is considered a part of the Mongolian national identity. Mongolians tried to settle the term "national identity" in many ways, but disputes are still ongoing. Some people argue that "Mongolian Blue Spot" (which refers to the "blue-gray spots and congenital dermal melanocytotic, the marks … often present at birth but [which] may also appear during the first weeks of life"[86]) is a part of national identity. But Mongolian blue spots do not happen only among Mongols and appear in many nations around the world. As William Bloom, occasional lecturer at the Department of International Relations, London School of Economics, suggested back in the 1990s, "the mass national public will mobilize when it perceives that national identity is threatened."[87] Neither nomadic civilization nor Mongolian blue spot would cause the mass of people to mobilize even if those factors were threatened in Mongolia. On the other hand, it is of primary importance to define the national identities of Mongolia and support them with firm policies such as "Vision-2050." Furthermore, Mendee Jargalsaikhan points out "accepting as a centerpiece in its national identity democratization, Mongolia has gained geopolitical balance and increased its capacity to affirm its distinctiveness versus China and Russia as well as Central Asian states or former Asian communist states (Laos, North Korea, and Vietnam)."[88] Dr. Mendee argues that Mongolian democracy is in the ranks of electoral democracies of the world

Page 2688 of 3957

beyond its expansionist neighbors. Against this backdrop, Jargalsaikhan Dambadarjaa (known as Jargal DeFacto), who is an independent economist and media representative of Mongolia, explains "the basic values of the Mongolian society are now democracy, human rights, and freedom."[89] Undoubtedly, if either democracy or human rights were threatened or violated in Mongolia, it could cause mass protests.

2. National Language and Script

From a subjective point of view, "national identity is based upon the sentiment of belonging to a specific nation, endowed with its own symbols, traditions, sacred places, ceremonies, heroes, history, culture and territory."[90] What this means is that each nation is distinctive in its traditional cultures, history, language, and script. According to the Pew Research Center survey, "language far and away is seen as the most critical to national identity."[91] Moreover, the survey stressed that "it is very important to speak the native language to be considered a true member of the nation."[92] Pew Research Center's Global Attitudes survey, conducted in 2016, involved 14 Western countries. Like other Asian countries, Mongolians are struggling to promote their traditional national language and script since the fall of the Soviet Union. The Mongolian language is part of a family within the Altaic language group and is used not only by Mongolians but also in the autonomous regions of Inner Mongolia, the PRC, and the Russian Far East (in particular, among the Buryat and Kalmykia ethnic groups). Mongolia's long history with its language has never been smooth. Specifically, the traditional Mongolian script (written in vertical lines top-down) faded away, "while under Soviet influence, Mongolia adopted the Cyrillic alphabet in 1941, which it uses to this day."[93] Cyrillic has been the standard script for official communications for decades, and nowadays, the Mongolian national

script has become almost an ancient script. As result, most Mongolians are poor at reading the traditional script, and while the young learn to read and write it in school, it plays only a small part in modern life. In addition, the old script contains many idiosyncratic spellings that varied to make it harder to read and write. For example, the city of Ulaanbaatar is written the same in English, but "the traditional script writes it as Ulaganbagator."[94]

In 2020, the Government of Mongolia declared "plans to restore the use of its traditional alphabet by 2025, replacing the Cyrillic script adopted under the Soviets,"[95] following the shift in other Central Asian countries such as Kazakhstan, Uzbekistan, and Turkmenistan. To that end, "Vision-2050" confirmed as one of its objectives the need to "incorporate the Mongolian language and script into national values and foster its proficiency and use by every citizen."[96] The decision, however, faced much criticism from the population, but young people, especially, are welcoming the change. An incident happened in Inner Mongolia in September 2020 that strengthened the government's decision in Mongolia. Thousands of ethnic Mongolians protested in Inner Mongolia, which is part of the PRC, against replacing the Mongolian language with Mandarin Chinese in schools. The *Guardian* emphasized "the official explanation for the change to a bilingual education system was to ensure the curriculum and textbooks were of a high standard, and that government documents cited by analysts also referred to President Xi Jinping's push for shared language as part of a common identity."[97] However, the Inner Mongolian objection to the PRC's proposal triggered social media movements in Mongolia expressing anti-China sentiments and calling to "Save the Mongolian language," and it also fostered Mongolian youth's nationalism. Since then, many Mongolians understand why the Mongolian national script is important, and the

Government of Mongolia promotes some policies that focus on boosting traditional literacy among the young. For instance, "Foremost Traditional Script Writers of Mongolia" is a popular contest conducted annually that attracts participants of all ages. Over 1,500 participants sent their works to the annual contest in 2021, and the Minister of Education and Science, Enkh-Amgalan Luvsantseren, participated and delivered remarks at the award ceremony. Mr. Enkh-Amgalan emphasized, "the Mongolian traditional script is a guarantee for national security, and we have an utmost important duty to protect the culture and history written in Mongolian traditional script as a cultural heritage of humankind and to pass it down to the next generation."[98] That was an indication of Mongolia's progress in preserving this area of national identity. This increased interest and involvement in the traditional Mongolian script is a significant potential source of psychological resilience.

3. Mongolia and Nomadic Lifestyles

Nomadism is defined as the "way of life of peoples who do not live continually in the same place but move cyclically or periodically."[99] Long after the supremacy of Genghis Khan, nomadism remained a way of life that continues in modern Mongolia as it does in Kazakhstan and Kyrgyzstan. Nomad ideology has emerged to become "a strong pillar of Mongolian national identity, [and] it has also divided the Mongol population into distinct groups not only within the present borders of Mongolia, but also in the surrounding territories of Central Asia."[100] Mass migration from rural areas to cities has been increasing since the 1990s due to many reasons, and consequently, one-third of the population now lives in urban areas. In the rural areas, there is little opportunity for economic activities that would maintain a household's livelihood at a decent level, except for herding. Today, the Mongolians have increasingly adapted to globalized cultures. The youth find these cultures appealing, especially the South Korean or a Western lifestyle,

and urban daily life makes the young willing to dispense with nomadic traditions. Moreover, challenges such as climate change and natural threats such as zuds (an extreme winter), drought, dust storms, earthquakes, and fires (forest and steppe) cause young people to leave rural areas. On the other hand, the Mongolian mindset has changed in recent years, and urban life has been viewed as the only way to live in the modern world. In fact, "Mongolian intellectuals for generations have been taught to regard the herders' life as non-progressive, old-fashioned, even though the repository of Mongolian heritage."[101]

Due to air pollution in Ulaanbaatar city and mass migration to an urban area, the Government of Mongolia is making some attempts to develop rural areas and support nomadic lifestyles as part of the national heritage and as a tourist attraction. For example, "Vision-2050" is aiming to position Mongolia to "become a leading country with preserved nomadic civilization, based on national mentality, heritage, culture, and mindset, and centered on the creative Mongolian citizen."[102] The policy will adapt to the conveniences of modern society while keeping an ancient and fascinating lifestyle alive. Migrating from an urban to a rural area is challenging for young people, and it requires strong motivation. The policy will require significant investment in providing robust support to herders, particularly during harsh winters, connecting the nomadic lifestyle. There have been some cases of young people migrating from "the opposite" direction. For instance, Batbayar "Baavar," the President of the Mongolian Hip-hop Association, moved to the countryside with his family in 2019, and his family now lives in the northern part of Mongolia. Mr. Baavar once emphasized "Living in the countryside is wonderful and challenging,"[103] which inspires many young people on social media today.

VI. CONCLUSION AND RECOMMENDATIONS

Victory comes from finding opportunities in problems.

—Sun Tzu

The survival of small democratic nations bordered by superpowers requires constant vigilance, especially as the nature of warfare evolves. Warfare is not limited to the physical domain; it increasingly cuts across psychological and social frameworks as well. Mongolian national defense policies have relied on conventional military capacity for decades, but those policies never included psychological and social preparation against any external influences. This thesis has examined three lines of effort to develop and maintain Mongolia's social and psychological resilience capacities as part of its national defense strategy. Notably, Mongolia must sustain and develop strategic partnerships with its neighbors and enhance its military-to-military cooperation.

Building psychological and social resilience is one of the core pillars of NATO's comprehensive defense posture. Comprehensive defense policies have been based on total defense strategies from Western Europe during the Cold War period and have not been tested since then. Many countries such as the Nordic states (Norway, Finland, and Sweden) and Taiwan are currently applying comprehensive defense policies. Those countries have some similarities with Mongolia such as conscription (mandatory military service), small populations, and borders with superpowers and therefore provide useful insights into the development of Mongolia's comprehensive defense strategic efforts.

Mongolia, a small nation, is located in a significant geopolitical environment. Failing to invest in social and psychological resilience now puts Mongolia at risk, as has been observed elsewhere. Consider Kazakhstan's unrest in January 2022 as an example. The International Crisis Group summarizes Kazakhstan unrest as resulting from "economic stagnation, a sharp rise in predatory consumer debt, rising internal migration, the pandemic, increasing protests and widening inequality," which means that "weakened

Page 2693 of 3957

institutions faced significant tests."[104] Authorities in Kazakhstan accused protesters of being "terrorists," "bandits," and "foreigner mercenaries," but those claims were not confirmed officially. According to an Al Jazeera interview, "the main group of protesters—young unemployed people from the regions expressing their frustrations against injustice,"[105] were manipulated by social media and social influencers. Those unemployed youth were victims of information and psychological operations, and many of them ended up in prison. A very similar situation arose in Mongolia in 2008, when "police arrested over 700 people on the night of 1 and 2 July,"[106] an action that resulted in the deaths of five young people. In addition, the current Russian-Ukrainian conflict confirms that military objectives aim not only at the military in combat but also at civilians back home. For example, during this conflict, "military propagandists delivered false and demoralizing messages to Ukrainian soldiers at the front and their family members back home via cyber-electromagnetic means."[107] These incidents demonstrate just how crucial psychological and social resilience is in today's world.

When it comes to Mongolia, the current defense law states that defense policy relies on the participation of government entities and all citizens. But the law fails to include participants from the private and civic sectors as the asymmetric defense component. This is the gap where Mongolia should understand, and consider, the concept of the NATO CDH by strengthening integrated layered defense policies. It takes time to change conventional defense posture within the whole-of-government approach as a comprehensive defense. A critical first step of this approach is to bolster social and psychological resilience. Thus, the following recommendations could improve and provide support for the psychological resilience of Mongolia.

A. RECOMMENDATIONS

To invest in Mongolia's comprehensive defense strategy, this thesis provides three recommendations for building psychological resilience in Mongolia.

1. A persistent national information campaign, initiated and conducted by the Government of Mongolia in cooperation with civil society and NGOs, would make Mongolians aware of the comprehensive defense concept

Compared to neighboring states, the Mongolian economy, population, and military are relatively small, and there is no direct threat currently. There are, however, many indirect threats that could escalate. For example, a recent case of Beijing's new policy replacing the Mongolian language with the Mandarin Chinese language in Inner Mongolia triggered a protest in Mongolia. The main concern of the Mongol people was "if the traditional written language dies in Inner Mongolia, it would be a massive loss of identity for all the Mongols around the world."[108] As described by the CDH, understanding the strategy is not only for decision-making politicians and military personnel, but requires awareness and participation across all sectors of society. This means that Mongolian citizens should be aware of current and potential future threats to its democratic values.

But the world is changing day by day, and citizens of Mongolia need to be prepared for potential future threats, especially in terms of psychological and social resilience. Today, some malicious acts threaten the safety, security, and sovereignty of superpowers and small nations equally. For example, the Russian disinformation campaign against the U.S. election in 2016 was a significant surprise to the world. That example demonstrates that no country can afford to lack psychological and social resilience in the information era. Such a threat requires that every member of society get a basic knowledge of psychological resilience.

There are already frameworks in place that the Government of Mongolia could adapt for the purpose of education and information. Furthermore, the Government of Mongolia could start by "establishing online and public media-based training and

Page 2695 of 3957

information programs"[109] to promote digital literacy. One example of how this is already being accomplished is Mongolian CITA establishing the "Information Technology Center" in 2022 "to improve citizens' digital literacy skills and enable youth to have the skills to use modern technologies."[110]

Specifically, programs that exist for disaster response and prevention can translate to responses for national security crises. These programs extend nationwide and are not difficult to set up. For example, Sweden's "If Crisis or War Comes"[111] contains information about how to respond to natural disasters and malicious acts (such as disinformation, terrorism, physical occupation). Moreover, the National Emergency Management Agency (NEMA) has successfully established early warning systems nationwide in Mongolia through the media, internet, national radio, and communication companies to alert the public to potential storms and flooding (see Figure 2).

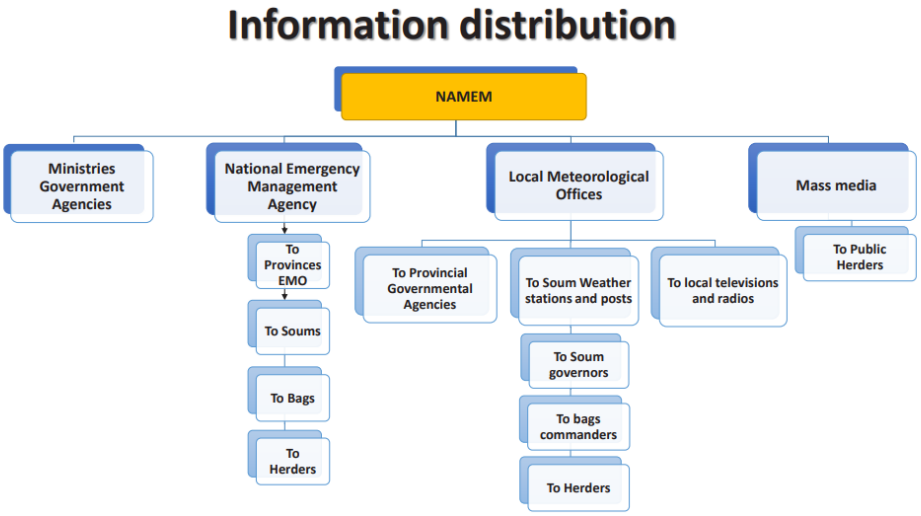

Figure 2. Flood and Storm Warning Information Distribution[112]

The way information flow is as follows. It begins with Mongolia's National Agency of Meteorology and Environmental Monitoring (NAMEM) and is "disseminated down though the ministries, NEMA, local meteorological offices and through mass media until it makes it was to the herders."[113] This system and structure could also work for disseminating accurate information that may affect national security.

2. A basic education curriculum in elementary and high school should include digital literacy

Section IV of this thesis examined social media vulnerabilities in Mongolia, and these vulnerabilities require a long-term solution. As Section IV mentioned, there is no distinction between "disinformation" and "misinformation" in Mongolia. At this time, Mongolia does not have rock-solid laws or regulations against misleading information or online phishing matters. The misleading information includes not only internal matters in Mongolia, but some information that comes from overseas. Chapters II and III of the thesis covered case studies on misleading information in Mongolia, and it is not going to be stopped in the future.

The Government of Mongolia is enhancing adult education and professional development in certain areas, but this education is not good enough to target the whole of society. Teenagers, youth, and older people are still at risk of being manipulated by misleading information. Therefore, digital or media literacy programs should be included in elementary schools' educational curricula as is done in Taiwan and Finland. In addition, fact-checking norms and digital literacy are essential skills to the student who studies journalists for the press personnel capacity building and professionalism. It's commonly known that media always plays a considerable role in social and psychological resilience. This is not a quick-fix issue but will take some time.

[113] Mongolia Disaster Management Reference Handbook, 33.

Page 2697 of 3957

3. Mongolia should promote civil society organizations and enhance their capabilities

According to Mercy Corps, "Mongolia's civil society sector is still small and focuses primarily on environmental and child welfare issues."[114] In fact, civil society organizations are inadequate due to the legal framework that constrains their activities. Furthermore, as Mercy Corps emphasized, "an enabling environment for resilience and development must be supported by citizen demand for good governance through civic engagement and collective action."[115] Consequently, the Government of Mongolia and its entities are hardly influenced by civil society organizations, and NGOs remain out of the circle of political decision-making processes. This is the space for the emerging civic-government partnership, and authorities should adapt proper legal frameworks. For example, the Mongolian Fact-Checking Center can collaborate with the government on media literacy education for the young or effective measures to counter misleading information. The Taiwanese FactCheck Center is considered a model for coordination with the government and to counter disinformation among other centers.

What is more, "targeting civic engagement efforts towards youth will be especially critical, as this helps cultivate a sense of agency and future purpose that underlies resilient individuals and communities."[116] Access to all kinds of information is inadequate, and only civic organizations tend to be effective at reaching and engaging youth. The government's policies on youth are not always as effective as those of civic organizations, and some countries use this opportunity to promote defense policies in creative ways—for example, the Norwegian NGO People and Defense provides "support for the armed forces and Norwegian defense policies"[117] by employing policies aimed at youth. Norwegian practice confirms Mercy Corps' conclusion that "strengthened social networks have been shown in many contexts to have a multiplier effect on inclusive

decision-making, civic engagement and an overall enabling environment that supports resilience."[118]

Similar to Norway, there used to be civic societies in Mongolia that supported the defense force during the Soviet era, called "Community for Defense Support."[119] That community consisted of various sports clubs such as parachuting, shooting, cross-country skiing, and wrestling. Most of the activities were dedicated to youth. The Government of Mongolia can promote such kinds of civic organizations to foster psychological resilience among the youth.

B. AREAS FOR FURTHER STUDY

Establishing a comprehensive defense is complicated, and it "requires all sectors of society to be capable of integrating into a single, coherent, multi-layered system."[120] An example of such a multi-layered system is shown in Figure 3. This thesis outlines education, information, and inclusion efforts to develop psychological resilience, highlighting instruments needed to contribute to comprehensive defense. Furthermore, it identified psychological resilience as a strong foundation for the resistance movement. The outcome of the ongoing conflict in the Ukraine should also be studied closely for potential lessons.

120 Source: NATO Comprehensive Defense Handbook, 33.

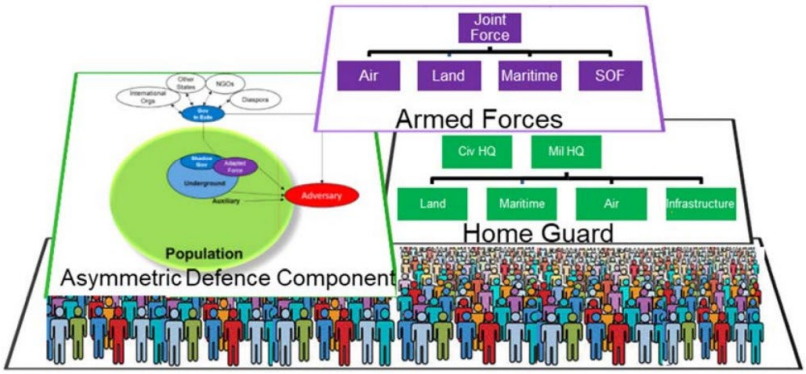

Figure 3. Integrated Layered Defense[121]

Therefore, the thesis focuses on resilience as "the first line of a multi-layered deterrence and response system,"[122] and primarily aims to strengthen asymmetric defense components. This means the thesis has not discussed the concern of the armed forces and home guards in comprehensive defense policies.

Future research should consider how the inclusion of the Mongolian Armed Forces (particularly the Special Forces Command) and Local Defense Forces (which are equivalent to the Home Guard shown in Figure 3) could contribute to comprehensive defense policies. The latter was established on June 27, 2018, when the Mongolian Parliament passed the law for the "Local Defense Force" (LDF), the purpose of which is to regulate local defense force relations aimed at establishing and strengthening the state defense system. Mongolia's new LDF is considered to be a paramilitary organization like the Swiss territorial service, Swedish home guard, and the U.S. National Guard. Given its close relationship with local populations, it can be a valuable bridge to the civic sector in developing a comprehensive defense policy.

The Psychology of (Dis)information: A Primer on Key Psychological Mechanisms

Heather Wolters, Kasey Stricklin, Neil Carey, and Megan K. McBride

DISTRIBUTION STATEMENT A. Approved for public release: distribution unlimited.

DRM-2021-U-029337-1Rev-2

Abstract

Disinformation is a growing national security concern with a primary impact occurring in the mind. This study explores the underlying psychological principles facilitating the absorption and spread of disinformation and outlines options for countering disinformation grounded in in cognitive and social psychological literature. The report serves as an introduction to the topic for policy- and defense-decision makers with no prior background in psychology or disinformation. It first examines what disinformation is and why it is important before turning to the four key psychological principles relevant to this topic. A key finding is that the principles themselves are neutral and normal cognitive processes that malign actors can exploit to achieve their own objectives.

13. SUPPLEMENTARY NOTES

14. ABSTRACT

Disinformation is a growing national security concern with a primary impact occurring in the mind. This study explores the underlying psychological principles facilitating the absorption and spread of disinformation and outlines options for countering disinformation grounded in in cognitive and social psychological literature. The report serves as an introduction to the topic for policy- and defense-decision makers with no prior background in psychology or disinformation. It first examines what disinformation is and why it is important before turning to the four key psychological principles relevant to this topic. A key finding is that the principles themselves are neutral and normal cognitive processes that malign actors can exploit to achieve their own objectives.

Executive Summary

The rise of disinformation

Disinformation, or the intentional creation and spread of false information, is a growing national security concern. While the use of information operations is not a new phenomenon—various actors have used them throughout history for a range of objectives—the connectivity that characterizes the world today allows both information and disinformation to spread faster and with a much greater reach. It is not surprising that a rapidly increasing number of adversaries and domestic US actors are coming to understand the utility of the information space for achieving their objectives and are seeking to weaponize it. The use of disinformation has led directly to real-world events and violence, can have a demonstrable impact on a recipient's behavior, and can lead its promulgators to achieve some goals simply through its existence, regardless of its believability. Because disinformation's primary impact occurs in the mind, technological, political, or military solutions alone cannot sufficiently mitigate the threat.

Psychological principles associated with disinformation spread

This report is the result of an extensive literature review across multiple domains, including disinformation, psychology, military science, foreign affairs, economics, computer science, and marketing. Through the literature review, we identified four key psychological principles related to the absorption and spread of disinformation: initial information processing; cognitive dissonance; the influence of groups, beliefs, and novelty; and the role of emotions and arousal. This report describes each psychological principle, explains how the principle contributes to the absorption and spread of disinformation, and details ways to mitigate the effect of the principle on the spread of disinformation.

A critical takeaway from the identification of these principles is that they are not unique to absorbing and spreading disinformation. These same principles are key to absorbing and spreading true information as well. Thus, at an individual level, it appears that disinformation is absorbed and spread through normal, routine, and adaptive mechanisms, which malign actors can exploit and manipulate for their own objectives. The four psychological principles we identified are:

Page 2714 of 3957

- **Initial information processing:** Our mental "processing capacity" is limited; we simply cannot deeply attend to all new information we encounter. Our brains take mental shortcuts to incorporate new information, and those shortcuts can open us up to mistakes. To the extent that we do not process information as deeply as we should, disinformation can be construed as true information.
- **Cognitive dissonance:** Cognitive dissonance describes the discomfort we feel when we are confronted with two competing ideas. We are motivated to reduce the dissonance by changing one attitude, removing (ignoring) the contradictory information, discounting the importance of contradictory information, or increasing the importance of compatible information. If disinformation supports our initial beliefs or creates less dissonance than true information, we are more likely to believe the disinformation.
- **Influence of group membership, beliefs, and novelty (the GBN model):** Not all information is equally valuable to individuals. Our group memberships, our beliefs, and the uniqueness of the information influence whether we absorb and share disinformation. We are more likely to share information with people we consider members of our group, when we believe the information is true, and when it is novel or urgent. If disinformation is coming from a group member with whom we identify, is consistent with our beliefs, or is new information for us, we are more likely to share it.
- **Role of emotion and arousal in our sharing of disinformation:** Just as not all information is equally valuable, not all information affects us the same way. Research demonstrates that we pay more attention to information that makes us feel positively or that arouses us to act. That means we are more likely to share information if we feel awe, amusement, or anxiety than if we feel sadness or contentment. Given that disinformation is, by definition, created by someone, it is more likely to be absorbed and shared if it is constructed to be emotional and arousing.

Countering the absorption and spread of disinformation

The research team identified several techniques in the literature that could be useful for countering disinformation absorption and spread. Two techniques to help counter disinformation were associated with more than one psychological principle: (1) preventive inoculation (i.e., warning people about the effects of disinformation and how to spot it) and (2) encouraging deeper, analytic thinking. The literature also details techniques that could combat the effects of a single psychological principle. For example, to counter the effects associated with groups, beliefs, and novelty, researchers recommend creating unique content that encourages individuals to identify with a broader "group" and increases their access to opposing information. In addition, researchers recommend that disinformation containment

Page 2715 of 3957

policies emphasize behavioral interventions aimed at countering the psychological principles activated by disinformation, rather than solely focusing on stopping the malicious use of bots, algorithms, and technologies. Before disinformation is shared, it is absorbed by an individual. Thus, interventions that disrupt how an individual absorbs disinformation should interrupt the chain between seeing disinformation and sharing it.

Introduction

On the morning of September 11, 2014—the anniversary of 9/11—the news in St. Mary Parish, Louisiana, was alarming. At around 8:30 A.M., the director of the regional Office of Homeland Security and Emergency Preparedness received a call from a citizen concerned about a text message suggesting that there had been a chemical spill: "Toxic fume hazard warning in this area until 1:30 PM. Take Shelter. Check Local Media and columbiachemical.com."

However, as reporters and analysts documented months later, the text message did not occur in isolation. Hundreds of Twitter accounts, many of which appeared to belong to concerned citizens in the area, used the hashtag #ColumbianChemicals to report on the unfolding crisis by asking questions, sharing pictures, and posting videos (Figure 1).

Figure 1. Twitter post showing the Columbian Chemicals plant explosion

Source: John Borthwick, "Media hacking," Render, Mar. 7, 2015, https://render.betaworks.com/media-hacking-3b1e350d619c.

At the same time, reporters and politicians as far away as New York City began to hear about the emergency. One user tweeted at New Orleans *Times-Picayune* reporter Heather Nolan:

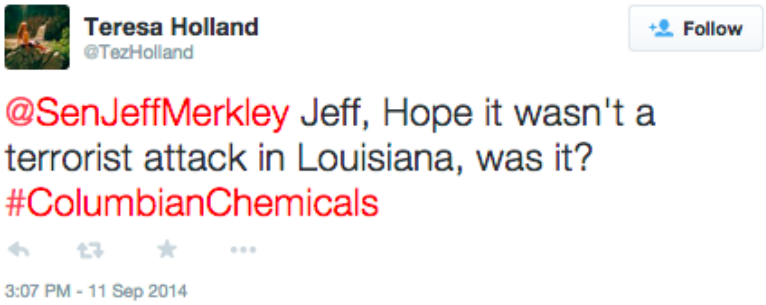
> @EricTraPPP: Heather, I'm sure that the explosion at the #ColumbianChemicals is really dangerous. Louisiana is really screwed now.

Another tweeted at political consultant Karl Rove:

> @zpokodon9: Karl, Is this really ISIS who is responsible for #ColumbianChemicals? Tell @Obama that we should bomb Iraq!

Yet another user tweeted at Oregon senator Jeff Merkley (Figure 2):

Figure 2. Twitter post asking Oregon senator Jeff Merkley about the Columbian Chemicals plant explosion



Source: Matt Kodama, "#ColumbianChemicals Hoax: Trolling the Gulf Coast for Deceptive Patterns," June 12, 2015, https://www.recordedfuture.com/columbianchemicals-hoax-analysis/.

Twitter was not the only platform involved. On YouTube, a video in which "a man showed his TV screen, tuned to an Arabic news channel, on which masked ISIS fighters delivered a speech next to looping footage of an explosion" suggested that ISIS [Islamic State of Iraq and Syria] was responsible for what was now being called an attack.[1] Another video, titled "Panic due to the explosion on a Columbian Chemicals facility in Louisiana," showed an ambulance on the highway. Yet another, titled "Flash from an explosion on a Columbian Chemicals facility in Louisiana," allegedly showed footage of the actual explosion.[2] A Wikipedia page, citing the video, became active, and a public Facebook page (called "Louisiana News") posted an article about the crisis and an alleged statement from ISIS in which the group claimed

Page 2721 of 3957

responsibility for the attack. Finally, both the New Orleans *Times-Picayune* and CNN appeared to pick up the story as tweets of coverage on their websites began to circulate.

Figure 3. Twitter account posting a fake CNN homepage showing the story of the Columbian Chemicals plant explosion

Source: John Borthwick, "Media hacking," Render, Mar. 7, 2015, https://render.betaworks.com/media-hacking-3b1e350d619c.

All of this, however, was news to the people working at Columbian, *as there had not actually been any sort of leak or explosion*. The entire event had been fabricated, perpetuated by a

Page 2722 of 3957

skillfully coordinated social media infrastructure that included a botnet spreading content and "fully functional clones of the websites of Louisiana TV stations and newspapers."[3]

This particular hoax had a relatively small reach since none of the tweets went viral, the mainstream media did not report on the false story at the time if the ongoing operation, and its breakthrough at the national level came months later when *New York Times* reporter Adrian Chen linked the effort to Russia's now infamous Internet Research Agency (IRA). Yet, despite the hoax's failure, it is an almost perfect example of a disinformation campaign.

As the Columbian Chemicals example demonstrates, disinformation (i.e., false information created with the intent to deceive) has the potential to be concerning when it comes to national security. As adversaries and domestic actors alike increasingly use disinformation to achieve a variety of objectives, the study of how disinformation works and how it can be effectively countered has become a national security priority. Most of the study on this topic has thus far focused on disinformation tactics and tools. This report is different because it looks beyond these topics to examine how disinformation affects the recipient and the role psychology plays in one's acceptance of disinformation, since disinformation is a method of exercising psychological influence.

The primary impact of disinformation takes place in the mind. While the psychological principles behind the absorption of disinformation are normal principles invoked when individuals take in any type of information, malign actors can exploit these principles to enhance the likelihood of disinformation's assimilation and spread. Thus, understanding how to counter disinformation's impact requires a firm understanding of disinformation's effect on the mind.

To date, very little work on the subject of the psychology of disinformation has been aimed at policy-makers and defense decision-makers. This report seeks to fill that gap by detailing the psychological principles that allow disinformation to flourish in a way that is easy to understand for those with no psychology background. It can also serve as a primer for those new to the general topic of disinformation because it details the definition of disinformation and why it poses a national security threat.

[3] Chen, "The Agency." A botnet is a network of bots working in coordination. For additional information on the role of bots and botnets in propagating disinformation, please see Megan McBride, Zack Gold, and Kasey Stricklin, *Social Media Bots: Implications for Special Operations Forces*, CNA, DRM-2020-U-028199-Final, Sept. 2020, https://www.cna.org/CNA_files/PDF/DRM-2020-U-028199-Final.pdf.

Page 2723 of 3957

Report elements

To make this complex topic accessible and useful for practical application, there are several important elements of this study. First, for the purposes of this paper, *we make no distinction between disinformation and misinformation*. While the two concepts are distinct, with the intent of the information's creator (i.e., malicious versus benign) as the key difference, this paper instead focuses on the information itself and the effect on the person viewing or hearing it. In most cases, the recipient doesn't know who created the information (e.g., the meme, the video, or the email), so the creator's intent is irrelevant to the psychological impact of these types of disinformation on the audience. We will discuss and include examples of both disinformation and misinformation, categorizing them both as disinformation for simplicity (despite their definitional differences, which we recognize).

Second, the term *disinformation* has come to mean many different things to different people, with a number of distinct, though related, concepts at various times classified as disinformation. In this report, *we focus on the elements of disinformation included in a recent State Department-funded report*, and we make the conscious decision to leave out some of the other concepts occasionally included in this category. First, we exclude such techniques as the creation of fake accounts (bots, trolls, etc.) and fake communities. For our purposes, we consider these tools and actions to be part of "influence operations," a category that includes disinformation but is not exclusively composed of the disinformation itself. Second, while disinformation is a type of influence operation, not all influence operations are disinformation, so we also exclude influence operations that do not include disinformation. In other words, this study centers on the psychology of disinformation, and not on the broader psychology of influence operations. By scoping our report in this way, we are able to speak directly to a pressing national security risk in a clear, concise, and focused manner.

In addition, we are approaching this topic from a *nontechnical perspective*, with the intent of gearing explanations toward those with no prior knowledge of this subject. Therefore, we do not include the universe of potentially relevant psychological principles because that could get overwhelming and unwieldy. The psychological principles discussed in this report emerge from the literature as highly relevant to absorbing and spreading disinformation. Additional information on these principles can be gleaned from the cited material. Moreover, the tone of this study provides clear explanations and examples to make this report useful for its intended audience—policy- and decision-makers.

Page 2724 of 3957

Report organization

In addition to this introduction, this report has three sections all of which address important aspects of our study questions. We first describe what disinformation is within the scope of this report and hone in on the definition we then use for the remainder of the report. While there are many different and conflicting definitions of "disinformation," our first section outlines how we are defining the topic for purposes of this report.

Our second section addresses the issue of why the topic of disinformation, and therefore this paper, is important in the first place. While much has been written on disinformation, in most cases this particular question is sidestepped and the importance of disinformation is simply stipulated. To effectively counter this threat, it is critical to understand why it matters. Consequently, we begin with an exploration of why disinformation is important from a national security perspective before turning to the tricky question of whether disinformation is actually effective at achieving its objectives. We conclude with why it is important to study the psychology of disinformation as a part of this discussion.

With a firm grounding in what disinformation is and why it matters, we then turn to the psychological principles relevant to disinformation. While many principles are tangentially related to this topic, we chose to focus on the four mechanisms critical to the absorption and spread of disinformation: initial information processing; cognitive dissonance theory; the group, belief, novelty (GBN) model; and the effect of emotions and arousal. For each principle, we explain the concept in plain language (with examples) before detailing its implications for disinformation and what can be done to counter its effects.

This report ends with a brief conclusion that highlights the importance of continuing this area of study. The conclusion summarizes how this study has advanced the conversation on countering the spread of disinformation and highlights additional questions to address.

Approach and sources

This report relies primarily on a thorough review of the (1) disinformation and (2) psychology literature to pull out the information relevant to the national security space. For the first two sections on the what and why of disinformation, our primary sources are reports from think tanks and academic institutions as well as news reports, with CNA's previous studies on memes and bots serving as a foundation.[4] We also included some foreign language sources in the

[4] Vera Zakem, Megan McBride, and Kate Hammerberg, *Exploring the Utility of Memes for U.S. Government Influence Campaigns*, CNA, DRM-2018-U-017433-Final, 2018, https://www.cna.org/cna_files/pdf/DRM-2018-U-017433-Final.pdf; McBride, Gold, and Stricklin, *Social Media Bots: Implications for Special Operations Forces*.

Page 2725 of 3957

discussion of adversary use of disinformation to better understand the place disinformation has come to hold in adversary thinking, doctrine, and strategy.

For the third section, we conducted an extensive literature review of psychology journals. Where relevant, we also included literature from other disciplines (e.g., economics, computer science, and marketing). Finally, some of the psychological principles related to modern, technology-enhanced disinformation have roots in foundational experimental psychology. Where applicable, we discuss the root theory first and then apply it to disinformation.

Page 2726 of 3957

What Is Disinformation?

In the messy mainstream and social media ecosystem that characterizes the contemporary world, it is nearly impossible to untangle concerns about disinformation, misinformation, influence operations, adversary interference, propaganda, and online manipulation. Particularly problematic in the context of this report is the distinction between disinformation and misinformation. While these terms are often used interchangeably, they are distinct concepts easily differentiated by attention to the *intent of the content's creator* (Figure 4).

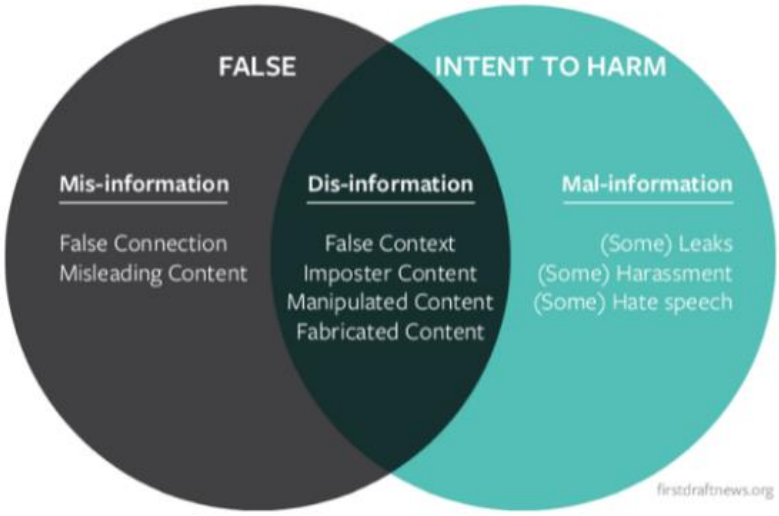
- *Disinformation* is information that is known to be false, and that is spread with the explicit goal of deceiving. In this case, the creator of the information (i.e., the tweet, the post, the email) *intends to deceive.*
- *Misinformation* is information that is false, but that is spread without a desire to deceive. In this case, the creator of the information (i.e., the tweet, the post, the email) has *no intention to deceive*.

It may also be helpful to add a third term to the mix:

- *Mal-information* is information that is known to be true, and that is spread intentionally, with the explicit goal of harming. One example might be sharing private information with the goal of harming the reputation of a politician. Mal-information is slightly different than disinformation and misinformation in that it is not necessarily false (it might contain false elements, but it might also be entirely true). We include it here, though, in an effort to provide a comprehensive oversight of the information ecosystem.

Page 2727 of 3957

Figure 4. Taxonomy of disinformation, misinformation, and mal-information



Source: Temir Asanov, "Fake News in Modern News Media: Disinformation, Misinformation and Malinformation," Medium.com, Mar. 17, 2019, https://medium.com/@tasanoff/fake-news-in-modern-news-media-disinformation-misinformation-and-malinformation-e4fdfa2ab571.

While this relatively simple taxonomy may seem to solve the problem, the reality is that the correct application of these labels (particularly those of disinformation and misinformation) is contingent on the tricky task of identifying the intent attached to the creation of the content.

To illustrate this, let's assume, for example, that Alice, Bernard, Claire, and David are active Twitter users.

One day, Alice wakes up planning to go to the beach with friends, but her mother insists that she wear sunscreen. Alice doesn't want to wear sunscreen because her friends don't wear sunscreen, so she creates a fake graphic detailing the negative consequences of wearing sunscreen and posts it to Twitter with the hashtag #sciencefacts. She then shows it to her mother in an attempt to get out of wearing sunscreen. In this case, the stakes are relatively low and modest, but we could accurately label this content as disinformation because Alice's post meets the criterion of that definition: *intentionally shared false information designed to deceive*.

A few days later, Bernard is on the subway and the people sitting across from him are having a heated debate about sunscreen (perhaps because they saw Alice's post). Bernard finds the argument against wearing it compelling. When he gets home, he creates a graphic to share with his friends. Because Bernard's graphic is not designed to deceive, it would be accurately

Page 2728 of 3957

categorized as misinformation: *information that is false but that is spread without the intent to deceive*.

These examples are relatively straightforward because in both cases we know the intention of the individual who created the content. Classifying content becomes far more complicated, though, when information is retweeted, reposted, and forwarded.

For example, imagine that a few weeks later Claire is online and she finds a graphic detailing the negative consequences of wearing sunscreen. Concerned about the data in the graphic, she shares it via social media. While in some ways Claire does the same thing as Alice and Bernard (sharing a graphic via social media), we need to know the intention of the graphic's *creator* in order to accurately categorize it. If Claire shared Bernard's graphic, then her earnest post would be misinformation: *information that is false but that is spread without a desire to deceive*. If, however, Claire had accidentally stumbled across Alice's graphic, then her post would meet the definition of disinformation, and Claire would simply be an unwitting accomplice in Alice's disinformation campaign. The difference, again, is in the intention of the content's original creator.

Because this report focuses on the *psychology of how disinformation works* (and not on, for example, adversary intentions) the distinction between disinformation and misinformation is not critical. It's true that the *perceived* or *assumed* intent of the content's originator is important; we read material generated by comedians (who we assume intend to amuse us) differently from how we read material generated by news organizations (who we assume intend to educate us). These perceived and assumed intentions, though, are facilitated by a set of cognitive shortcuts that we use to negotiate the world. We see the *New York Times* or *Wall Street Journal* banners and assume that we know the content creator's intent. Sometimes disinformation takes advantage of these heuristics—as the Columbian Chemical hoax creators did by creating a fake screenshot of the CNN website. This is possible because most of the time all we have are our perceptions and assumptions; most people don't know the origins of the material they view and share online, or the true intention of the person who created that content. As a result, we receive disinformation and misinformation the same way.

To hammer this home, let's take David's perspective. David is an everyday social media user scrolling through Twitter. Assuming he doesn't know anything about Alice, Bernard, or Claire, the graphics that he sees in their Twitter feeds are exactly the same. The disinformation/misinformation distinction just isn't relevant for David (i.e., for the end user or consumer), and, psychologically, disinformation and misinformation exploit the same principles. Note that, in many cases, these same principles are also exploited by those attempting to share accurate information. News agencies, as one example, will also rely on these principles to ensure that you visit their sites, view their channels, and click their links. The principles themselves are neutral and normal. This report, therefore, will not distinguish

Page 2729 of 3957

between disinformation and misinformation in discussing the relevant psychological principles; moreover, in an effort to avoid unnecessarily complicating things, we will use the term *disinformation* to refer to both throughout the remainder of this report.

Types of disinformation

While the definitions offered in the section above are accurate and useful, they fall short in capturing the range of material that analysts assess under the rubric of disinformation. A recent State Department-funded report, however, highlights the nuanced and complex nature of this phenomenon:

> To understand the disinformation environment, it is useful to dissect the different elements it encompasses. Disinformation can include authentic material used in a deliberately wrong context to make a false connection, such as an authentic picture displayed with a fake caption. It can take the form of fake news sites or ones that are deliberately designed to look like well-known sites. Disinformation can further include outright false information, shared through graphics, images, and videos. It can also take the form of manipulated image and video content, where controversial elements are photoshopped into innocuous contexts to evoke anger or outrage.[5]

In other words, understanding the psychological impact of disinformation isn't merely about understanding why a simple graphic might trick a few people. Disinformation exists in a context—it exploits our cognitive shortcuts and heuristics in order to be effective—that can be fabricated to varying degrees.

To take just the first part of the definition from the State Department report above, disinformation consists of not only patently inaccurate information designed to appear true (such as the Columbian Chemicals hoax), but also accurate information that has been manipulated or taken out of context. As one example, on September 20, 2015, a pro-Russia media outlet falsely claimed that US Ambassador John Tefft had been spotted at an anti-government rally earlier in the day.[6] In support of its claim, the website quoted Tefft as saying

[5] Christina Nemr and William Gangware, *Weapons of Mass Distraction*, Park Advisors, 2019, accessed Feb. 2, 2021, https://www.state.gov/wp-content/uploads/2019/05/Weapons-of-Mass-Distraction-Foreign-State-Sponsored-Disinformation-in-the-Digital-Age.pdf.

[6] "US Ambassador to Russia John F. Tefft Is Sent to Opposition Rally in Maryino," Посла США в России Джона Ф. Теффта отправили на митинг оппозиции в Марьине, Ren.TV, Sept. 20, 2015, http://ren.tv/novosti/2015-09-20/posla-ssha-v-rossii-dzhona-f-teffta-otpravili-na-miting-oppozicii-v-marine.

Page 2730 of 3957

that he was attending the rally in order to assess the "caliber" of Russian democracy.[7] More interesting, the post included a photo of Tefft mid-interview, with the opposition rally visible behind him (Figure 5). The media outlet even tweeted the photo with the following caption: "US Ambassador to Russia John Tefft strolled at an opposition rally in Marino."[8]

Figure 5. Russian disinformation regarding US Ambassador Tefft

Source: "Посол США в России Джон Ф. Тефт прогулялся на митинге оппозиции в Марьино," Sept. 20, 2015, https://twitter.com/rentvchannel/status/645658877426593792.

[7] Some of this language remains in the REN TV article. Carl Schreck, "Photoshop Wars: U.S. Ambassador 'Attends' Russian Opposition Rally...and the Moon Landing," Radio Free Europe/Radio Liberty, Sept. 21, 2015, accessed Feb. 3, 2021, https://www.rferl.org/a/russia-photoshop-us-ambassador-tefft-opposition-rally-ren-tv/27260885.html.

[8] "The American Ambassador to Russia John F. Tefft Walked at an Opposition Rally in Maryino," Посол США в России Джон Ф. Тефт прогулялся на митинге оппозиции в Марьино, Twitter, Sept. 20, 2015, https://twitter.com/rentvchannel/status/645658877426593792.

Page 2731 of 3957

As the US Embassy in Russia promptly pointed out, though, the image was doctored. In fact, they tweeted a response that included the doctored image, the original image, and other doctored images of Ambassador Tefft at the moon landing and a hockey game (Figure 6).

Figure 6. US Embassy response to Russian disinformation regarding US Ambassador Tefft

Source: "The American Ambassador to Russia John F. Tefft Walked at an Opposition Rally in Maryino," Посол США в России Джон Ф. Тефт прогулялся на митинге оппозиции в Марьино, Twitter, Sept. 20, 2015, https://twitter.com/rentvchannel/status/645658877426593792.
Notes: The original image (upper left); the Photoshopped image that REN TV tweeted (upper right); Tefft at the moon landing (lower left); Tefft at a hockey game (lower right). Translation of Twitter post: Ambassador Tefft spent yesterday's weekend at home. But thanks to Photoshop you can be anywhere. #fake #fake.

In this case, the disinformation very clearly consisted of "authentic material used in a deliberately wrong context to make a false connection" and a manipulated image in which an innocuous element (Ambassador Tefft at a news conference) was Photoshopped into a controversial environment (an opposition rally) in order to "evoke anger or outrage." By

Page 2732 of 3957

contrast, the Columbian Chemicals disinformation campaign is one that involved "fake news sites or ones that are deliberately designed to look like well-known sites" and "outright false information, shared through graphics, images, and videos."

That said, the State Department definition—and, by extension, this report, as we have adopted the State Department definition—leaves out a number of techniques that are often included in discussions of disinformation campaigns but that are better classified as influence campaigns. It does not, for example, include instances in which a fake account or persona is used to spread true information, amplify the posts of a real person, galvanize a new community, or infiltrate a closed community to some ulterior end. There is no doubt an element of deception at play in these behaviors, but they don't meet the definition of disinformation and they rely predominantly on a different set of core psychological mechanisms (some, but not all, of which are explored in this report).

Disinformation poses a critical threat, but there is no standard for how it will look, where it will come from, or what tools might be necessary to identify it. As seen in the State Department definition, it can take many different forms: it can be a skillfully doctored screenshot of the CNN website or a typo-laden meme with no references; it can come from a friend or a media outlet or a stranger; and it might be easily traced via a simple Google query or impossible to track to its source. This project thus takes a different tack, focusing not on how disinformation can be identified but on how it affects—consciously and unconsciously—the recipients that are exposed to it and on how we might mitigate these effects.

Page 2733 of 3957

Why Disinformation Matters

Since the uncovering of widespread Russian meddling in the 2016 election, the US government, academics, think tanks, and social media companies have poured a wealth of resources into the study of disinformation. Every few months, Congress drags the leaders of the largest tech companies to Capitol Hill to grill them on their plans for countering the threat of disinformation; published reports on the issue now abound, tackling topics including Russian tactics, enabling technologies, and strategies for pushing back. Of interest, however, is that most of these resources seem to take for granted the fact that disinformation matters, rather than spelling out why that is the case. This chapter will endeavor to explain why we should care about disinformation, with a focus on the threat it poses in the national security context.

Adversary use of disinformation

While it is tempting to view adversary use of disinformation as a contemporary problem, the use of such means by adversaries attempting to shift the balance of political or military power is a long-standing issue. As just one example, in the first century CE, Octavian waged a fake news smear campaign—deploying primarily "short, sharp slogans written upon coins in the style of archaic Tweets"—to turn public opinion against Mark Antony and secure the role of first Roman Emperor.[9] Disinformation, however, has always been contingent on its ability to circulate widely; operating centuries before the printing press, Octavian had to use coins to spread his message. Consequently, it should come as no surprise that adversary use of disinformation has become something of an international crisis in the social media age, when information spreads globally—leaping between continents and across language barriers—in mere seconds. It should also come as no surprise that our adversaries would seek to weaponize this powerful tool.

The objectives of disinformation are situationally specific. In discrete instances, disinformation might be used to obscure the purpose of a military campaign or cast aspersions on an enemy. The type of disinformation that the modern world is struggling with—even when that disinformation is coming from adversaries—is typically far less restrained or limited. The most commonly cited goals for adversary use of disinformation include causing chaos and confusion, sowing discord, distracting from an issue, casting doubt, and making the truth seem

unknowable.[10] However, while threatening in themselves, these short-term objectives may also be part of a broader long-term strategy for gaining global influence, diminishing US influence, claiming great power status, securing a regime, and more.[11] As states have increasingly become aware of the benefits of information for achieving these objectives (including the ease with which they can harness the power of social media, the inexpensive nature of these efforts, and the relatively low risk of engaging in such behavior), disinformation and related types of information influence have come to hold a more prominent place in many adversaries' doctrine, strategy, and thinking.

One of the US's primary adversaries in this space, Russia has come to view the information space as one of the foundational areas in which states compete today.[12] Rather than seeing the use of information (including disinformation) merely as support for traditional military operations during a conflict, Russia views it as integral to and indistinguishable from conventional capabilities, with utility during every phase of conflict and even in peacetime.[13] In fact, many Russian thinkers have asserted that the boundaries between war and peace are increasingly blurry, with the growing emphasis on nonmilitary means (such as information) asserted as one cause.[14] In 2013, the Russian Chief of the General Staff Valeriy Gerasimov stated that the development of information weapons had the ability to reduce an adversary's combat potential.[15] He further elaborated on this notion in 2019, writing that nonmilitary means are now the primary choice for attaining goals, with military force necessary only when nonmilitary means are unsuccessful.[16] Gerasimov also expressed that, while military means are decisive once armed conflict begins, nonmilitary means make it possible to create the

conditions and influence the operating environment to make the employment of military means more effective.[17] In fact, it is thought that the use of such nonmilitary means as information can even preclude an armed conflict by allowing Moscow to assert influence and shape internal dynamics within an adversary state, creating conditions favorable to Russia.[18]

Another US adversary in this space, China has long sought to exercise control over information that circulates regionally, and has recently begun to extend its influence beyond its borders and neighbors.[19] In the last decade, the Chinese Communist Party has sought opportunities to shape the digital information space and, in 2013, Chinese President Xi Jinping stated that the use of innovative techniques to spread narratives positive for China, and promoting the Chinese view globally, was a priority.[20] The Chinese government has historically employed these tactics in regions close to its borders, such as Taiwan, to attempt to shape the geopolitical situation in a favorable manner.[21] These efforts were typically overt propaganda efforts to push Beijing's preferred narrative.[22] After the onset of the coronavirus pandemic, China began to take a page out of the Russian playbook, employing more covert disinformation on social media to obscure the virus's roots and shift the blame, typically to the US.[23] While it is unclear whether Beijing will continue to employ these methods after the pandemic has passed, the Chinese government has certainly evolved its thinking on how to use information for influence and the utility of disinformation in reinforcing the government's reputation.

Both Iran's conventional military and the Islamic Revolutionary Guard Corps (a parallel military structure tasked with upholding the ideals of the revolution) underscore the importance of informational control for offensive and defensive purposes alike.[24] Iran sees

Page 2736 of 3957

itself as constantly on the defensive from information efforts emanating from other countries' broadcasters, lobbyists, and so on.[25] A recent report on Iran's digital disinformation efforts describes them as "public diplomacy under duress" and notes that pro-Iranian messaging proves most effective when it appears to come from a neutral third party.[26] Iran thus endeavors to set up a narrative structure that its adversaries cannot easily meddle with or take down in order to achieve its objectives, which include positioning itself as a leader in the Muslim world and serving as a bastion against perceived US and western regional intervention.[27]

The pandemic has seen these three adversaries increasingly amplify each other's disinformation, helping China's recent disinformation efforts gain a wider reach than they likely would otherwise. Despite varied objectives, the shared goal of undermining US influence has caused something of a convergence as Russia, China, and Iran work together to diminish the influence of their common adversary. For its part, the US government views disinformation in a patently different way than its adversaries. While many adversaries are increasingly emphasizing the utility of information for achieving a range of objectives, the US is grappling with a range of ethical and legal implications that simply are not issues for its adversaries in this space. As a result, it still does not have a clear strategy for countering information operations, and its efforts in this space tend to be largely reactive.[28] In addition, because the US views information influence through a different lens than many of its adversaries, the role of such efforts in adversary strategy and thinking is not always well understood. Therefore, the study of disinformation is important for ensuring that the US does not find itself unwittingly behind or vulnerable in a key area of competition.

Domestic use of disinformation

It would be naïve to write a paper on disinformation—especially one grappling with its real-world impacts—without acknowledging that domestic US actors are active in this space as well. As with adversary use of disinformation, the objectives for domestic actors using disinformation vary with prominent examples including attempts to shift political discourse on a range of controversial issues, such as election integrity, medical advice, and climate change. The objectives may also be motivated by a desire to garner support—measured in the form of votes, subscriptions, or clicks. Again, though, this is hardly a new phenomenon. In 1835,

The Sun (a newspaper in New York City) published a series of six articles claiming that life—including unicorns—had been observed on the moon by a one of the world's foremost astronomers. The hoax wasn't uncovered for weeks, and the newspaper never printed a retraction, but circulation did allegedly increase. The discovery of the hoax did not put an end to the practice; almost a decade later, *The Sun* again published fake science news. In this case, though, it was famed author Edgar Allen Poe who "sold an ingenious scientific hoax to a newspaper publisher for fifty dollars," though this time the newspaper apparently issued a retraction. [29]

In contemporary America, disinformation circulates on a variety of issues ranging from the absurd (e.g., a 2017 story that Hollywood elites were using "the blood of babies to get high") to the deadly serious (such as that related to the supposed dangers of the COVID-19 vaccine, which could deter large quantities of people from getting the vaccine).[30] The reality, though, is that the psychological mechanisms that allow disinformation to spread are the same, despite the motives of the individual behind such content or its potential impacts.

Is disinformation effective?

Given the variety and prevalence of disinformation, the existence of disinformation is not particularly debatable. Rather, the critical question remaining is whether disinformation is actually effective at changing peoples' minds and helping adversaries achieve their objectives. This effectiveness is incredibly difficult to assess; after all, it is difficult to know whether someone would have taken a certain action or had a certain thought even without the presence of disinformation.[31]

Several recent studies looking into the 2016 presidential election have attempted to answer the effectiveness question, often with disparate results. A 2018 study released by researchers from Ohio State concluded that disinformation likely helped Donald Trump secure victory because around 4 percent of Barack Obama's 2012 supporters did not vote for Hillary Clinton

Page 2738 of 3957

after reading false stories about her.[32] By contrast, researchers from the Stanford Institute for Economic Policy Research released findings in 2017 showing that only a small portion of Americans saw the most widely circulated fake stories, suggesting disinformation during the election may not have been that convincing or influential, though the authors did not offer an opinion on whether this disinformation ultimately had an impact on the election outcome.[33] In January 2020, researchers released a study purporting to show that interaction with trolls from the Russian IRA during the 2016 election did not have any impact on Americans' political behaviors or thoughts because the trolls interacted most with individuals who already held strongly partisan attitudes and were unlikely to change their thinking.[34] However, the study's small sample size means that more research is needed on this topic for findings to be taken as conclusive. Therefore, none of these studies are decisive for answering the question of disinformation effectiveness. In addition, none of these studies explored the question of whether the disinformation campaigns might have affected voter turnout (i.e., perhaps suppressing Clinton voters and energizing Trump voters).

Most alarmingly, even if consumers of disinformation do not believe the false stories they read or change their attitudes or behaviors as a result, the very existence of disinformation or perception that it is spreading can help adversaries achieve their objectives. The perception that adversaries are excelling in the field of disinformation and may be manipulating events could help promote adversary goals by introducing doubt or anxiety about government institutions, journalistic outlets, and other staples of democracy. Russia, for example, often promulgates a number of narratives on unfolding events, not because it hopes that audiences will believe all of the various, often contradictory, messages, but because doing so makes the truth seem unknowable, and makes citizens doubt the official government versions of events. Russia hopes the long-term effect will lead to democratic systems appearing less appealing, engendering a loss of US influence worldwide, while making political systems similar to the one found in Russia seem stronger and more effective in contrast.[35]

[35] "Why Does Russia Use Disinformation?"

Page 2739 of 3957

While it is unclear if disinformation can actually change an individual's opinion, attitude, or vote on a specific issue, there are many examples where disinformation has affected behaviors. The psychological principle of cognitive dissonance (to be discussed later) posits that one's actions have a powerful effect on one's attitudes since you need to rationalize to yourself why you are doing something. Furthermore, it has been shown to affect the national discourse on a variety of topics and to even sometimes make its way into the mainstream media. This is at least partially because disinformation on social media has proved to spread more widely and more rapidly than accurate information. A large 2018 MIT study of Twitter data found that, according to every normal metric, disinformation wins out over the truth on social media by diffusing "significantly farther, faster, deeper, and more broadly than the truth in all categories of information."[36] The authors concluded that this was true because of human nature, rather than the use of bots, because the bots studied in the report amplified just as many true stories as false stories.[37]

In some cases, the promulgation of disinformation has spurred real-world events, and even violence. Countries such as India and Burma have seen social media used to spread disinformation on religious minorities that led to actual violence.[38] An additional salient example was the 2005–2006 rallies in response to the publication of images of Muhammad in a series of European newspapers, which resulted in violence around the world, leading to over 100 deaths and 800 injuries. An often-overlooked component of this dynamic, though, was an informal publication known as the Akkari-Laban dossier. This document, written by Danish-Muslim clerics, was shared widely across the Muslim world. While experts later confirmed that much of its content was accurate, they also noted that it contained inflammatory and false information. Specifically, the dossier implied that one of the images it contained (of a picture of a man dressed as a pig) was meant to depict Mohammad when, in fact, it was an Associated Press photo of a French pig-squealing contest.[39] The dossier did contain accurate images of cartoons as well, but the inclusion of this especially inflammatory image makes it an example of disinformation. It is an instance in which "authentic material" (i.e., the Associated Press image) was "used in a deliberately wrong context to make a false connection" (i.e., implying that the image was part of a larger effort to disrespect Islam).[40] Again, it is impossible to know if this particular image—one among many—was directly responsible for causing the rallies,

Page 2740 of 3957

violence, injuries, and death. Its inclusion, though, is widely recognized to have exacerbated an already delicate situation (because Islam identifies the pig as an unclean animal) and thus contributed to significant real-world consequences.

Summary

It is not always immediately clear exactly why disinformation matters for national security or whether the spread of disinformation is even having an effect. While much has been done to map out adversary disinformation tactics and the digital space that enables them, this work often takes for granted the fact that we should be studying disinformation in the first place. There are, however, demonstrable reasons why it is important to pay attention to disinformation. As adversaries and domestic actors alike increasingly turn to information means as a way to achieve a range of objectives, the study of disinformation is also growing more important to ensure that malign actors do not catch the US flat footed. While it is difficult to prove that disinformation is effective in directly changing minds or votes, there is much evidence it can affect behaviors and discourse. In addition, the lack of conclusive study on whether disinformation is effective means that we cannot discount it; just as we do not know exactly how effective disinformation is, we also cannot prove that it is *not* effective. The issue, therefore, requires greater attention and study.

That study should center not just on disinformation tactics but also on how those tactics affect the mind since disinformation's primary impact occurs in the mind. It is by definition a method of exercising psychological influence. Those spreading disinformation hope that a recipient will believe it, thus allowing the promulgators to achieve their objectives. As mentioned, though, disinformation can have an impact even if it is not believable; the mere perception that disinformation exists may be enough to lead to certain effects, such as the erosion of trust in democratic institutions and the media. This perception, of course, is a mental process as well.

The impact of disinformation, however, is not *limited* to the mind. It can have concrete and critical secondhand effects beyond the foregoing examples of real-world violence. For example, the erosion of trust in democratic institutions can affect voting behavior, increased suspicions about medical care can change willingness to receive that care, and distrust of the police can lead to increased resistance to arrest. As a result, it is important to understand not merely the technical issues of how disinformation is transmitted or how it can be prevented—issues that have received considerable attention over the past few years—but also the psychological question of how disinformation works and how it can be countered. Increased familiarity with the psychology of disinformation is important for understanding how the spread of false information aids in the achievement of objectives and, in turn, how to prevent its harmful impacts. Moreover, because countering the effects of disinformation is also a cognitive process, understanding the psychological principles that make disinformation effective can assist in

Page 2741 of 3957

understanding what principles may counter it. As the use of disinformation and other types of psychological influence become more important to the achievement of malign objectives for both adversaries and domestic actors, understanding how to counter these tactics more efficiently is a national security imperative.

Page 2742 of 3957

Psychological Principles That Can Facilitate Disinformation Adoption and Spread

This section addresses why people are vulnerable to disinformation by examining innate psychological mechanisms that govern how people process and share information. The primary thesis of this section is that disinformation is processed and shared through *routine and ordinarily adaptive psychological processes.*[41]

We begin by describing the psychological principles associated with initial information processing and the subsequent reinforcement of initial judgments through cognitive dissonance. Next, we describe how group membership, beliefs, and novelty affect the way we process and communicate information. Finally, we describe the role of emotion and arousal in people's tendency to share information. In each section, we describe the principles, apply them to disinformation specifically, and describe how normal, routine, and adaptive processes can be used to further spread disinformation. We also describe how these principles can be used to counter the spread of disinformation. Table 1 summarizes these psychological principles, provides a brief explanation, and shows the connection between that concept and disinformation.

[41] Here, the word *adaptive* is used in an evolutionary context. Behavior is adaptive if it helps a person to accomplish a goal.

Page 2743 of 3957

Table 1. Psychological principles relevant for disinformation adoption and spread

Principle	Explanation	Application to disinformation
Initial information processing	We process information as efficiently as possible and that can make us vulnerable to mistakes.	We can accept disinformation as true because we aren't thinking deeply and critically.
Cognitive dissonance	When we are confronted with something that goes against our beliefs, we are motivated to resolve the conflict.	We accept disinformation that supports our initial beliefs and try to reject information that disconfirms our initial beliefs.
Group, belief, and novelty	We more readily share information with people with whom we identify, when we believe it is true, and when it is novel or urgent.	We accept and share disinformation more readily when it comes from people we know, it appeals to what "our group" believes, and when we think it is new.
Emotions and arousal	We pay more attention to information that makes us feel positively or arouses us to act.	We are more likely to share disinformation if it is constructed to elicit high-arousal emotions.

Source: CNA.

Humans are constantly processing information that comes in through our senses. Encoding, cataloging, deciding on action, and storing all that information could be a full-time job without mechanisms to efficiently process it all. Indeed, we don't have the "computing power" to appropriately process each new piece of information as entirely novel. This section describes multiple psychological theories and their effects. They all come down to the same bottom line: our brains have adaptive mechanisms to triage and organize information as quickly and efficiently as possible.

Initial information processing (dual process theory)

Dual process theory is the foundation for understanding how people process information.[42] The theory posits that we have two mechanisms to evaluate new information that comes in through our senses. Table 2 describes the key elements of these two processes: automatic thinking and controlled thinking.

[42] Shelly Chaiken and Yaacov Trope, *Dual-Process Theories in Social Psychology*, (New York: Guilford Press, 1999); Susan T. Fiske and Shelly E. Taylor, *Social Cognition: From Brains to Culture*, 3rd ed. (London: SAGE Publishing, 2016).

Page 2744 of 3957

Table 2. Dual process theory

Process	Characteristics	How it works
Automatic thinking	Fast, effortless, uses few resources	People rely on previous experience with similar information and best guesses (heuristics), easy-to-process information (fluent), and information that is easy to remember to determine how to think about new information and act on it with very little "thought"
Controlled thinking	Slow, deliberate, requires many cognitive resources	People rely on analytical and deep thinking involving questioning assumptions to understand and act upon new information

Source: CNA.

The first process, called *automatic*, requires very little effort and is fast, efficient, and "cognitively cheap." Essentially, when the information comes in, it is immediately associated with something already known and is dealt with or "filed away" appropriately. For example, if someone were driving the same road to work every day and came upon their exit sign, they would automatically turn on their signal and proceed to the exit ramp. This action requires very little thought. Kahneman argues that attention requires effort and that we conserve mental energy by focusing on only a few things and letting automatic processes handle the rest.[43]

The second process is called *controlled*. Controlled processes are slower, more cognitively involved, and require deliberate attention. Going back to the driving example, if the exit you were expecting to see was closed, your brain would begin controlled processes to determine alternative routes for getting to work. While the theory posits two processes, researchers acknowledge that there is really a gradient from the most automatic to the most controlled processes.[44] Fully automatic processes are those that are completely unintentional and happen with little or any cognitive awareness. As processes become more controlled, your brain recognizes novel information and attends more deeply to it. And for processes that are more fully controlled, people are more likely to seek additional information and think about whether the information they have is accurate.

[43] Daniel Kahneman, *Thinking, Fast and Slow*, (New York: Farrar, Straus, and Giroux, 2011).

[44] Fiske and Taylor, *Social Cognition: From Brains to Culture*.

Page 2745 of 3957

The amount of information that people can respond to at any given time is finite,[45] so they default to the processing option that requires the lowest level of effort.[46] This makes our brains highly efficient because we do not waste resources thinking more deeply about things than we need to. There is a downside, however: we can make mistakes. Returning to the exit ramp example, if the exit sign that we see every day is blocked or closed, using the automatic processes to proceed as usual can be dangerous. If we fail to recognize the blocked exit information as important to attend to, we can make mistakes.

Heuristics are one of the primary means used to determine the appropriate level of attention to give information. Heuristics are mental shortcuts we use to make sense of the world.[47] Heuristics are developed through previous experience and connections we make between similar pieces of information. For example, if you have lived in a given climate for several years, you have a heuristic about what the likely temperature will be in January. Most of the time, you will be close to correct and you can dress for the day without checking the temperature. However, *some* days you will be wrong—it will be abnormally warm or cold—and your choice of clothes will be inappropriate. By definition, heuristics are correct (or close enough) most of the time, but can lead to huge errors at other times.

In addition to heuristics, information fluency affects our likelihood of processing information and the depth at which we process it. Information fluency refers to how easily people process information. Processing is more fluent if the information is easier to understand (this includes font, color contrast, accent, and cadence in addition to actual message content).[48] In addition, information that is easier to understand is more likely to be incorporated into what someone believes, regardless of whether it is true.[49] Information that is easy to understand "feels right" and so it seems true.[50] Once that information is incorporated into our scheme, it becomes

[45] Researchers demonstrated that individuals can reliably recall five to nine pieces of information reliably. Beyond that, they are inconsistent or unable to accurately recall. (T. L. Saaty and Müjgan Sagir Özdemir, "Why the Magic Number Seven Plus or Minus Two," *Mathematical and Computer Modelling* 38 (2003), doi: 10.1016/S0895-7177(03)90083-5.).

[46] Fiske and Taylor have coined the term *cognitive miser* to describe the tendency to process information at the lowest acceptable level of effort.

[47] Daneil Kahneman and Amos Tversky, "On the Psychology of Prediction," *Psychological Review* 80, no. 4 (1973).

Page 2746 of 3957

previous knowledge that we can use to build more heuristics and make future judgments about new information.

Another important cognitive psychological principle that influences what we remember is the primacy and recency effect.[51] It is easier for people to remember information that is presented first (primacy) and presented most recently.[52] Studies demonstrating the primacy and recency effect traditionally focused on which words in a list people could remember. The primary and recency effect was displayed when people were more likely to remember the first few and the last few words presented. Studies have also shown that the primacy effect is particularly important for determining what website links people choose.[53] People most often click the links listed first in a search, for example.

Implications of initial information processing for disinformation

The phenomenon of spreading disinformation may appear to be the result of ideology and deep commitment to the material. However, some research suggests that's not the case. Pennycook and Rand demonstrated that individuals who were more prone to think deeply about issues (based on their Cognitive Reasoning Test score) were more able to discern fake from real news and were *more* discerning regarding information that was ideologically consistent than information that was ideologically inconsistent.[54] The implication of this work is that susceptibility to fake news is driven more by "lazy thinking" than it is by entrenched belief structures. Therefore, if people thought more deeply (i.e., used more controlled and less automatic processes), they would be less likely to believe and share disinformation.

Routine initial information processing mechanisms are adaptive and help people to quickly organize information, make sense of it, and decide on action to take. However, the efficiency in these processes leaves people vulnerable to making mistakes and processing information incorrectly. The default automatic processing, relying on heuristics and information fluency, leaves us with "blind spots" that prevent us from recognizing when we need to slow down to distinguish information from disinformation.[55] This results in credible information and

[55] Kahneman, *Thinking, Fast and Slow*.

Page 2747 of 3957

disinformation being treated the same and can lead one to miscategorize disinformation as true.

Automatic thinking makes it likely that miscategorized information will be used. Familiarity plays in our initial information processing. Rather than rely on controlled processes to evaluate the veracity of new information, if the new information is similar to something we are familiar with, we might use a heuristic and assimilate the new information just as we did the old information. The Columbian Chemicals example, described in the introduction, demonstrates how the natural tendency to use automatic thinking could have influenced the spread of that fake story. As noted, the story spoofed the CNN website banner and logo. People familiar with the CNN logo and reputation as a news outlet were likely to use those heuristics to determine that *this* CNN story was as credible as others. Therefore, they may have shared it to inform others of the supposed harm from the explosion.

Information that is more familiar to us (repeatedly presented) is more likely to be recalled as true.[56] This is called the illusory truth effect, when familiarity with something gives the illusion that it is more accurate, and that inadvertently increases someone's belief in that information.[57] This can be especially problematic when attempting to correct disinformation because the correction often repeats the original claim.[58] Swire provides a clear and illustrative example of this challenge:

> Truthfully stating that playing Mozart to your child will *not* boost its IQ mentions the two concepts of "Mozart" and "increased IQ," thereby making the link between the concepts more familiar even though the statement seeks to dispel the Mozart-IQ myth. This inadvertent increase in familiarity may reduce the effectiveness of the correction and may thus contribute to the continued influence effect of misinformation [emphasis in original].[59]

[58] Some researchers have argued for a "truth sandwich" to counter this phenomenon. In a truth sandwich, you would say the truth, refute each point in the disinformation, then repeat the truth. This puts the truth first and last, using the cognitive principles of primacy and recency. It also mitigates the tendency for repeating the lie to make it more accepted. However, the usefulness of a truth sandwich in combating disinformation has not yet been empirically investigated to our knowledge.

[59] Briony Swire, Ulrich K. H. Ecker, and Stephan Lewandowsky, "The Role of Familiarity in Correcting Inaccurate Information," *Journal of Experimental Psychology: Learning, Memory, and Cognition* 43, no. 12 (2017), doi: 10.1037/xlm0000422.

Page 2748 of 3957

Automatic processing does not provide deep consideration of information (source, context, etc.). Thus, when processing automatically, individuals might be more likely to recall repeated information without the context of *why* it was repeated to them. This causes errors in judgment. When those errors in judgment allow us to encode disinformation as true, it is very challenging to undo.

Once we make initial judgments about information, they become part of our scheme and how we understand the world. If that information is inaccurate (because of disinformation or a mistake in processing or remembering), we can be left with encoded inaccurate information to draw from later. There is a memory effect associated with the likelihood of recalling disinformation as opposed to the idea that the disinformation was debunked. The continued influence effect describes how corrected disinformation can continue to influence memory and reasoning.[60] Examples are the persistence of people's belief that Michael Jackson invented the moonwalk, Edison the lightbulb, and Guillotin the guillotine.[61] Essentially, this theory posits that disinformation, once acquired, is very difficult to correct (unlearn). Corrections through debunking and fact-checking can "fail" to correct because the disinformation can be recalled later as fact separate from the debunked information. Essentially, both pieces of information are stored in a person's memory: the disinformation and the disinformation plus the correction. A correction fails when the disinformation is recalled without the correction. Swire, Ecker, and Lewandowsky found that effective corrections (those that have a lot of detail and affirm the facts) can "wear off" in a week and the participants will retell the inaccurate information.[62] Dual process theory and the tendency toward automatic processing may be partially responsible for this phenomenon. If the disinformation was easier to understand and recall, or more familiar than the correction information, then when confronted with new information, we are more likely to rely on the disinformation.

What can we do about it?

Given the difficulty of correcting disinformation once present in a person's memory, it is more fruitful to attempt to *prevent* disinformation from taking root than to *correct* disinformation that has been encoded as truth. Here we focus on two relevant avenues for combating disinformation: the first is bolstering our own internal toolkit, and the second is helping those around us. Table 3 summarizes the prevention mechanisms described in detail in this section.

Table 3. Disinformation prevention mechanisms for initial information processing

	Concept	Description
Internal (with yourself)	Skepticism	Recognizing that people might have hidden agendas, scrutinize information presented to you
	Alertness	Warnings about the effects of disinformation can make you more alert to the possibility
	Analytic thinking	Purposefully make deliberate, controlled, thoughtful evaluations of new information
External (with others)	Create friction	Asking questions that make others process information more deliberately (e.g., asking, "what makes you say that?")
	Inoculation	Provide awareness of possible disinformation so others can recognize it when confronted by it later
	Nudges	Provide subtle cues of the behavior you want someone to exhibit; in this case, processing information more deliberately

Source: CNA.

Bolstering your resistance to disinformation

The first preventive mechanism we describe involves building resistance to disinformation in your own information processing. There are three concepts, all of which can be taught, that guard against the inadvertent adoption of disinformation: skepticism, alertness, and analytic thinking.[63] All three of these processes for individually combating disinformation require the person to move from a greater reliance on automatic to a greater reliance on controlled processes.

Skepticism is the awareness of possible hidden agendas and a personal desire to understand the evidence.[64] It works to fight disinformation because skepticism requires the person to use more cognitive resources to evaluate information.[65] Research indicates that skepticism can be encouraged and trained through exposure to and discussion of pseudoscience and false advertising campaigns.[66]

Page 2750 of 3957

Alertness is a heightened awareness to the effects of disinformation.[67] Warning people about the effects of disinformation—such as the continued influence effect (i.e., the way that once disinformation becomes part of our schema for processing the world, it can be difficult to correct)—can reduce the continued reliance on disinformation, but it will not eliminate it.[68] Research shows that the *specific* description of the continued influence effect had the greatest impact for countering disinformation. More general warnings about the possibility of publishing unverified information are not as effective as a specific warning.

Analytic thinking involves deliberate, controlled, thoughtful evaluation of information as opposed to quick, automatic judgments. Bago, Rand, and Pennycook performed an experiment in which they asked people to make initial (automatic) judgments under time constraints while doing other tasks.[69] Then they asked the participants to reconsider the information without time constraints. They found that deliberation (controlled, analytic thinking) was associated with more accurate perceptions than initial judgments (automatic) made under constrained conditions. This finding indicates that, with deliberation, people can more accurately discern the true information from the false, even if they first made incorrect initial judgments.

Bolstering resistance to disinformation in others

The second avenue to combat disinformation believed because of initial processing errors involves attempts to influence other people's encoding of disinformation. Similar to the individual and internal mechanisms described previously, these techniques are based on the premise that deeper thinking can overcome fallacies in initial, automatic processes. Three related techniques can be used to interrupt the automatic information processing of others: creating friction, inoculation, and nudges.[70]

Friction is the opposite of fluency. Whereas fluency consists of information that is easy to process, understand, and incorporate, friction occurs when something is difficult to process. Fazio found that adding friction to processing by asking people to explain why they think a headline is true or false reduced their likelihood of sharing stories with false headlines and had

[70] "The Psychology of Misinformation: How to Prevent It."

Page 2751 of 3957

no effect on the likelihood of sharing stories with true headlines.[71] The implication here is that, if someone is asked to justify the veracity of something prior to sharing it, they are *less likely* to spread disinformation. Creating friction increases the depth at which individuals have to process information. Those who engage in more reflective thinking have been shown to be more discerning in their social media use. Mosleh and colleagues demonstrated that those who were higher in reflective thinking were more selective about whom they followed, shared news content from more reliable sources, and tweeted about more substantive topics.[72] It is relevant to note that Mosleh's study looked at reflective thinking as a trait, not a state that could be induced through friction. However, the finding is consistent with Fazio's finding regarding induced deep processing.

Inoculation involves building preemptive resistance to disinformation by exposing people to examples of disinformation or disinformation techniques to help them recognize and reject them in the future.[73] This is similar to the concept of inoculation to viruses through the use of vaccines, where individuals are given a small dose, or antibodies for, a disease and that allows a body to prepare an informed defense against it.[74] Cook, Lewandowsky, and Ecker experimentally tested multiple preemptive interventions designed to reduce the effect of disinformation and found that inoculating messages that explain flawed arguments or highlight real scientific consensus on climate change affected climate attitudes.[75] The most substantial effect was on attitudes of perceived consensus in the scientific community; however, other attitudes (including increased trust in climate scientists and decreased trust in contrarian scientists) were also observed. Those that were inoculated were more likely to express perceived consensus among scientists, trust in climate scientists, and decreased trust in contrarian scientists than those who were not inoculated. The implication of these findings is that inoculation *prior to* presentation of disinformation can buffer the disinformation from affecting the individual's perceptions.

The concept of "nudging," introduced by Richard Thaler, involves providing small and subtle suggestions to encourage the type of behavior you want someone to perform or the decision

Page 2752 of 3957

you want them to make.[76] Single-serve snack packaging is an example of a nudge. The manufacturer is suggesting the quantity for one sitting, but the person is free to eat more than one single-serve snack in a sitting. In the realm of disinformation, a nudge would subtly prompt more analytical (controlled) thinking.[77] Pennycook and colleagues measured participants' truth discernment and willingness to share a headline with or without a nudge about accuracy in headlines.[78] Note that, in this case, they were not provided a lecture on the importance of accuracy or prevalence of inaccuracy on the internet. They were simply asked to make a judgment about the accuracy of a single headline (unrelated to the topic). They were then shown other headlines and asked how likely they were to share them on social media. The researchers found that participants were more likely to share true headlines (relative to false headlines) if they had been asked to rate the accuracy of a single headline.[79] Asking them to consider accuracy was a subtle nudge before they were asked if they would share a headline. This finding demonstrates that a minor, unobtrusive, and nonthreatening "nudge" can affect the likelihood of sharing false information on social media, even on a topic unrelated to the disinformation that might be shared.

Cognitive dissonance theory

Cognitive dissonance happens when a person is confronted with two competing thoughts. For example, a person might simultaneously think the following: Exercise is good for my body; when I exercise, it hurts. It is uncomfortable to hold two competing ideas/beliefs at one time. Therefore, people are motivated to reduce the conflict or remove the dissonance.

Dissonance theory describes how people are influenced to either accept or reject beliefs, as well as the information/arguments that accompany those beliefs. The theory includes both cognitive and emotional components. It posits that people feel uncomfortable when they have to reconcile conflicting information. Conflicting information is dissonant, whereas nonconflicting information is consonant, consistent, or compatible (we will use these as synonyms here).

[79] Ibid.

Page 2753 of 3957

When information is incompatible with our beliefs, we react in one of four ways: (1) adding new, consonant cognitions, (2) removing the inconsistent information, (3) reducing the importance of opposing information, or (4) increasing the importance of compatible cognitions.[80] Festinger's classic example was of smokers encountering information indicating that smoking was bad for their health. In this case, the smoker has four options:

1. Change behavior or adopt new attitude (e.g., stop smoking) (adding new, consonant cognitions).
2. Continue to believe that smoking is not bad for health (remove the incompatible information).
3. Compare risk from smoking to risk from something worse, such as auto accidents (reducing the importance of opposing information).
4. Think about the enjoyment of smoking and its good effects (increase the importance of compatible information and that it might assist with weight control).

If someone saw the Columbian Chemicals story and believed it to be true, cognitive dissonance would be created when the reader was confronted with information that it was untrue. For example, if the person saw the fake CNN story about the explosion first, but then saw a news story showing "live footage" of the plant where all was seemingly normal, cognitive dissonance would occur in the person's mind. When confronted with that contradictory information (i.e., the story initially believed to be turned out to be false), people could (1) change their belief and agree they were misled, (2) refuse to believe the corrected information, (3) question or discredit the source trying to convince them it was a hoax (e.g., believing the correction is a "government cover-up," or (4) remind themselves of the importance of protecting ourselves against terrorist attacks and "err on the side of caution."

Cognitive dissonance affects behavior in several ways. Harmon-Jones (editor of *Cognitive Dissonance: Reexamining a Pivotal Theory in Psychology*) summarizes several paradigms of dissonance theory that have demonstrated aspects of human behavior that can be manipulated.[81] These paradigms are first summarized in Table 4 and then described.

Page 2754 of 3957

Table 4. Cognitive dissonance paradigms

Paradigm	Description
Norms consistency	People are more likely to believe information that is congruent with their previous norms, beliefs, and actions
Induced compliance	People will be more likely to change their beliefs if they act in a way consistent with the new belief for little or no direct benefit to them
Belief disconfirmation	People will more likely maintain their belief in disconfirmed information if they believe that a group they identify with still believes it, and they are provided arguments why it is still true
Effort justification	People are more likely to maintain their beliefs if they had to expend significant effort to commit to the belief in the first place; effort also includes incurring costs for committing to a belief
Free choice	People are more likely to maintain their beliefs if they made a willing choice to believe something in the first place; this is especially true if the choice was hard

Source: CNA.

The norms-consistency paradigm. People are more likely to accept and defend information that is consistent with their previous norms and actions. For example, people whose actions are consistent with norms are harsher toward those who fail to conform to them. When sixth graders were given an opportunity to cheat, those who cheated revised their attitudes to believe that cheating was not so bad, whereas those who refused to cheat moved their attitudes to be harsher toward those who cheated. Real-world examples would be with how people dress. Those who follow a traditional dress code can harshly judge men who let their hair grow long, or women who dress in revealing outfits. The men and women who violate these norms believe that dress standards are not important. Adults who pay their taxes can be annoyed at those who do not. Those who do not pay taxes feel justified (e.g., "My loopholes are legal," or "I am genuinely poor").

The induced-compliance paradigm. When people are paid to say something that they do not believe, their belief will change to reflect what they have outwardly said. This is particularly true when the reward offered is small (say $2) and less so if the reward is large (say $20). That is because people can justify saying something against their beliefs for a large amount of money (they can tell themselves: I did not mean it; I did it for the money). However, to justify lying for a small amount of money, they revise their opinion to be more congruent with what they said.

The belief-disconfirmation paradigm. When a group commits to a belief that can be clearly shown to be false, the social circumstances of learning the truth makes a large difference in people's opinions. In other words, for a group that believes the world will end on a specific date (a prediction that can be clearly and easily proved false when it didn't happen), it matters how

Page 2755 of 3957

they learn this information. Festinger provides the example of a group that believed that a flood would engulf the continent but that they (the believing group) had been chosen to be saved. When the anticipated flood did not materialize, the believers who were not with the group at the time changed their beliefs about whether or not the flood would ever occur. However, the believers who were physically with the group—those who were assembled together as the countdown occurred—decided that the flood had simply been temporarily postponed. Thus, the believers who were isolated from the group ultimately rejected the disinformation, and those who were colocated created an alternative form of the original disinformation.

The effort-justification paradigm. When people have had to undergo an unpleasant experience or have exerted a lot of effort to join a group, their commitment to that group will be higher than for groups that do not demand an unpleasant initiation or effort to join. An example is initiation processes at fraternities and sororities. Local chapters with difficult initiations elicit more commitment than do those with easier inductions. This principle is also evident in the observation that converts are often more committed to their religion than natives (i.e., someone who converts to Presbyterianism is likely to be more committed to the faith than someone who was born and raised as a Presbyterian).

The free-choice paradigm. Once someone has made a choice, dissonance is likely to be activated. There will be more dissonance if the choice is difficult, and less dissonance if the choice is easy (e.g., if the superiority of the thing chosen is more obvious). For example, someone choosing between chocolate and strawberry ice cream will experience more dissonance (because the choice is difficult) than someone choosing between chocolate and broccoli ice cream (where the superiority of the chocolate is more obvious). To reduce their experience of dissonance, people will tend to increase their opinion of the alternative they chose, and decrease their opinion of the choice they did not make. In our ice cream example, this means that once I choose chocolate ice cream over strawberry ice cream, my opinion of chocolate will increase and my opinion of strawberry will decrease.

Aronson explains these phenomena in terms of dissonance with a person's self-concept.[82] This is known as the *self-consistency* explanation, and it posits that these phenomena occur when we need to reduce the dissonance between something we've done or said or thought, and the kind of person that we think we are. For example, our brains will work to reduce our discomfort if our decision to cheat or say bad things about someone is dissonant with our self-concept as a good person.

(Chicago: Rand-McNally, 1968); Elliot Aronson, "The Return of the Repressed: Cognitive Dissonance Theory Makes a Comeback," *Psychological Inquiry* 3, no. 4 (1992), doi: 10.1207/s15327965pli0304_1.

Page 2756 of 3957

Harmon-Jones puts it this way: [83]

> Once an individual commits to a given action, any information inconsistent with that commitment is likely to arouse dissonance and prevent the action from occurring. To maintain the commitment in the face of this inconsistent information, the individual selectively enhances the value of the chosen course of action and reduces the value of the unchosen course of action. Doing so makes effective execution of the chosen action more likely. (p. 17)

Implications of cognitive dissonance for disinformation

Dissonance theory has implications concerning whether someone will believe disinformation. First, in the free-choice paradigm, people will emphasize the good aspects of a choice that they freely chose. For example, if Russian disinformation persuades someone to freely join a faked rally (e.g., with paid actors), the person has to justify why they made that choice and went to the rally. People are likely to convince themselves that they attended the rally because it was for a good cause.

This has another implication. If disinformation can limit or shape the reader's response options to a preferred subset of options, then any response will solidify the reader's commitment to that information. Imagine, for example, that someone asks what you might do if you found a wallet on the ground. This could be presented as an open-ended question, but the options could also be shaped and limited by offering a binary choice: take the money for yourself or leave the wallet and walk away. In this case, you aren't presented with an option to return the wallet to the owner, but you are forced to make a choice, thus increasing your commitment to a choice that you may never have chosen on your own.

Disinformation can limit or shape choices by only providing one set of facts, all consistent with the goals of the person pushing the disinformation. For example, disinformation might say that fluoridation causes blindness because (1) my uncle Dave moved to an area with fluoridation and he went blind right after, (2) a survey of people showed that most people believe it does, or (3) the "Honesty in Dentistry Foundation" emphatically states that fluoridation is linked to blindness. [84]

Second, in the belief-disconfirmation paradigm, people will become more resistant to unequivocal disconfirmation if they have others who will confirm the original erroneous belief. Let's say that someone believes that fluoridation causes blindness and sees news of a comprehensive study refuting that belief. They forward the news to a like-minded friend who

[83] Harmon-Jones, *Cognitive Dissonance: Reexamining a Pivotal Theory in Psychology*.

[84] In reality, this was an unscientific survey of the "Honesty in Dentistry Foundation" funded by an anti-fluoridation group.

Page 2757 of 3957

says, "That flies in the face of everything we know. The study was probably biased for the big toothpaste companies." That reassurance will be enough to discount the comprehensive study. In another example, if you belong to an online community that believes in UFOs, and you are presented with "proof" that a recent sighting did not occur, you are more likely to reject this proof if your online UFO friends also reject it. This is a reason why the comments sections of articles often contain messages from people who immediately contradict authoritative voices. Having one or more people echoing their disbelief in contrary information is often enough to maintain commitment to a belief that is disconfirmed by facts.

In the effort-justification paradigm, people are more committed to something if they have to work for it. We already discussed that in terms of hazing and initiation *processes* at sororities and fraternities. This also applies to the *content* of information. Providing disinformation that portrays the recipient as hard-working and moral, while others outside the group are lazy and dishonest, finds a willing audience (people like to feel virtuous) and might also make them recall that they had to work hard to be part of the special group of people receiving the disinformation.

In the induced-compliance paradigm, people are more committed to an idea if they perform an act for little or no compensation than for a large compensation. If a person can be nudged to spread disinformation for little or no financial gain, they will be more committed to the ideas they are disseminating than if they are paid significant amounts of money to do so.

In the final paradigm—norms consistency—people who comply with norms are less tolerant and harsher in their judgment of others who break norms. Those who break norms are more tolerant of others who also break them. Those who see and reject disinformation will judge "disinformation spreaders" harshly. Conversely, those who have spread or supported disinformation will reduce any previous commitments they might have made to fight disinformation in general.

What can we do about it?

When countering disinformation absorption through dissonance, preventive inoculation is a promising technique. An offshoot of dissonance theory, developed by McGuire, preventive inoculation applies the analogy of vaccination as a method of preventing people from being persuaded by propaganda.[85] As explained in the cognition section, inoculation theory states that forewarning people about propaganda will reduce its influence, just as vaccines prevent or lessen the effects of disease. In the case of dissonance, inoculation can remind individuals

[85] William McGuire, "Resistance to Persuasion Conferred by Active and Passive Prior Refutation of Same and Alternative Counterarguments," *Journal of Abnormal Psychology* 63, no. 2 (1961).

Page 2758 of 3957

about aspects of their self-concept and help them rehearse counterarguments to combat disinformation and remove the dissonance in a way that does not introduce disinformation.

However, when attempting to protect against disinformation or refute disinformation, it is important to try not to *create* cognitive dissonance for the receiver. To avoid creating dissonance when using inoculation, messages should be crafted in a way to appeal to previous beliefs:

1. Craft messages that are consistent with the receiver's self-concept.
2. Craft messages that are congruent with previous beliefs.
3. Frame responses in a way that is congruent with your goals and reminds recipients of their group identification.[86]

As a theory of the emotion and cognitive aspects of social influence, dissonance theory posits ways that inoculation can be strengthened. The four key components of using dissonance to strengthen inoculation against disinformation are as follows:

1. *Threat.* By framing the incoming disinformation as a threat, the individual will be emotionally primed to identify the argument as propaganda, fight it, and solidify their previous beliefs. If people are not forewarned and given tools to combat the disinformation, they will be less likely to fight the message or think of counterarguments. Some research suggests that the forewarning of an attack is enough to induce resistance to a message, even without the other key element of refutational preemption (discussed below).[87] This first element is the motivational/emotional part of the effect.
2. *Refutational preemption*. This part allows the receiver to practice making arguments against the propaganda. By providing the receiver with arguments against the propaganda, the person's initial beliefs become stronger and prime them to think of additional reasons why their initial beliefs are correct. Sometimes people accept disinformation simply because they cannot bring to mind reasons for their prior beliefs.
3. *Involvement*. In order for inoculation to have an impact, it helps that the topic be one that the receiver finds important and salient.[88] A key part of this is pointing to the

[86] In the case of disinformation, the group should be defined as an in-group of people who are about to lose something very important. In combating disinformation, this would mean reminding people of the larger groups they are part of, including people with whom they might disagree. We will discuss this more fully in the next section, Group, Belief, Novelty Model (GBN).

[87] Josh Compton and Bobi Ivanov, "Untangling Threat During Inoculation-Conferred Resistance to Influence," *Communication Reports* 25 (2012), doi: 10.1080/08934215.2012.661018.

[88] Michael Pfau et al., "Enriching the Inoculation Construct: The Role of Critical Components in the Process of Resistance," *Human Communication Research* 24, no. 2 (1997), doi: 10.1111/j.1468-2958.1997.tb00413.x.

Page 2759 of 3957

receiver's interest (for example, "the real reason they are going to say this is to take away your right to unfluoridated waters"). Unless someone has a stake in the subject of the disinformation, he or she is less likely to fight it. As explained earlier, another way to obtain involvement is to get people to act on those initial beliefs.

4. *Delay/dosage*. McGuire's original theory posited that, just as it takes time for the body to develop defenses against bacteria, it will take time for inoculation arguments to take hold in the receiver. This portion of the theory is controversial since evidence concerning the need for time has been mixed. However, the evidence does point to the fact that successful inoculation can have long-lasting effects. We think that delay might not be as important as repetition (or dosage) of the inoculation. In our view, the issue is not time, but amount of inoculation. Many inoculations require multiple doses. For example, with rabies vaccine, people should get their first dose as soon as possible (if not received early, the disease is almost always fatal), and on days 3, 7, and 14.[89]

Dissonance has pointed to ways that the inoculation effect can be made stronger. One of those ways is to make the propaganda seem like an immediate attack on one's vested interests. For example, "They will take away your house tomorrow if you do not respond immediately." Additional ideas are to encourage anger at the attack source. For example, "The message will lie to you and assume you are stupid." Third, inoculation will be stronger if it encourages the idea that the propaganda/disinformation is a threat to your core beliefs. For example, "If they have their way, they will spit on the ideals of our religion and democracy." As noted earlier, dissonance theory predicts that inoculation will be stronger if it appeals to our self-concepts as smart, tough, and moral. For example, "Resisting this disinformation means you are clever, stalwart, and principled."

When preventive inoculation is not possible, "therapeutic inoculation" might be valuable. The analogy here is to the rabies vaccine, which is given to people after they have been bitten by a potentially rabid animal. In the case of the rabies vaccine, a dose is given as close as possible to the attack and additional doses are given in succession. Compton and Pfau report that so far, examples of successful therapeutic inoculation are sparse[90] and, in our opinion, conflicting. Table 5 shows how these principles can be used for crafting messages.

Table 5. Key components of using dissonance for inoculation

	Intervention
Threat	Framing anticipated disinformation as a threat motivates the receiver to gather ways to reject it.

The Group, Belief, Novelty (GBN) model

Not all information is equally valuable to an individual. Some information (or disinformation) resonates with some people more than others. The Group, Belief, Novelty (GBN) model helps explain the likelihood that someone will pass information (rumors specifically) on to others.[91] The theory posits that we accept and share information more readily when it comes from people we know, it appeals to what "our group" believes, and when we think it is new.

Because the theory is built primarily related to rumors (a subset of information), we briefly describe rumors and how they apply to this study on disinformation. Rumors are "unverified and instrumentally relevant information statements in circulation that arise in context of ambiguity, danger, or potential threat and that function to help people make sense of and manage risk."[92] While this can include conspiracy theories, they are outside the scope of this paper. For our purposes, all conspiracy theories are rumors but not all rumors are conspiracy theories. In this section, we focus solely on rumors that are not conspiracy theories. Researchers who developed the model cite empirical evidence that rumors are important to study because they alter purchase behaviors,[93] "spark" riots in conflict situations,[94] and

influence stock market buying and selling.[95] In addition, they reference research findings that rumors affect attitudes.[96]

The GBN model is a "two step agent-based mathematical model of negative rumor spread in the context of conflicting groups"[97] that uses concepts and findings from psychology and sociology research as the basis for its equations. According to the first step, the probability of rumor transmission between two people is based on the following three factors:

1. Group memberships (G) of the receiver and transmitter
2. Strength of their belief (B) in the rumor
3. The perceived novelty (N) of the rumor

The second step models how belief (B) levels and the perceived rumor novelty (N) of participants change over time, using findings from the literature on attitude change.

The first factor (G) encompasses several findings regarding how group membership affects the sharing of rumors. In the case of negative (derogatory) rumors, people share them with their in-group (people with whom they identify with, whether age, race, and gender, occupation, or political leaning). They rarely share rumors with the out-group (people with whom they feel little affiliation). It is not surprising that the rumor target (whether it attacks individuals in the in-group or the out-group) and valence (whether it praises or derogates) affect whether a rumor is shared and spreads.

Rumors that derogate the out-group are called "wedge-driving" rumors because they attempt to drive a wedge between groups. They can also be used for self-enhancing motives (boosting one's self-esteem and those of the in-group)[98] or the desire to increase liking between the spreader and the hearer. Conversely, people rarely share derogatory rumors about the out-group with people from that out-group.

The second factor, belief, is the person's degree of confidence that the information is true. In general, people are much more likely to share information they believe to be true. However, the threshold of degree of belief needed to share information is lower when the stakes are

Page 2762 of 3957

higher and it involves planning future actions.[99] For example, college professors involved in tense labor negotiations shared information they believed to be true, but, because of the high stakes involved, they did not require a high degree of confidence in its veracity before sharing it. College students, in a very different context, were reluctant to share information about a recent campus attack that had occurred, for fear of upsetting others with false information.

The third factor, novelty, refers to whether the rumor is novel to the hearer, and whether the hearer thinks it might be new to others. The hearer may spread the rumor as a way to make sense of an uncertain and ambiguous situation. However, once the rumor becomes "old news," people avoid sharing it because it has become stale. This accounts (in part) for why fact-checking and corrections are less shared than the original rumor—and why therapeutic inoculation is more difficult than is preventive inoculation (which we discussed earlier).

Buchanan explored multiple factors to determine which had the greatest effect on self-reported sharing of disinformation online.[100] He considered attributes of the message, including how authoritative the source was and how much consensus information was available (e.g., amount of "likes" on the platform). He also considered viewer characteristics, such as digital literacy, personality, and demographic variables. Across four studies, people who reported the greatest likelihood of sharing disinformation are those who thought the material was true or those who had preexisting attitudes consistent with the information.

Example of the GBN model using authoritarian attitudes

In this section, we use the construct of authoritarian attitudes to describe how the GBN model can illustrate disinformation sharing. People with authoritarian attitudes have been shown to have three predominant beliefs:[101]

- Conventional thinking
- Submission to authority
- A belief in aggression toward out-groups

They also tend to be considerably less open to experience and somewhat more conscientious than other people, whereas those on the other end of the scale ("anti-authoritarians") are more

Page 2763 of 3957

open to experience and slightly less conscientious. More recent literature suggests that those with authoritarian attitudes might also be more disagreeable, dogmatic, and lacking in intellectual humility.[102] However, this work is preliminary.

Note that authoritarian beliefs are, to a degree, situation dependent. Research has shown that people could relax these attitudes when they did not feel threatened, or when new experiences led them to question some of their previous beliefs. [103] Therefore, those with authoritarian attitudes are very likely to share disinformation framed as a threat to conventional beliefs (in the GBN model, it lowers the threshold of belief in the information's veracity before sharing it). Again, using the GBN model, they will share that disinformation with others with whom they identify. Maintaining a sense of being under threat is important for maintaining the cohesion of authoritarian groups.

In the Columbian Chemicals example described earlier, when the photo of the explosion was paired with the idea that Islamist terrorists had caused it, the explosion became threatening to those who are especially threatened by Islamist radicalism and believe that Islamist terrorist attacks in the US are rampant. This made the news appeal to previous beliefs (Beliefs). Sharing the novel photo was not only a civic duty (dissonance theory's explanation) but a way to boost one's self esteem and maintain the group's feelings of threat (Group). The time value of sharing the photo is also important: Sharing the photo immediately (Novelty) gets noticed. Trying to verify the validity of the photo slows you down and makes it less likely that you will be the first with the information.

Implications of the GBN Model for disinformation

The GBN model posits that group identity, degree of belief in the information, and information's novelty are powerful factors in whether information gets shared, with whom we share it, and when we share it. Once disinformation gets shared, it can be amplified and further distorted by those who find the information compelling (as in the old "telephone game" people sometimes play at group gatherings, the original story almost invariably gets distorted in the retelling). These factors coincide with characteristics of the current information environment, where people can stay connected with their smart phones 24/7, allowing people to feel that (1) they are never alone, (2) their voice will always be heard, and (3) they can put their attention

Page 2764 of 3957

anywhere they want to put it.[104] In a sense, we live in a 24/7 virtual telephone game. Although these characteristics of the information environment can speed up rumor spread, the GBN model provides areas where the telephone game can be interrupted, slowed, or corrected.

What can we do about it?

In this section, we discuss how interventions can address all three aspects of the GBN model. Table 6 summarizes the insights, which are described in the subsequent paragraphs.

The first link in the rumor/disinformation chain is the identification with people who are similar to us, whether in terms of opinions, race, religion, gender, or age. The first implication of GBN is to start with people's narrow group identification.

Table 6. Using components of the GBN model to counter disinformation

	Intervention
Group	Expand the "group" with which an individual identifies by highlighting aspects of shared destiny and shared values
Belief	Increase a person's access to opposing opinions/information
Novelty	Create new content to expand the group and open up beliefs

Source: CNA.

Shared destiny

One of the ways that the effects of disinformation can be reduced is through direct contact with the out-group in a situation with a shared destiny.[105] For example, a set of experiments showed that children in integrated classrooms became more accepting of minorities when they were placed into "jigsaw" groups where each child had to teach the others a piece of information that only they knew. This arrangement made it in the best interest of everyone in the group to listen to one another and root for each other's success with learning their part of the materials. We see this effect in the military, where everyone in the unit depends on particular individuals to do their job well; in fact, they entrust their lives to individuals of different races.

Page 2765 of 3957

To emphasize shared destiny in the internet age, it would be useful for login screens to feature information about the shared contributions different groups make to a common goal. Military commands depend on each other for resources, information, skillsets, and use of tools. Although login information can become part of the "background noise" quickly, a rotating set of reminders of interdependence and photos of individuals across the globe with whom one works for could reduce the likelihood of forming "gangs" of like-minded individuals unnecessarily sharing information only with an in-group. Knowing that information will be seen by others can have a moderating effect on what one says and what one shares.

It is important to frame arguments to be sure that people feel that they are not isolated in their original beliefs.[106] That is why advertisements often stress that many other people like their product (e.g., "99% of customers who tried our product liked it"). In the case of disinformation, "Everybody knows that this information is true."

Shared values

Disinformation can be combated by pointing to areas where the out-group and in-group share common values.[107] For example, common values could include admiration of past leaders, respect for the rule of law, fairness, and justice.[108]

Easier access to opposing opinions

The second area of GBN is the degree of belief. The GBN model posits that, when information is shared with another individual, that person's feedback will modify one's belief in the information. A good option to combat the tendency to share information only with like-minded individuals is to provide easier access to opposing opinions.

Two earlier methods of making it easier to access opposing opinions appeared soon after World War II. The fairness doctrine required holders of broadcast licenses to (1) present discussion of controversial issues of public importance and (2) do so in a way that is honest, equitable, and balanced. In the digital world, this might require access to opposing opinions and information on controversial issues in discussion format or question-and-answer format.

A second method was the equal-time rule. This required candidates of both parties to have access to a certain amount of broadcast time at the same rate as the opposing candidate. In this

[106] Wei-Kuo Lin and Michael Pfau, "Can Inoculation Work Against the Spiral of Silence? A Study of Public Opinion on the Future of Taiwan," *International Journal of Public Opinion Research* 19, no. 2 (2007), doi: 10.1093/ijpor/edl030.

[108] These last suggestions of respect for the rule of law, fairness, and justice might not be accepted by those who are truly authoritarian.

Page 2766 of 3957

way, broadcasts could not favor a preferred political candidate by denying the opposing candidate a forum to respond. If candidate A bought 30 seconds of TV time for ads, the opposing candidate would buy 30 seconds at the same rate. For the digital world, this might require allowing like-minded social media groups to allow people with different viewpoints some sort of access to the group.

Maintaining novelty of shared destiny and values

The third area of GBN is novelty. One of the common complaints about government information campaigns of the past (e.g., vaccination information, seat belt information) was that it was repetitive and predictable. If disinformation is to be counteracted, true information needs to be presented in different ways (Google updates its screen with a new factoid daily), and preferably by a diverse group of people, with humor and other ways to lighten the message. We see this in advertising campaigns all the time—GEICO constantly updates its ads, and some brands adopt a new slogan on a regular basis. The point is that old information gets more attention when it is repackaged as new.

Emotions and arousal

A person's state of emotion and arousal can also make them more susceptible to disinformation. It is no secret that some information and messages affect people more than others. In fact, marketing campaigns rely on the effect a message has on a person's emotions and subsequent behavior to buy products, donate to a cause, or vote for a candidate. Countless books, courses, and practices have been built on the concept of using messages to influence people's perceptions and behaviors, including the ubiquitous *How to Win Friends and Influence People* by Dale Carnegie and the extensively researched *Influence: Science and Practice* by Robert Cialdini.[109] While there are multiple compelling aspects of a message that can affect the message's ability to persuade, people are more likely to respond to (and share) information that is interesting, elicits positive emotions, or arouses action.[110]

Novelty, discussed at length in the GBN model section, is a primary determinant of what people consider interesting.[111] In addition, content can inspire emotional feelings (positive or

negative) and can motivate or depress a response (high or low arousal). The following table provides examples that are commonly explored in the literature.

Table 7. Examples of positive and negative emotions that differ on level of arousal

	High arousal	Low arousal
Positive emotion	Awe or amusement	Contentment
Negative emotion	Anxiety or fear	Sadness

Source: CNA.

Emotion and arousal theories would explain that the sharing of the false Columbian Chemicals story was enhanced because the story elicited highly arousing negative emotions of anxiety and fear. Indeed, the cover graphic explicitly included the word "panic" on the page, further priming the arousing emotion.

Multiple researchers have explored characteristics that make information more likely to be shared. Commonly studied characteristics are message placement (i.e., prominence on a page), length, interest, usefulness of the information, emotions evoked from the story, and arousal evoked from the story. Research demonstrates that positive-emotional content is more viral than negative-emotional content, but there is evidence that high-arousal content (regardless of whether it is positive or negative) is more likely shared than low-arousal content.[112] Put simply, the level of arousal the content evokes—or the level of arousal a person feels when he or she sees the content—is even more important than positive or negative content when evaluating the likelihood of sharing information. That means that things that inspire awe, anger, and anxiety are more likely shared than things that inspire sadness. It is important to note that this relationship remains true even when a variety of other factors are held constant, including how interesting the material was, how practical (informative) it was, how prominently it was displayed, how long it was available, how long it was, the influence of the author, and the gender of the author. This research suggests that, when considering how information spreads, focusing on the content of a contagious message is valuable: how does it make people feel? Is that emotion arousing or depressing?

The psychological principles illuminated in this section thus far have described what is happening, but they have not offered explanations as to *why* the relationships exist. Our preliminary research has uncovered two possibilities: (a) an illustration of the Yerkes-Dodson

[112] Jonah Berger and Katherine L. Milkman, "What Makes Online Content Viral?," *Journal of Marketing Research* 49, no. 2 (2012), doi: https://doi.org/10.1509/jmr.10.0353. Page 2768 of 3957

Law that arousal is required to motivate behavior and (b) social psychological theories exploring the individual benefits of sharing information with a larger group.

The Yerkes-Dodson Law is the idea that there is a normal distribution (bell-curve) relationship between performance and arousal.[113] At very low levels of arousal, individuals will not engage in tasks. At very high levels of arousal, individuals are so stimulated that they also cannot engage in tasks. There is an optimal level of arousal, near the midpoint, at which an individual will maximally perform. The research described regarding emotional arousal and sharing of information supports portions of the Yerkes-Dodson law.[114] Low-emotional arousal is not as associated with information sharing as higher levels are. However, we are unaware of researchers specifically testing for the bell-curve relationship regarding information sharing (i.e., are there levels of emotional arousal where individuals will no longer be inclined to share information?).

There are multiple social benefits served by sharing information among group members. Sharing emotional information with others can increase social bonding or increase the perception of similarity among group members, both of which can strengthen a community.[115] However, these social benefits also motivate other behaviors to protect the group and group identity. Brady, Crockett, and Van Bavel note that, when group identities are threatened from individuals inside or outside the group (through challenging information), those who more strongly associate with the group are more likely to express or share emotional information.

Implications of emotionally arousing content for disinformation

The relevance of emotions and arousal to the likelihood of information sharing is an important key for understanding the spread of disinformation. Research suggests that a reader is more likely to share false information if it arouses him or her. A recent study exploring 126,000 tweets found that the false content shared was more novel and inspired fear, disgust, or surprise while the true information shared inspired anticipation, sadness, joy, and trust.[116] In this study, false content inspired emotions that were more arousing than emotions inspired by

[116] Vosoughi, Roy, and Aral, "The Spread of True and False News Online."

Page 2769 of 3957

true content. In addition, they found that bots were as likely to share true information as false information and that those who shared false information were less likely to be influencers (e.g., fewer followers, less active on social media, less time on Twitter, and less likely to be verified) than those who shared true information. Of interest, this article explored the extent to which false and true information spread and found that an individual instance of true content rarely reached more than 1,000 people, whereas the false content routinely reached 1,000 to 100,000 people. The authors conclude that "the greater likelihood of people retweeting falsity more than truth is what drives the spread of false news, despite network and individual factors that favor the truth."[117]

It is possible that multiple psychological principles, activated at the same time, can increase the likelihood that disinformation is absorbed or shared. Kaufman builds on the Yerkes-Dodson Law to describe how higher levels of emotional arousal can interfere with cognitive processes (e.g., short-term memory, organizing thoughts, and rational thinking).[118] This suggests that if something is highly arousing, it might increase the likelihood that a person would process the information using automatic thinking.

What can we do about it?

Our literature review did not produce many insights into combating the effects of emotion and arousal on disinformation. Indeed, the articles that discuss the topic primarily describe the phenomenon in field and laboratory settings, but do not explore ways to counter the effect. However, the literature strongly indicates that emotional and arousing content are more likely to be shared, and Russia has tended to favor disinformation stories on topics known to be highly emotional and arousing to US citizens, such as race relations.

Given that disinformation is, by definition, constructed, it can be constructed to contain emotional or arousing messages. Several of the ideas to combat the absorption and spread of disinformation have been discussed in the previous sections. Inoculation, discussed to combat multiple psychological principles that can facilitate disinformation, could be applied to combating emotional and arousing messages. Making people aware of the effect of emotional/arousing information on beliefs and behaviors can give them tools to respond more accurately. Increasing controlled processing through friction or nudging could also help combat emotional and arousing disinformation. Providing cues to think more deeply about information on suspect websites might prime individuals to be more skeptical of emotional/arousing information they receive.

Page 2770 of 3957

Summary

Understanding how false information spreads is the first step toward containing it. We described four major psychological principles that research demonstrates are related to the absorption and spread of disinformation.

The first psychological principle relates to how people **initially process information**. Our "processing capacity" is limited, so we cannot deeply attend to all new information. We take mental shortcuts to incorporating new information, and those shortcuts can open us up to mistakes. To the extent that we do not process information as deeply as we should, disinformation can be construed as true information.

The second psychological principle, called **cognitive dissonance**, describes the discomfort we feel when we are confronted with two competing ideas. We are motivated to reduce the dissonance by changing one attitude, removing (ignoring) the contradictory information, discounting the importance of contradictory information, or increasing the importance of compatible information. If disinformation supports our initial beliefs or creates less dissonance than true information, we are more likely to believe the disinformation.

The third psychological principle describes the role **group membership, beliefs, and novelty** play in absorbing and sharing disinformation. We are more likely to share information with people we identify with (i.e., consider members of our group) when we believe the information is true and when it is novel or urgent.

The fourth psychological principle describes the **role of emotion and arousal** in our sharing of disinformation. Research demonstrates that we pay more attention to information that makes us feel positively or that arouses us to act. That means we are more likely to share information if we feel awe, amusement, or anxiety than if we feel sadness or contentment.

Further we also summarized the research on countering the effect of disinformation through the psychological principles described. Several techniques discussed could be used to counter disinformation absorption that results from more than one psychological principle. Specifically, preventive inoculation and encouraging deeper, analytic thinking could shield a person from the effects of disinformation. Researchers recommend that disinformation containment policies should emphasize behavioral interventions that confront psychological mechanisms to dissuade the spread of disinformation rather than solely focusing only on bots and algorithms. [119]

Page 2771 of 3957

Conclusion

Brett Horvath, the president of Guardians.ai, argues that "disinformation is not the weaponization of knowledge"; rather, he says, "it's the weaponization of cognition." He further points out that "a coherent strategy…has to be built on principles: What are you defending, and what are you attacking?"[120] As such, we contend that the threat posed by disinformation cannot be met solely with technological and political solutions; the psychological principles that facilitate its absorption and spread must also be considered.

Human brains allow us to organize information and respond to it efficiently, but cognitive mechanisms are not infallible. As the research we have cited makes clear, disinformation weaponizes normal and necessary cognitive mechanisms by exploiting their vulnerabilities. But despite their susceptibility to disinformation, cognitive mechanisms present a potential path forward. To date, much has been written about how to respond technologically and politically to disinformation, but far less has been written about how we might respond psychologically to such manipulation. Identifying the best paths forward in this space requires first developing an understanding of the psychological mechanisms that make disinformation effective. As noted throughout this report, preventive inoculation and encouraging deeper, analytic thinking are frequently discussed in the literature as ways to protect against disinformation. Additional research is necessary to determine effective ways to integrate these two techniques into individual-level cognition and community-level intervention, especially in online environments. A more targeted approach may be possible if we explore the four psychological mechanisms being exploited to spread disinformation: initial information processing, cognitive dissonance, GBN, and emotional arousal.

Ultimately, solutions that consider technological and political factors alone cannot sufficiently diminish the large-scale absorption and spread of disinformation. Because disinformation primarily affects the mind, a multipronged response that includes evidence-based psychological interventions will be critical to the work of countering this growing threat.

Page 2772 of 3957

Glossary

Psychological Terms	Definitions
Alertness	A heightened awareness to the effects of disinformation that can prevent disinformation from being absorbed.
Analytic thinking	Deliberate, controlled, thoughtful evaluation of new information that can prevent disinformation from being absorbed.
Belief-disconfirmation paradigm	After a group commits to a belief that can clearly be proven false, the social circumstances of learning the truth have a large effect on group members' acceptance or denial of that truth.
Cognitive dissonance	Dissonance theory describes how people are influenced to either accept or reject beliefs, and the arguments/information that accompany those beliefs. It posits that people feel uncomfortable when they have to reconcile conflicting information.
Dual process theory	The foundation for understanding the two ways we process information. The first process, called automatic, requires very little effort and is fast, efficient, and "cognitively cheap." The second process, called controlled, is slower, more cognitively involved, and requires deliberate attention.
Effort-justification paradigm	When someone has to undergo an unpleasant experience or exert a lot of effort to join a group, their commitment to that group will be higher than for groups that do not demand an unpleasant initiation or increased effort to join.
Free-choice paradigm	People will emphasize the good aspects of a choice that they freely chose. Once someone has made a choice, dissonance is likely to be activated. There will be more dissonance if the choice is difficult and less dissonance if the choice is easy.
Friction	Friction occurs when something is difficult to process and can be created by asking questions that make others process information more deliberately (e.g., asking, "what makes you say that?"). It is the opposite of fluency and can prevent disinformation from being absorbed.
Group, Belief, Novelty (GBN) Model	The theory posits that we accept and share information more readily when it comes from a group of people we know (G), it appeals to what "our group" believes (B), and when we think it is new (N).

Page 2773 of 3957

Psychological Terms	Definitions
Heuristics	Mental shortcuts we use to make sense of the world. Heuristics are developed through previous experience and connections we make between similar pieces of information.
Illusory truth effect	When familiarity with something gives the illusion that it is more accurate, inadvertently increasing someone's belief in that information.
Induced-compliance paradigm	When someone is paid to say something that they do not believe, their belief will change to reflect what they have outwardly said. This is particularly true when the reward offered is small, and less so if the reward is large.
Initial information processing	Our brains employ mental shortcuts in an effort o process information as efficiently as possible, which can make us vulnerable to mistakes.
Inoculation	To provide awareness of possible disinformation and the effects of disinformation so others can recognize it when confronted by it later. This can prevent disinformation from being absorbed.
Information fluency	A person's ability to process information. This increases when information is clear and easy to understand.
Negative emotion	Emotions that make people feel bad. Examples include anxiety, fear and sadness.
Norms-consistency paradigm	People are more likely to accept and defend information that is consistent with their previous norms and actions.
Nudge	To provide subtle cues for an encouraged behavior. This can prevent disinformation from being absorbed.
Positive emotion	Emotions that make people feel good. Examples include, awe, amusement, and contentment.
Primacy and recency effect	The tendency for people to remember information that is presented first (primacy) or presented most recently (recency).
Skepticism	The awareness of possible hidden agendas and a personal desire to understand the evidence. This can prevent disinformation from being absorbed.
Therapeutic inoculation	Providing awareness of disinformation that a person has already experienced to attempt to remove that disinformation and mitigate its effect on future beliefs and behavior.
Yerkes-Dodson Law	The theory that there is a normal distribution (bell-curve) relationship between performance and arousal. At very low levels of arousal, an individual will not engage in tasks. At very high levels of arousal, the individual is so stimulated that they also cannot engage in tasks.

Page 2781 of 3957

This report was written by CNA's Strategy, Policy, Plans, and Programs Division (SP3).

SP3 provides strategic and political-military analysis informed by regional expertise to support operational and policy-level decision-makers across the Department of the Navy, the Office of the Secretary of Defense, the unified combatant commands, the intelligence community, and domestic agencies. The division leverages social science research methods, field research, regional expertise, primary language skills, Track 1.5 partnerships, and policy and operational experience to support senior decision-makers.

CNA is a not-for-profit research organization that serves the public interest by providing in-depth analysis and result-oriented solutions to help government leaders choose the best course of action in setting policy and managing operations.

Dedicated to the Safety and Security of the Nation

REPORT DOCUMENTATION PAGE	Form Approved OMB No. 0704-0188

The public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing the burden, to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.

14. ABSTRACT

PERSEREC recently conducted a study of supervisor and coworker reporting of security-related information. Explanations were offered by security managers and by focus group participants as to why many security-related behaviors are under-reported. The main problem is that people are hesitant to report suitability behaviors, such as excessive drinking, because they are not able to see a direct link between the particular human problem and national security. Consequently, PERSEREC developed a clear, succinct list of behaviors that could pose a potential threat to national security and thus should be reported if observed. Members of various counterintelligence agencies in the government reviewed and edited this list. It has since been included in the new DoD Instruction 5240.6 *Counterintelligence Awareness, Briefing, and Reporting Programs* as Enclosure 3. In addition, PERSEREC developed a brochure based on these items as an educational tool to help DoD components and other departments that have need of security education materials on supervisor and coworker reporting or for counterintelligence briefings.

Preface

PERSEREC recently conducted a study of supervisor and coworker reporting of information of security concern. In response to our probing for answers as to why security-related behaviors are under-reported, interviewees and participants in focus groups said that policies were written too broadly for them to implement. The participants also said that they were very willing to report serious behaviors that clearly related to counterintelligence or security, but much less willing to report on suitability types of behaviors, such as excessive drinking and personal problems, because they were not able to see the direct link between the human problem and national security. They would prefer that these personal troubles be handled through employee assistance programs or other monitored treatment programs.

In response to these research findings, PERSEREC developed a list of Counterintelligence Reporting Essentials (CORE) that contained items that were primarily behavioral and clearly linked to counterintelligence and security risk. Working with the counterintelligence community, PERSEREC honed the list to 16 items. These 16 items were included as Enclosure 3 in the new DoD Instruction 5240.6, *Counterintelligence Awareness, Briefing, and Reporting Programs*.

In addition, PERSEREC created a CORE brochure that can be disseminated throughout the counterintelligence and security communities. The brochure briefly discusses the rationale for developing the CORE list, describes potential uses by security professionals, and lists the specific behaviors that should be reported. The behaviors fall under the headings, Recruitment, Information Collection, Information Transmittal, and Suspicious Behaviors.

We believe the CORE list—as a new policy enclosure and an easy-to-read brochure—responds directly to the concerns of clearance holders in a way that is likely to improve security awareness and overall reporting of security-relevant behaviors.

Acknowledgements

The authors would like to express their appreciation to a number of people who helped with this research. Thanks to Troy Sullivan and Windell Courson, staff members at the Department of Defense Counterintelligence Directorate, Office of the Under Secretary of Defense (Intelligence), who worked with the authors in deciding which of PERSEREC's reportable behaviors would be included as an Enclosure to the new DoD Instruction 5240.6, *Counterintelligence Awareness, Briefing, and Reporting Programs.*

PERSEREC's original CORE list had circulated in October 2002 among the staff of the Joint Counterintelligence Evaluation Office (JCEO) under Mary Griggs. JCEO then distributed the list to members of the DoD Investigative Working Group (IWG), representing Army Military Intelligence, Air Force Office of Special Investigations, Defense Intelligence Agency, Defense Security Service, National Security Agency, Naval Criminal Investigative Service, and the National Reconnaissance Office, and to a number of counterintelligence personnel at the Counterintelligence Field Activity (CIFA). We are grateful to these people for their helpful comments and suggestions. Many thanks also to Virginia Kirk at JCEO for her administrative and logistical assistance.

Executive Summary

Background

In January 2003, the Defense Personnel Security Research Center (PERSEREC) published a report of a study that examined the supervisor and coworker reporting requirement within the Department of Defense's (DoD) personnel security program (Wood & Marshall-Mies, 2003). The study dealt with self-initiated reporting, when a person would see a subordinate or colleague behaving inappropriately and report the behavior to Security. One of the aims of the study was to better understand the prevalence of workplace reporting, the kinds of behaviors that are reported, and the reasons people may not report. To this end, researchers interviewed 45 security managers and management personnel in 20 DoD and non-DoD federal agencies who described the reporting rate as very low, perhaps reflecting an under-reporting of relevant behaviors. They offered a series of explanations as to why people may not report, including cultural resistance; negative perceptions of reporting; lack of knowledge and experience of the system among security officers, supervisors, and the workforce; and unclear relationships between Security, employee assistance programs, and other functions.

The PERSEREC study also included several focus groups with supervisors and employees at various federal agencies to learn participants' views and recommendations concerning reporting. Focus group participants made it clear that they are willing to report egregious behaviors that they believe pose a likely threat to national security. They simply want to know precisely what such behaviors are. Wording of policy, in their opinion, is amorphous and confusing. All participants without exception said that they would seldom report certain gray-area behaviors that they describe as too personal ("the more private things," as one put it). Such behaviors may include emotional or mental, financial, alcohol and drugs, and marital problems, and unusual personal conduct. Research suggested that participants are reluctant to report these behaviors because they cannot see a link between the behavior and national security; in other words, they are unlikely to be convinced of the security relevance of personal problems. They may also be reluctant because they do not trust the system to deal with the reports equitably and also may fear possible reprisals to themselves as so-called whistleblowers.

In an attempt to end confusion about what should always be reported, the PERSEREC study recommended the development of a list of egregious behaviors that are closely connected to counterintelligence (CI) and security. The list would not include behaviors of a suitability or reliability nature since the research showed that supervisors and coworkers have said they would be unlikely to report such matters.

The present report documents the rationale for preparing the list and describes the processes by which it was developed and its eventual inclusion as Enclosure 3 in the new DoD Instruction 5240.6, *Counterintelligence Awareness, Briefing, and Reporting Programs*.

Page 2794 of 3957

Method

Research comprised the following steps: (1) comparison of major CI policy documents; (2) review of other source documents; (3) development of a draft Counterintelligence Reporting Essentials (CORE) list of behaviors that must be reported; (4) presentation of the draft CORE list for review and editing by CI experts; (5) introduction of the final CORE list into DoD policy; and (6) promulgation and implementation of the final CORE list, through the Defense Security Service (DSS) and other CI entities, for use in security and education programs and CI briefings.

Policy Review and Review of Other Source Documents

The various key policy documents that concern the reporting of CI and security-related behaviors were compared and contrasted, exploring areas of overlap, specificity, and authoritative procedures, i.e., whether one policy superseded another. Other documents and publications that have been developed by DoD, intelligence community agencies, and PERSEREC in the area of CI awareness and education were also reviewed. Examination of these documents provided background, context, and a pool of information from which PERSEREC researchers could draw as they developed the draft CORE list.

Development and Evaluation of Draft CORE List of Behaviors

PERSEREC researchers proceeded to pull together a draft CORE list of behaviors that are observable and may be associated with potential risk to national security. This became known as the CORE list.

The draft CORE list was evaluated by staff at the Joint Counterintelligence Evaluation Office (JCEO), the DoD Investigative Working Group (IWG), and by the Counterintelligence Field Activity (CIFA). The list was then reviewed by staff at the DoD Counterintelligence Directorate in the Office of the Under Secretary of Defense (Intelligence).

Introduction of Draft CORE List into DoD Instruction 5240.6

The 16 items in the final CORE list were added as an Enclosure to the revision of DoD Instruction 5240.6, *Counterintelligence Awareness, Briefing, and Reporting Programs*.

Implementation of PERSEREC's Brochure in the Field

PERSEREC developed a separate brochure that includes the 16 original PERSEREC CORE list items, along with eight others added by the DoD Counterintelligence Directorate. This brochure, which explains the rationale for the list and its potential uses, is attached to this report as a pdf file and is detachable for use in the field.

Page 2795 of 3957

Recommendation

DoD should distribute the PERSEREC brochure to CI and security agencies for their review and possible implementation. Possible uses include security education briefings of various sorts (e.g., initial, refresher, and CI awareness). By concentrating on direct CI- and security-related behavior, personnel in the field are likely to develop a better understanding of exactly what to report and a greater commitment to reporting it.

Background

PERSEREC in 2003 published a report that studied self-initiated reporting, where supervisors and co-workers person observe suspicious behavior by a fellow worker (usually in the workplace) and report it to a supervisor or security official (Wood & Marshall-Mies, 2003).

During the course of the study, PERSEREC staff learned from several sources—extensive literature reviews, headquarters management personnel, and people working in the field—that, despite formal policies requiring employees to report security-related behaviors, they do so only rarely. Yet employees in the field are not averse to reporting genuine security infractions. In fact, under appropriate conditions, they are quite willing to act as eyes and ears for the government. They are simply confused about precisely what is important enough to report. Many government workers anguish over reporting gray-area behaviors they do not consider to be clearly connected to security. They say the policies are written too broadly for the average person in the field. One supervisor, echoing the opinion of many, said, "We need a clear communication of what is mandatory to report." A coworker complained, "You can't ask people to do something if you don't define it…We need more definitions. How do we know which behaviors are OK and which are not?"

One of the study recommendations, therefore, was that PERSEREC, in collaboration with counterintelligence (CI) professionals, develop a clear, succinct list of behaviors that could pose a potential threat to national security and thus should be reported if observed. This list, to be known as the Counterintelligence Reporting Essentials (CORE) list, would contain behavioral examples to clarify what is considered egregious or potentially critical to national security. Use of the CORE list should then facilitate reporting of truly significant behaviors. Behaviors that raise questions about reliability, the gray-area behaviors that interviewees said they would be less willing to report, would be handled by supervisors through counseling, employee assistance programs, or other monitored treatment programs. The goal was to produce a relevant and useful CORE list, which, through adoption as policy, could be employed to improve reporting requirements and security education programs.

Method

The research methodology to produce, review, and implement the CORE list required six steps: (1) comparison of major CI policy documents; (2) review of other source documents; (3) development of a draft CORE list of behaviors that must be reported; (4) presentation of the list to CI experts for review and editing; (5) introduction of the CORE list into Department of Defense (DoD) policy; and (6) promulgation and implementation, through the Defense Security Service (DSS) and other CI entities, for use in security and education programs and in CI briefings.

Page 2800 of 3957

Policy Review

The purpose of this section is to report our review of all of the different policy documents related to supervisor and coworker reporting and to compare and contrast the requirements of various entities with regard to this subject. PERSEREC researchers reviewed the policies, Directives, and Executive Orders that concern the reporting of CI- and security-related behaviors. The review explored areas of overlap, specificity, and authoritative procedures, i.e., whether one policy superseded another.

The Clinton administration's Presidential Decision Directive PDD/NSC-12, *Security Awareness and Reporting of Foreign Contacts* (August 5, 1993) requires that government employees report all contacts with individuals of any nationality, either within or outside the scope of the employee's official activities, in which illegal or unauthorized access is sought to classified or otherwise sensitive information, or the employee is concerned that he or she may be the target of actual or attempted exploitation by a foreign entity.

Executive Order 12968 (August 4, 1995) states in Sec. 6.2(a) that employees should protect classified information from unauthorized disclosure; report all contacts with persons, including foreign nationals, who seek to obtain classified information; report all violations of security regulations to appropriate security officials; and comply with all other security requirements of the order. It adds in Sec. 6.2(b): "Employees are also encouraged and expected to report any information that raises doubts as to whether another employee's continued eligibility for access to classified information is clearly consistent with the national security."

Title 50, USC, Chapter 23, Subchapter 1, Sec. 797, lays out the penalties for violating security regulations at a variety of government facilities and under a variety of circumstances. Such a violation will constitute a misdemeanor and carry with it, upon conviction, a fine not to exceed $5,000 or imprisonment for not more than one year, or both.

The Director of Central Intelligence Directive (DCID) 6/4, *Personnel Security Standards* (July 2, 1998), lists (Annex E, 6 [a] – [m]) several general categories of behavior that are reportable if observed in the workplace. These are similar to the adjudicative guidelines (in the DoD Directive 5200.2-R) except that they do not include the brief behavioral descriptions that appear in the adjudicative guidelines. The categories, which—like the adjudicative guidelines—mix CI, security and reliability issues, are listed below. Only two—(b) and (c)—are strictly related to CI issues.

(a) Involvement in activities or sympathetic association with persons which/who unlawfully practice or advocate the overthrow or alteration of the United States Government by unconstitutional means.

(b) Foreign influence concerns/close personal association with foreign nationals.

(c) Foreign citizenship or foreign monetary interests.

(d) Sexual behavior that is criminal or reflects a lack of judgment or discretion.

(e) Unwillingness to comply with rules and regulations or to cooperate with security processing.

(f) Unexplained affluence or excessive indebtedness.

(g) Alcohol abuse.

(h) Illegal or improper drug use/involvement.

(i) Apparent mental or emotional disorder(s).

(j) Criminal conduct.

(k) Noncompliance with security requirements.

(l) Engagement in outside activities that could cause a conflict of interest.

(m) Misuse of information technology systems.

The 1996 DoD Instruction 5240.6 (*Counterintelligence [CI] Awareness and Briefing Program*) (July 16, 1996) differed significantly from the DCID 6/4. DoD Instruction 5240.6 is the fundamental, workhorse instruction for CI awareness and briefing programs for DoD. (For an analysis of the new DoD Instruction 5240.6, please see pp. 9-10 below.)

In the 1996 DoD Instruction 5240.6, the 13 reportable items from DCID 6/4 were described only briefly and included items that were not strictly CI-related, e.g., sexual behavior, alcohol abuse, illegal or improper drug use/involvement, apparent mental or emotional disorders. While several items were quite specific, e.g., behaviors such as contacts with foreign intelligence or terrorist organizations, requests for unauthorized access to classified or unclassified controlled information, contacts with known or suspected foreign intelligence officers, and contacts with foreign diplomats, the instruction went on to list (at 6.1.2) an amalgam of behaviors, strung together in one sentence and describing 10 broad areas that lack specificity and are often repetitive of themselves. "…DoD personnel who have information about activities pertaining to espionage, terrorism, unauthorized technology transfer, sabotage, sedition, subversion, spying, treason, unauthorized release of classified or unclassified controlled information, or unauthorized instructions into automated information systems."

The military services published their own instructions, based on the 1996 DoD Instruction 5240.6. The Air Force's AFI71-101V4, *Counterintelligence* (August 1, 2000), closely mirrors the 1996 DoD Instruction 5240.6, as does the Navy's SECNAVINST 3875.1A *Counterintelligence and Awareness Briefing Program* (February 19, 1999).

Page 2802 of 3957

The Army, however, expands considerably on reporting requirements in its AR 381-12 *Military Intelligence Subversion and Espionage Directed Against the U.S. Army (SAEDA)* (January 15, 1993). In Chapter 3, *Reporting Requirements*, it addresses three areas: *SAEDA Incidents*, *Additional Matters of CI Interest*, and *Indicators of Espionage*. The segment on SAEDA incidents describes the incidents and situations that must be reported, these items reflecting the old DoD 5240.6 but in much more detail. The next section, *Additional Matters of CI Interest*, expands greatly the reportable behaviors. These include, for example, the discovery of listening devices; unauthorized absence of Department of the Army (DA) personnel with high-level clearances; reports of attempted or actual suicide; COMSEC insecurities; assassination (or attempts) of anyone by terrorists or agents of foreign powers; defection, or attempted or threatened defections; detention of personnel by a foreign government with interests inimical to those of the US; impersonation of DA intelligence personnel; willful compromise of the identify of US intelligence personnel engaged in clandestine intelligence and CI activities; and incidents in which foreign countries offer employment to US personnel involved in the development of nuclear weapons.

The third section of AR 381-12, *Indicators of Espionage*, lists 19 behaviors that may be indicative of espionage, although the regulation stresses that while a single indicator by itself does not necessarily mean that a person is engaged in espionage, it must be reported. This list is reproduced below:

(a) Any attempt to expand access to classified information by volunteering for assignments or duties beyond the normal scope of responsibilities or attempting to obtain information for which the person has no authorized access or need to know.

(b) Unauthorized removed of classified materials from work area.

(c) Extensive use of copy, FAX or computer equipment to reproduce or transmit classified material that may exceed job requirements.

(d) Repeated or unrequired work outside normal duty hours, especially unaccompanied.

(e) Obtaining witness signatures on classified document destruction forms when witness did not observe the destruction.

(f) Bringing unauthorized cameras, recording devices, computers or modems into areas where classified data is stored, discussed, or processed.

(g) Unexplained or undue affluence, including sudden purchases of high-value items where no logical income source exists. Attempts to explain wealth by reference to inheritance, luck in gambling, or some successful business venture.

Page 2803 of 3957

(h) Opening several bank accounts containing substantial sums of money where no logical income source exists.

(i) Free spending or lavish display of wealth which appears beyond normal income.

(j) Sudden reversal of financial situation or sudden repayment of large debts or loans.

(k) Correspondence with persons in countries of special concern.

(l) Unreported contact with officials of countries of special concern.

(m) Frequent or unexplained trips of short duration to foreign countries.

(n) Attempts to offer extra income from an outside endeavor to personnel with sensitive jobs or to entice them into criminal situations that could lead to blackmail.

(o) Homesteading or repeatedly requesting extensions to tours of duty in one assignment or location, especially when the assignment offers significant access to sensitive information or the job is not desirable.

(p) Repeated involvement in security violations.

(q) Joking or bragging about working for a foreign intelligence service.

(r) Visits to a foreign embassy, consulate, trade, or press office.

(s) Business dealings with nationals or firms of countries of concern.

In summary, DoD Instruction 5240.6, flowing from higher-level policies such as a Presidential Decision Directive and an Executive Order, lays out the basic requirement for CI awareness and briefing programs in the DoD. Air Force and Navy wrote instructions that closely parallel the DoD instruction; the Army elaborated on the instruction, providing more details and specifics. Requirements vary somewhat from one entity to another. PERSEREC staff decided that a short, succinct list of reportable behaviors is needed rather than having supervisors, coworkers, and agencies deal with the plethora of different approaches and degrees of specificity found in the different policies.

Page 2804 of 3957

Review of Other Source Documents

Having completed the policy review, PERSEREC staff reviewed a selection of publications and documents that have been developed by DoD, intelligence community agencies and PERSEREC in the area of counterintelligence awareness and education. These would provide the context and information required to construct PERSEREC's draft CORE list.

DSS published in January 1998 a For Official Use Only (FOUO) document, "Recognition of Potential Counterintelligence Issues." The document was intended to aid the facility security officers of cleared U.S. defense contractors in recognizing potential CI issues.

PERSEREC's *Employees' Guide to Security Responsibilities* has a section on CI indicators.[1] This contains 23 items grouped into five categories: (1) potential motivation, (2) potential indicators of information collection, (3) potential indicators of information transmittal, (4) potential indicators of illegal income, and (5) other potential indicators. (The Guide also has a list of security and suitability behaviors, organized according to the 13 adjudicative guidelines, e.g., alcohol consumption, allegiance to the United States, criminal conduct, drug involvement, etc.)

DoD 5220.22-M, *National Industrial Security Program Operating Manual* (January 1995), Section 1-300 General, under *Reporting Requirements*, states that contractors are required to report certain events that have an impact on the status of the facility clearance, impact on the status of an employee's personnel clearance, affect proper safeguarding of classified information, or indicate classified information has been lost or compromised. Contractors are required to establish such internal procedures as are necessary to ensure that cleared employees are aware of their responsibilities for reporting pertinent information to the facility security officer, the FBI, or other Federal authorities as required by the Manual, the terms of a classified contract, and U.S. law. The manual states that contractors must provide complete information to enable the authorities to ascertain whether classified information is adequately protected. Contractors must submit reports to the FBI, and to their local security officials. This appears to be the only place in the National Industrial Security Program Operating Manual (NISPOM) where reporting requirements are mentioned.

DSS publishes an annual brochure for security professionals, CI personnel, and cleared contractors, *Suspicious Indicators and Security Countermeasures for Foreign Collection Activities Directed Against the U.S. Defense Industry.* The brochure is designed to help employees recognize suspicious contacts. The most frequent information-gathering method employed by foreign entities is simply to request information from individuals working in U.S. defense industry science and technology programs. The brochure lists indicators to watch for and appropriate security countermeasures to apply. Other methods include inappropriate conduct during visits;

[1]For more detail, see the *Employees' Guide to Security Responsibilities* on the Web at www.dss.mil/training/securityawareness.htm.

Page 2805 of 3957

suspicious work offers; international exhibits, conventions and seminars; joint ventures/joint research; foreign acquisition of technology and companies; co-opting former employees; and targeting cultural commonalities. For each of these methods, DSS provides a list of indicators and recommended security countermeasures.

The following agency brochures and booklets were also reviewed:

- CIA orientation briefing, "Reporting of Security-Relevant Behavior Requirements"
- CIA brochure, "Why We Care: A Guide for Understanding Suitability and CI Indicators" (FOUO)
- DIA brochure, "Plenty of Excuses But No Good Reasons"
- DIA brochure, "Countering Espionage"
- DISA Newcomers' Briefing
- DSS's "Suspicious Indicators and Security Countermeasures for Foreign Collection Activities Directed against the U.S. Defense Industry"
- DOE brochure, "Counterintelligence in our Changing World"
- DOE brochure, "Clues to Spotting a Spy"
- FBI "Security Handbook"
- Navy "Security Awareness Chronicle"
- NCIS list, "Indicators of Espionage"
- NIMA "MSSR," unclassified video briefing on espionage, recruitment, security, reporting requirements, etc.
- NSA booklet, "Foreign Intelligence Recruitment Approaches"
- State Department's booklet, "Counterintelligence for the 1990s and Beyond"

Each agency mentioned above had its own perspective on the subject of CI awareness programs, producing guides, learning tools, manuals, studies, handbooks, brochures and booklets that contain all the indicators and behaviors that agencies have considered to be of CI concern. Review of the above documents provided background and a pool of information from which PERSEREC researchers could draw as they prepared the draft CORE list. Researchers were able to cull items from the above publications and re-arrange them in a more systematic way that would make sense to employees in the field.

Development of Draft CORE List of Behaviors

Having reviewed the various policies and related materials listed above and compared and contrasted the strengths and weaknesses of each in terms of clarity and level of detail, PERSEREC researchers developed from the documents a list that included behaviors that should be reported when observed because they are genuine security violations or have serious CI significance. Researchers focused on behavioral items that clearly reflect security and CI risk. Items that were too vague, non-behavioral (e.g., that

required an observer to intuit another person's state of mind), or not clearly associated with a security risk were eliminated.

The draft CORE list was developed in a series of steps, each step building on the previous one. As we sequentially reviewed the documents listed below we added new items not covered in the previous documents until we reached a saturation point where we had captured all items that fell within our selection criteria, i.e., behaviors that are observable and may be associated with a risk to national security. The aim was to construct a list that was simple, short, effective, and credible to the reader. Below are listed the steps we followed in constructing the draft CORE list.

(1) Reviewed DCID 6/4 (13 adjudication guidelines).

(2) Compared DCID 6/4 with DoD Instruction 5240.6 "Counterintelligence Awareness and Briefing Program."

(3) Compared the above two documents with SAEDA regulations and unclassified briefing, "Indicators."

(4) Then added items from PERSEREC's "Employees' Guide to Security Responsibilities."

(5) Then reviewed assorted agency brochures and booklets to see what reportable behaviors might have been missed.

(6) Incorporated all the behaviors culled from the above materials into one list, using as the selection criterion the fact that the behavior clearly should be reported because it is a CI- or security-related violation. The draft CORE list was then carefully reviewed by a panel of five additional researchers at PERSEREC who attempted to eliminate any items that were essentially non-behavioral (e.g., mostly required judgment calls on the part of the potential reporter).

Having developed a draft CORE list, it was important to have it evaluated by professional CI experts.

Evaluation of Draft CORE List by Counterintelligence Experts

In October 2002, the draft CORE list was circulated among the staff of the Joint Counterintelligence Evaluation Office (JCEO) for their review. In turn, JCEO distributed the list to members of the DoD Investigative Working Group (IWG) and to a number of retired FBI officials working for the Counterintelligence Field Activity (CIFA). These individuals provided editorial and substantive comments on the draft CORE list, and their responses were incorporated. The list was then reviewed in April 2003 by CI personnel in the DoD Counterintelligence Directorate under the Office of the Under Secretary of Defense (Intelligence) (OUSD[I]). Directorate staff reviewed the items and made

valuable changes to some. Of PERSEREC's original 30 items, the CI staff advised PERSEREC to reject three, either because the items were not supported by policy or because items raised legal concerns. PERSEREC staff subsequently eliminated these three and eliminated an additional item because it duplicated another. A few items were combined.

Introduction of Draft CORE List into DoD Instruction 5240.6

PERSEREC reviewed an early draft of the new DoD Instruction 5240.6, *Counterintelligence Awareness, Briefing, and Reporting Programs*, dated April 21, 2003, for potential coordination with the CORE list. PERSEREC staff members worked with DoD Counterintelligence Office staff who wrote the instruction and wanted to include PERSEREC's draft CORE list into the new instruction. The instruction was promulgated August 7, 2004.

The instruction, in Item 6 *Procedures*, adds a new section (6.1.) that discusses awareness and briefing programs. It then describes in 6.1.3. the kinds of information that must be included in CI briefings: information about early detection of espionage and other suspected foreign intelligence and terrorist activities; comprehensive tailored threat information focusing on foreign intelligence, terrorism and other threats; information about the DoD anomalies program;[2] and reporting responsibilities and procedures. In Item 6.2, *Reporting Requirements*, the new instruction states (at 6.2.1) that DoD personnel "shall report information pursuant to E.O. 12968 and DoD 5200.2-R…concerning security violations and other information with potentially serious security significance regarding someone with access to classified information employed in a sensitive position." The new instruction refers the reader to an Enclosure 3, where specific behaviors that must be reported are listed. This is an extremely important device that provides the reader explicit examples of reportable behavior.

Item 6.2.2 states "DoD personnel shall expeditiously report any contacts or circumstances that could pose a threat to the security of U.S. personnel, DoD resources, and classified national security information…or controlled unclassified information…" These are relatively vague terms, but then 6.2.3 proceeds to list several explicit counterintelligence circumstances in which contacts must be reported. These include requests of people for unauthorized access to classified information; when contacts may indicate that DoD personnel may be targets for exploitation; contacts with intelligence officers from any country; contacts where information is received about terrorism, espionage, sabotage, subversion, or other intelligence activities; intrusions into U.S. automated information systems; contacts with foreign government interests that may be reportable under separate procedures (e.g., for attaches or arms control negotiators); and other situations where personnel hold sensitive positions and may be required to inform

[2] Pursuant to White House Memorandum, *Early Detection of Espionage and Other Intelligence Activities Through Identification and Referral of Anomalies*, August 23, 1996 and ASD(C3I) Memorandum, *Early Detection of Espionage and Other Intelligence Activities Through Identification and Referral of Anomalies*, October 15, 1996.

Page 2808 of 3957

their commanders of the nature of any intended contact with a foreign diplomatic establishment. For the full wording on the above items, please see Item 6.2, *Reporting Requirements*, on pp. 6-7 of the new instruction.

The new DoD Instruction 5240.6 is creative and forward-looking in that it sets out a specific and explicit set of CI behaviors that should be reported and then refers the reader to Enclosure 3 where a further set of behaviors is listed. Prompted by the CI Directorate's review of PERSEREC's draft CORE, this is the first time that such a list has been included in any such instruction.

DoD Instruction 5240.6, Enclosure 3, contains 14 items taken directly from PERSEREC's CORE list of 16 items. These are behaviors that are clear violations and must be reported immediately; no judgment is required of the person reporting. The CI Directorate added other items to Enclosure 3. These additions were the kinds of items that had initially been rejected by researchers at PERSEREC who recognized such items as potentially security-relevant but: (1) were open to different interpretations that might have little bearing on security, or (2) were behaviors that could not normally be known to a supervisor or coworker. These additional items, several borrowed from the Army's SAEDA list, included volunteering for assignments beyond the normal scope of responsibilities; use of copy machines, faxes or computers to transmit materials that may exceed job requirements; working outside normal duty hours; unexplained or undue affluence; sudden reversal of a bad financial situation or repayment of large debts; attempts to entice DoD personnel into situation that could place them in a compromising position; attempts to place DoD personnel under obligation through special treatment; and short trips to foreign countries or travel within the US for reasons that appear unusual or inconsistent with a person's interests or financial means. Counterintelligence Directorate staff included these items because they have been previously mentioned in policy and have thus traditionally been part of a set of behaviors of possible security concern.

Implementation of CORE Brochure in the Field

After PERSEREC's CORE list was included in policy, PERSEREC transformed it into a brochure for use in the field. The brochure is designed for distribution to DoD components and other departments and agencies that have a need for security education materials and educational tools in the area of supervisor and coworker reporting. It contains the rationale for creating the CORE list so that people using it in the field will understand why items are included. Reportable behaviors are then presented in three major categories: (1) recruitment, (2) information collection, and (3) information transmittal. A fourth section contains a number of discretionary items, i.e., behaviors that are worth noting if one observes them. This fourth section in the brochure is labeled Suspicious Behaviors and is included because the items have long been covered in policy. (Please see the PERSEREC brochure at Appendix B.)

Page 2809 of 3957

Recommendation

DoD should distribute the CORE brochure and its developmental rationale to CI and security agencies for possible implementation. Potential uses include security education briefings of various sorts (e.g., initial, refresher, and CI awareness) and distribution to cleared personnel. By concentrating on direct CI- and security-related behavior, personnel in the field are likely to develop a better understanding of exactly what to report and a greater commitment to reporting it.

INSTRUCTION

NUMBER 5240.6
August 7, 2004

USD(I)

SUBJECT: Counterintelligence (CI) Awareness, Briefing, and Reporting Programs

References: (a) DoD Instruction 5240.6, "Counterintelligence (CI) Awareness and Briefing Program," July 16, 1996 (hereby canceled)
(b) Presidential Decision Directive/NSC No.12,[1] "Security Awareness and Reporting of Foreign Contacts," August 5, 1993
(c) DoD Directive 5240.2, "DoD Counterintelligence (CI)," May 22, 1997
(d) Executive Order 12829, "National Industrial Security Program," January 6, 1993
(e) through (y), see enclosure 1

1. REISSUANCE AND PURPOSE

This Instruction:

1.1. Reissues reference (a), implements reference (b) within the Department of Defense (DoD), and establishes procedures for conducting and administering DoD counterintelligence awareness, briefings and reporting as required by reference (c).

1.2. Provides procedures for the handling of other threat information affecting the security of DoD personnel, information, resources, installations, and operations.

1.3. Reaffirms the requirement for a foreign intelligence and international terrorist threat awareness and briefing programs for DoD military, civilian employee, and contractor personnel.

[1] Authorized users may contact the CI Directorate, DUSD(CI&S), USD(I), Room 3C260, Pentagon for a copy.

Page 2816 of 3957

2. APPLICABILITY AND SCOPE

This Instruction applies to:

2.1. The Office of the Secretary of Defense, the Military Departments, the Chairman of the Joint Chiefs of Staff, the Combatant Commands, the Office of Inspector General of the Department of Defense, the Defense Agencies, the DoD Field Activities, and all other organizational entities in the Department of Defense (hereafter referred to collectively as the "DoD Components").

2.2. DoD contractor personnel with security clearances for their briefing and reporting requirements as specified under E.O. 12829 (reference (d)), (hereafter referred to collectively as "the DoD contractors").

2.3. Active and Reserve military personnel, DoD civilian employees, and DoD contractors (hereafter collectively referred to as "the DoD personnel").

3. DEFINITIONS

Definitions for this Instruction are in enclosure 2.

4. POLICY

It is DoD policy that:

4.1. The DoD personnel report any contact information or circumstances that could pose a threat to the security of U.S. personnel, DoD or other U.S. resources, and classified national security information (hereafter referred to as "classified information"), or controlled unclassified information under E.O. 12958, DoD Directive 5230.24, DoD 5400.7-R, and DoD Directive 5210.83 (references (e) through (h)) to an appropriate authority. Judicial and/or administrative action may be taken when DoD personnel fail to report such required information.

4.2. The DoD personnel shall receive periodic briefings on the threats posed by foreign intelligence services, international terrorists, computer intruders and unauthorized disclosures, and individual reporting responsibilities. This shall include insider threats and the crimes of spying and treason.

5. RESPONSIBILITIES

5.1. The Under Secretary of Defense for Intelligence (USD(I)) shall oversee the DoD Counterintelligence (CI) awareness, briefing, and reporting programs and ensure:

5.1.1. The Deputy Under Secretary of Defense (Counterintelligence and Security) (DUSD(CI&S)) shall establish and sustain the DoD CI awareness, briefing, and reporting programs.

5.1.2. The Director, Counterintelligence, under the DUSD(CI&S), shall:

5.1.2.1. Recommend policy on CI awareness, briefing, and reporting programs to the DUSD(CI&S) and the USD(I).

5.1.2.2. Provide oversight to the DoD CI Program.

5.1.2.3. Participate in DoD and national-level forums concerning CI awareness, briefing, and reporting programs.

5.1.2.4. Serve as the staff point of contact within OSD for issues related to CI awareness, briefing, and reporting programs.

5.1.3. The Director, Counterintelligence Field Activity (CIFA), under the DUSD(CI&S), shall:

5.1.3.1. Manage and provide functional oversight of the Department's CI awareness, briefing, and reporting programs.

5.1.3.2. Brief the USD(I) on significant CI investigative referrals received pursuant to this Instruction in accordance with DoD Directive 5105.67 (reference (i)).

5.1.3.3. Recommend policy changes through the DUSD(CI&S) to the USD(I).

5.1.3.4. Provide additional training to Component CI personnel on the skills required for the CI awareness, briefing, and reporting programs.

5.1.3.5. Represent the Department with other Government and management agencies regarding implementation of all DoD CI matters pursuant to reference (i).

5.1.4. The Director, Defense Security Service, under the DUSD(CI&S), shall recommend changes to DoD 5220.22-M (reference (j)) to the DUSD(CI&S), to implement this Instruction within cleared defense contractor facilities.

5.2. The Heads of the DoD Components shall:

5.2.1. Develop and implement CI briefing, awareness, and reporting programs within their organizations.

5.2.2. Promptly report any CI information developed from these programs to their organic or lead CI agency and to the CIFA pursuant to USD(I) Memorandum, "Reporting Significant Counterintelligence Activity," July 19, 2003 (reference (k)).

5.2.3. Establish time-sensitive reporting procedures pursuant to paragraph 6.3., below, for the DoD personnel during official or non-official overseas travel.

5.2.4. Ensure Component CI agencies report CI information through the Portico system.

5.2.5. Ensure Component CI agency CI information is appropriately documented in the Portico system. Information collected responsive to validated collection requirements shall be published via Intelligence Information Report on the Portico system.

5.3. The Director, Defense Intelligence Agency, shall, in addition to the responsibilities listed in paragraph 5.2., above, and in coordination with the Director, Joint Staff, develop and implement CI awareness, briefing, and reporting programs for the Chairman, Joint Chiefs of Staff.

5.4. Defense Agencies with organic CI organizations shall:

5.4.1. Ensure reported information regarding contractor personnel is referred to the Defense Security Service (DSS) and the Federal Bureau of Investigation (FBI).

5.4.2. Ensure reported information regarding military or DoD civilian personnel is referred to the appropriate Military Department CI agency or the FBI, as appropriate. Any information reported to the FBI shall also be reported to the CIFA pursuant to DoD Instruction 5240.4 (reference (l)).

5.5. The Secretaries of the Military Departments shall:

5.5.1. Ensure Department CI agencies refer reported information regarding contractor personnel to the DSS and the FBI.

5.5.2. Refer reported information regarding DoD civilian employees to the FBI for possible CI investigative or operational action where the Department does not otherwise have investigative authority. Any information reported to the FBI shall also be reported to the CIFA pursuant to reference (l).

6. PROCEDURES

6.1. Awareness and Briefing Programs

6.1.1. The DoD awareness and briefing programs shall promote threat and reporting awareness responsibility, enable DoD personnel to identify CI threats, and the reporting of suspicious situations and incidents to appropriate authorities.

6.1.2. Threat awareness may be enhanced through a variety of methods, including but not limited to publications, posters, live presentations, and recorded media.

6.1.3. CI Briefings shall include:

6.1.3.1. Information about early detection of espionage and other suspected foreign intelligence and international terrorist activities to include the crimes of sabotage, subversion, treason, and spying.

6.1.3.2. Comprehensive, tailored threat information focusing on foreign intelligence, international terrorism, and other threats to include insider threats relevant to the DoD Component's mission, functions, activities and locations.

6.1.3.3. Information addressing the DoD anomalies program pursuant to White House Memorandum, "Early Detection of Espionage and Other Intelligence Activities Through Identification and Referral of Anomalies," August 23, 1996 and Assistant Secretary of Defense (Command, Control, Communications, and Intelligence) Memorandum, "Early Detection of Espionage and Other Intelligence Activities Through Identification and Referral of Anomalies," October 15, 1996 (references (m) and (n)), which remain in effect.

6.1.4. Briefings shall be presented at or near the time of initial entry or hire and thereafter at least every 12 months. More frequent briefing intervals should be instituted if conditions warrant. Some DoD Component organizations or personnel may require more frequent briefings predicated on the nature of their duties.

6.1.5. Briefings should be presented by the Component CI agency when feasible. If the servicing Component CI agency is not used, the briefings should be coordinated with them for content and accuracy.

6.1.6. Briefings conducted pursuant to this Instruction do not satisfy the requirement of DoD Directive 2000.12 (reference (o)).

6.2. Reporting Requirements

6.2.1. The DoD personnel shall report information pursuant to E.O. 12968 and DoD 5200.2-R (references (p) and (q)) concerning security violations and other

information with potentially serious security significance regarding someone with access to classified information or who is employed in a sensitive position. Examples of information or observed behaviors that should be reported are listed in enclosure 3.

6.2.2. Pursuant to this Instruction, the DoD personnel shall expeditiously report any contacts or circumstances that could pose a threat to the security of U.S. personnel, DoD resources, and classified national security information or controlled unclassified information to an appropriate DoD authority.

6.2.2.1. Appropriate authorities for active duty and Reserve military personnel and DoD civilians and DoD contractors working in DoD Component facilities include security officers, supervisors, commanders, and organic or lead CI agencies. Security officers, supervisors, and commanders shall expeditiously refer any information they receive pursuant to this Instruction to their supporting CI agency.

6.2.2.2. Appropriate authorities for DoD contractors at cleared contractor facilities shall include Facility Security Officers, Military Department CI Agencies, the FBI, or the DSS pursuant to reference (l).

6.2.3. The DoD personnel shall report contacts pursuant to the following situations:

6.2.3.1. A request by anyone, regardless of nationality, for unauthorized access to classified information under DoD 5200.1-R (reference (r)); controlled unclassified information under references (f), (g), and DoD Directive 5230.25 (reference (s)); or information systems containing such information.

6.2.3.2. Contact with an individual, regardless of nationality, under circumstances that suggest the DoD personnel may be the target of an attempted exploitation by a foreign intelligence service or international terrorist organization.

6.2.3.3. Contact with a known or suspected intelligence officer from any country.

6.2.3.4. Contact with anyone receiving information of planned, attempted, actual, or suspected international terrorism, espionage, sabotage, subversion, or other intelligence activities against the Department of Defense, other U.S. facilities, U.S. organizations, or U.S. citizens.

6.2.3.5. Actual or attempted unauthorized access into U.S. automated information systems and/or unauthorized transmissions of classified or controlled unclassified information over on-line computer services and telephones.

6.2.3.6. Close and continuing associations with foreign nationals may also be reportable under Director of Central Intelligence Directive (DCID) 6/1, reference (t) and DCID 6/4, reference (u).

6.2.3.7. In addition to the aforementioned reporting requirements, personnel who occupy positions designated by their DoD Component as sensitive shall apprise their commanders or supervisors of the nature and purpose of any intended contact with any foreign diplomatic establishment whether in the United States or abroad.

6.3. Sanctions. The DoD personnel who fail to report information required by this Instruction may be subject to judicial and/or administrative action under applicable law and regulations, including the Uniform Code of Military Justice (reference (v)), and other applicable sections of the United States Code.

6.4. Other

6.4.1. DoD acquisition program personnel working with Critical Program Information pursuant to DoD Directive 5200.39 (reference (w)) shall notify their servicing security personnel of all projected foreign travel. Such personnel shall receive foreign intelligence threat briefings and anti-terrorism briefings prior to overseas travel.

6.4.2. The DoD personnel with access to Sensitive Compartmented Information (SCI) pursuant to DCID 1/20 (reference (x)) incur special security obligations that include advance foreign travel notification for official and/or unofficial travel and defensive travel briefings.

7. EFFECTIVE DATE

This Instruction is effective immediately.

Stephen A. Cambone
Under Secretary of Defense for Intelligence

E2. ENCLOSURE 2

DEFINITIONS

E2.1. DEFINED TERMS

E2.1.1. Anomalies. Foreign power activity or knowledge suggesting foreign knowledge of U.S. national security information, processes or capabilities.

E2.1.2. Classified Information. Information requiring protection in the interest of national security, classified "TOP SECRET, SECRET, or CONFIDENTIAL" according to reference (x).

E2.1.3. Contact. Any form of meeting, association, or communication in person; by radio, telephone, letter, computer; or other means, regardless of who initiated the contact for social, official, private, or other reasons.

E2.1.4. Controlled Unclassified Information. Data bearing distribution limitation statements such as "For Official Use Only" in accordance with reference (g) and other information marked under references (f) and (g).

E2.1.5. Counterintelligence. Information gathered and activities conducted to protect against espionage, other intelligence activities, sabotage, or assassinations conducted for or on behalf of foreign powers, organizations, or persons, or international terrorist activities, but not including personnel, physical, document, or communications security programs.

E2.1.6. Counterintelligence Investigations. Are conducted to prove or disprove an allegation of espionage or other intelligence activities, such as sabotage, assassination, or other national security crimes conducted by or on behalf of a foreign government, organization, or person or international terrorists. CI investigations may establish the elements of proof for prosecution or administrative actions, provide a basis for CI operations, or validate the suitability of personnel for access to classified information. CI investigations are conducted against individuals or groups for committing major security violations, as well as failure to follow Defense Agency and Military Department directives governing reporting contacts with foreign citizens and out-of-channel requests for defense information. CI investigations provide military commanders and policymakers with information used to eliminate security vulnerabilities and otherwise improve the security posture of threatened interests.

E2.1.7. Defensive Travel Briefings. Formal advisories alerting personnel of the potential for harassment, exploitation, provocation, capture, or entrapment while traveling. These briefings, based on actual experience when available, include

information on courses of action helpful in mitigating adverse security and personnel consequences and advise of passive and active measures that personnel should take to avoid becoming targets or inadvertent victims as a consequence of hazardous travel.

E2.1.8. DoD Component CI Organizations. The organic CI elements of the Army, the Navy, the Air Force, the Marine Corps, the Joint Staff, the Combatant Command Staffs, the Defense Intelligence Agency, the National Security Agency, the National Geospatial-Intelligence Agency, the National Reconnaissance Office, the Defense Security Service, the Defense Threat Reduction Agency, and the Missile Defense Agency and the CIFA.

E2.1.9. Espionage. Defined under Sections 792-799, Chapter 37, title 18, United States Code (reference (y)) and Article 106a, Uniform Code of Military Justice (UCMJ) (reference (v)).

E2.1.9.1. Espionage is the act of obtaining, delivering, transmitting, communicating, or receiving information about the national defense with an intent or reason to believe that the information may be used to the injury of the United States or to the advantage of any foreign nation. The offense of espionage applies during war or peace.

E2.1.9.2. Reference (y) makes it an offense to gather, with the requisite intent or belief, national defense information, by going on, entering, flying over, or obtaining access by any means to any installation or place used by the United States for national defense. The method of gathering that information is immaterial.

E2.1.9.3. Anyone who lawfully or unlawfully is entrusted with or otherwise has possession of, access to, or control over information about national defense, which he or she has reason to believe could be used against the United States or to the advantage of any foreign nation, and willfully communicates or transmits, or attempts to communicate or transmit, such information to any person not entitled to receive it may be punished under reference (y).

E2.1.9.4. Anyone entrusted with or having lawful possession or control of information about national defense, who through gross negligence permits the same to be lost, stolen, abstracted, destroyed, removed from its proper place of custody, or delivered to anyone in violation of that trust may be punished under reference (y).

E2.1.9.5. If two or more persons conspire to commit and one of them commits an overt act in furtherance of such conspiracy, all members of the conspiracy may be punished for violation of reference (y).

E2.1.10. Foreign Diplomatic Establishment. Any embassy, consulate, or interest section representing a foreign country.

E2.1.11. Lead CI Agency. A Military Department CI Agency that has been designated by the USD(I) to provide defined levels of CI support to one or more of the DoD Components.

E2.1.12. Military Department CI Agencies. The Military Department CI Agencies include the U.S. Army Counterintelligence, the Naval Criminal Investigative Service, and the Air Force Office of Special Investigations.

E2.1.13. National Security. A collective term encompassing both national defense and foreign relations of the United States.

E2.1.14. Portico. A program managed by the CIFA to provide automation support, through web-enabled software hosted on a robust infrastructure, to the DoD CI Community. Portico enables CI enterprise business processes; facilitates information sharing, and coordination across DoD Services and Agencies; and provides management tools for each CI functional area, as well as supporting tools and services for managing the CI process in the functional areas of Collection; Investigations; Analysis and Production; Operations; and CI Functional Services.

E2.1.15. Sabotage. An act or acts with the intent to injure or interfere with, or obstruct the national defense of a country by willfully injuring, destroying, or attempting to destroy any national defense or war materiel, premises or utilities to include human or natural resources, under reference (y).

E2.1.16. Spying. During wartime, any person who is found lurking as a spy or acting as a spy in or about any place, vessel or aircraft, within the control or jurisdiction of any of the Armed Forces or in or about any shipyard, any manufacturing or industrial plant, or any other place or institution engaged in work in aid of the prosecution of the war by the United States, or elsewhere.

E2.1.17. Subversion. An act or acts inciting military or civilian personnel of the Department of Defense to violate laws, disobey lawful orders or regulations, or disrupt military activities with the willful intent thereby to interfere with, or impair the loyalty, morale, of discipline, of the Military Forces of the United States.

E2.1.18. Terrorism. The calculated use of violence or threat of violence to inculcate fear; intended to coerce or to intimidate governments or societies in the pursuit of goals that are generally political, religious, or ideological.

E2.1.19. Treason. Whoever, owing allegiance to the United States, levies war against them or adheres to their enemies, giving them aid and comfort within the United States or elsewhere, is guilty of treason (see Section 2831 of title 18, U.S. Code, reference (y)).

E2.1.20. Unauthorized Disclosure. A communication or physical transfer of classified information to an unauthorized recipient.

E3. ENCLOSURE 3

EXAMPLES OF REPORTABLE EMPLOYEE BEHAVIORS

E3.1. LIST OF REPORTABLE EMPLOYEE BEHAVIORS

E3.1.1. Unauthorized contact with an individual who is known or suspected of being associated with a foreign intelligence, security, or terrorist organization.

E3.1.2. Illegal activity, conduct or requests for participation in illegal activities or other conduct that might make someone susceptible to blackmail or result in a security violation.

E3.1.3. Reading or discussing classified or controlled unclassified information in an unauthorized location, such as while using public transportation.

E3.1.4. Attempts to obtain classified or other protected information in any format to which the requesting person does not have authorized access.

E3.1.5. Requests for witness signatures certifying the destruction of classified information when the witness did not observe the destruction.

E3.1.6. Unauthorized possession and/or operation of cameras, recording devices, computers, or modems in areas wherein classified information and data are stored, discussed, or processed.

E3.1.7. The existence or use of any unauthorized listening or surveillance devices in sensitive or secure areas.

E3.1.8. Keeping classified material at home or any other unauthorized place.

E3.1.9. Acquiring access to classified or unclassified automated information systems without proper authorization.

E3.1.10. Transmitting classified material over unclassified FAX or computer.

E3.1.11. Seeking to obtain access to sensitive information inconsistent with present duty requirements.

E3.1.12. Removing classified or controlled unclassified material from work areas without appropriate authorization by any means.

E3.1.13. Improperly removing security classification markings from documents.

E3.1.14. Discussing classified information on a non-secure, unencrypted telephone.

E3.1.15. Attempts to expand access to classified information by repeatedly volunteering for assignments or duties beyond the normal scope of responsibilities.

E3.1.16. Extensive use of copy, facsimile, or computer equipment to reproduce or transmit classified material that may exceed job requirements.

E3.1.17. Repeated or un-required work outside of normal duty hours, especially unaccompanied.

E3.1.18. Unexplained or undue affluence, including sudden purchases of high value items (i.e., real estate, stocks, vehicles, or vacations) where no logical income source exists. Attempts to explain wealth by reference to inheritance, luck in gambling, or some successful business venture.

E3.1.19. Sudden reversal of a bad financial situation or repayment of large debts.

E3.1.20. Attempts to entice DoD personnel into situations that could place them in a compromising position.

E3.1.21. Attempts to place DoD personnel under obligation through special treatment, favors, gifts, money or other means.

E3.1.22. Short trips to foreign countries or travel within the United States to cities with foreign diplomatic activities for reasons that appear unusual or inconsistent with a person's interests or financial means.

COUNTERINTELLIGENCE REPORTING ESSENTIALS (CORE)

A Practical Guide for Reporting Counterintelligence and Security Indicators

Defense Personnel Security Research Center (PERSEREC)

Page 2834 of 3957

INTRODUCTION

Supervisors and coworkers are the first line of defense against espionage. The government relies on you to protect national security by reporting any behavior that you observe that may be related to a potential compromise of classified information. You are encouraged, sometimes obliged, by Executive Order, Presidential Decision Directive and U.S. Code, as well as by DoD Directives, Regulations, Instructions, to report such behaviors. However, judgment calls are often required by the potential reporter, and this often leads to indecision or choosing not to report anything.

Therefore, presented below is a focused list of serious counterintelligence- and security-related behaviors that, if observed or learned about, should be reported immediately to appropriate counterintelligence or security authorities. All these behaviors are serious and require little or no speculation.

Upon receiving your report, a security professional will follow up with appropriate verification. If you are at all uncertain, it is better to err on the side of reporting than not. The counterintelligence and security people will know how to handle your report.

The list of behaviors is not intended to be exhaustive. You should report any additional observed behaviors that may parallel or exceed the concerns listed in this brochure.

The brochure can be used by supervisors, coworkers, and security professionals in initial and refresher briefings and in counterintelligence briefings. By concentrating on direct counterintelligence- and security-related behavior, personnel in the field are likely to develop a better understanding of exactly what to report and a greater commitment to reporting it.

If you want only the CORE items,
print the last four pages of this document.

Page 2835 of 3957

BACKGROUND

The Defense Personnel Security Research Center (PERSEREC) conducted research on how employees with clearance access understand the requirements to report suspicious behavior that they observe.*

Finding: Supervisors and coworkers are willing to report on behaviors that have a clear connection to security, such as transmitting classified documents to unauthorized personnel, but they are unwilling to report on colleagues' personal problems, such as alcohol abuse. Because it was difficult to discern which reporting requirements were clearly related to security, there was very little reporting.

Outcome: PERSEREC, in collaboration with counterintelligence professionals, developed a clear, succinct list of "Coworker Reporting Essentials" (CORE) behaviors that could pose a possible threat to national security and thus should be reported if observed. The draft CORE was reviewed and edited by counterintelligence professionals at the Counterintelligence Field Activity (CIFA), and was coordinated by the DoD Investigative Working Group (IWG).

PERSEREC also coordinated with the DoD Counterintelligence Directorate in the Office of the Under Secretary for Defense (Intelligence), who included the PERSEREC CORE list in DoD Instruction 5240.6, *Counterintelligence Awareness, Briefing, and Reporting Programs.*

*Wood, S., & Marshall-Mies, J.C. (2003). Improving supervisor and coworker reporting of information of security concern. Monterey, CA: Defense Personnel Security Research Center.

Page 2836 of 3957

COUNTERINTELLIGENCE REPORTING ESSENTIALS (CORE)

If you become aware of any of the following behaviors or activities, you should report them to your security officer or supervisor. These behaviors are derived from the DoD Instruction 5240.6 *Counterintelligence Awareness, Briefing, and Reporting Programs.*

RECRUITMENT

Foreign intelligence entities are on the lookout for people who can be solicited to commit espionage against the U.S. At the same time, willing would-be spies often approach foreign intelligence operatives on their own initiative, thus volunteering for recruitment. It is a major task of counterintelligence to intercept these relationships. The recruitment cycle requires, first, that contact be established between the foreign intelligence agency and the potential spy, whether by direct recruitment or by volunteering. While the recruitment relationship almost always involves contacts with foreigners, an already-committed U.S. spy may approach you or a colleague on the job for recruitment into espionage.

Reportable Behaviors

- you become aware of a colleague having contact with an individual who is known to be, or is suspected of being, associated with a foreign intelligence, security, or terrorist organization.

- you discover that a colleague has not reported an offer of financial assistance by a foreign national other than close family.

- you find out that a colleague has failed to report a request for classified or unclassified information outside official channels to a foreign national or anyone without authorization or need to know.

- you become aware of a colleague engaging in illegal activity or if a colleague asks you to engage in any illegal activity.

Page 2837 of 3957

INFORMATION COLLECTION

Before classified or other kinds of sensitive materials can be passed to a foreign intelligence agency, they must be collected. They can simply be stolen (e.g., paper placed in a briefcase and taken out of the office), photographed, collected via computers, or obtained through eavesdropping or other surveillance devices. The computer age, with its e-mail and database capabilities, has offered new opportunities to potential spies for collecting data. While technical countermeasures can control some situations, it is up to coworkers to watch for and, if possible, identify breaches in the system that allow classified and sensitive information to be collected for espionage purposes.

Reportable Behaviors

- . . a colleague asks you to obtain classified or other protected information in any format to which the person does not have authorized access.

- . . a colleague asks you to witness signatures for destruction of classified information when you did not observe the destruction.

- . . you observe a colleague operating unauthorized cameras, recording devices, computers, or modems in areas where classified data are stored, discussed, or processed.

- . . you become aware of the existence of any listening or surveillance devices in sensitive or secure areas.

- . . you find out that a colleagues has been keeping classified material at home or any other unauthorized place.

- . . you discover a colleague acquiring access to classified or unclassified automated information systems without authorization.

- . . you observe a colleague seeking to obtain access to sensitive information inconsistent with present duty requirements.

Page 2838 of 3957

INFORMATION TRANSMITTAL

In former days the transmittal of classified or sensitive information took the form of stealing documents and physically handing them to the foreign intelligence agent. In addition, spies could photocopy paper materials, smuggle materials out in briefcases, even illicitly take photographs in the workplace. Nowadays, there are many more opportunities to transmit information. With the advent of e-mail, faxes, and other technological capabilities, it is possible to transmit large quantities of information without being immediately caught. Coworkers must be aware of this problem and, if an illicit transmission is detected, report it directly and immediately to the designated cognizant counterintelligence or security authorities.

Once a relationship with a foreign intelligence agent is established and information begins to flow, illicit trips abroad by the recruited spy usually follow (meetings are easier to arrange abroad than in the U.S.). These journeys are often concealed by the person and the foreign contact is not reported. If you learn of such journeys or contacts, you should report.

Reportable Behaviors

- you see someone removing classified material from the work area without appropriate authorization, either by physically taking it home or on travel, or by e-mailing or faxing it out of the office. The same rule applies for other protected materials, such as export-controlled or proprietary items.

- you observe a colleague using unclassified FAX or computer to transmit classified material.

- you observe a person improperly removing the classification markings from documents.

- you hear a colleague discussing classified information on a nonsecure telephone.

- you become aware that people with TS/SCI or contractors with a reporting requirement have attempted to conceal any work-related foreign travel and any personal foreign travel.

Page 2839 of 3957

SUSPICIOUS BEHAVIORS

The new DoD Instruction 5240.6, *Counterintelligence (CI) Awareness, Briefing, and Reporting Programs* (August 7, 2004) lists an additional series of eight items that, while not exactly clear-cut violations, have been traditionally considered behaviors that may well be connected to counterintelligence and security problems. These behaviors do require some degree of judgment before reporting. Often you might not know about them directly but only by hearsay. Often they may easily carry plausible alternative explanations. They are included here with the caveat that they do require a judgment call before reporting. If you are at all uncertain, it is better to report the behavior than to make no report at all.

> Attempts to expand access to classified information by repeatedly volunteering for assignments or duties beyond the normal scope of responsibilities.

> Extensive use of copy, facsimile, or computer equipment to reproduce or transmit classified material that may exceed job requirements.

> Repeated or un-required work outside of normal duty hours, especially unaccompanied.

> Unexplained or undue affluence, including sudden purchases of high value items (e.g., real estate, stocks, vehicles, or vacations) where no logical income source exists. Attempt to explain wealth by reference to inheritance, luck in gambling, or some successful business venture.

> Sudden reversal of financial situation or sudden repayment of large debts or loans.

>Attempts to entice DoD personnel into situations that could place them in a compromising position.

> Attempts to place DoD personnel under obligation through special treatment, favors, gifts, money, or other means.

>Short trips to foreign countries or travel within the United States to cities with foreign diplomatic activities for reasons that appear unusual or inconsistent with a person's interests or financial means.

13. ABSTRACT (maximum 200 words)

This thesis combines regression, sentiment, and social network analysis to explore how Russian online media agencies, both overt and covert, affect online communication on Twitter when North Atlantic Treaty Organization (NATO) exercises occur. It explores the relations between the average sentiment of tweets and the activities of Russia's overt and covert online media agencies. The data source for this research is the Naval Postgraduate School's licensed Twitter archive and open-source information about the NATO exercises timeline. Publicly available lexicons of positive and negative terms helped to measure the sentiment in tweets. The thesis finds that Russia's covert media agencies, such as the Internet Research Agency, have a great impact on and likelihood for changing the sentiment of network users about NATO than do the overt Russian media outlets. The sentiment during NATO exercises becomes more negative as the activity of Russian media organizations, whether covert or overt, increases. These conclusions suggest that close tracking and examination of the activities of Russia's online media agencies provide the necessary base for detecting ongoing information operations. Further refining of the analytical methods can deliver a more comprehensive outcome. These refinements could employ machine learning or natural language processing algorithms that can increase the precision of the sentiment measurement probability and timely identification of trolls' accounts.

ACKNOWLEDGMENTS

This thesis would not be possible without the tireless work of the teachers and instructors from the Defense Analysis Department of the Naval Postgraduate School. I am particularly grateful to my advisors Professor T. Camber Warren and Professor Shannon Houck, for their dedication and patience during my research. In addition, I am also thankful to the people in the International Graduate Program Office for the exceptional support that they provide for the international students.

I. INTRODUCTION

In recent years, social media has become significantly important as a source of information and means of communication. Many people worldwide have an account on at least one social media platform. Such platforms created a new environment, which enormously simplified exchanging ideas, messages, and knowledge. However, it also becomes a channel for manipulation, deception, and proliferation of extremist and radical ideologies. The popularity of such online services creates opportunities for state and non-state actors to manipulate a society's values and beliefs. The online media platforms become both a target and source of information campaigns to manipulate public perception. Governments worldwide work actively to develop online capabilities for influence to strengthen their power and accomplish their political agendas. Examples of such influence are the Russian government's online campaign against Ukraine in 2014[1] and campaigns by ISIS[2] and the Taliban[3] using social media to communicate their messages to target audiences.

These examples also demonstrate that the main actors in information operations operate overtly or covertly when influencing the targeted audiences. Official media agencies or journalists known for their affiliation to such outlets can openly deliver part of the narratives in such operations. However, this affiliation can affect their credibility and diminish the effects of the information operation. In contrast, media organizations that use covert methods can avoid being attributed to the source of the campaign, primarily by using fake online accounts. Therefore, they can infiltrate different communities to affect their online communication. Most importantly, they do not just push narratives that are in line

Page 2859 of 3957

with the official position of their state or organization. They can employ more aggressive methods and deliberately disseminate misleading, false, or divisive information to create in the targeted society disorientation and social confrontation. Consequently, both overt and covert media organizations significantly contribute to the overall effect of information operations. Their role in such activities needs exploring and constant monitoring to employ proper countermeasures. National security agencies need to develop the capacity to counter such online information campaigns. Successful and efficient counteraction depends on the reliable identification of the sources of information attacks, their target audiences, and their strategic messages.

However, researchers usually employ a single analytical method when exploring online information operations. For example, some of the most common methods include temporal analysis, data mining, or social network analysis.[4] This lack of an integrated approach delivers only partial results about the overall picture in the information campaign and prevents proper countermeasure planning. Thus, this thesis demonstrates that combining statistical analysis, social network analytic tools, text mining, and sentiment analysis can improve this approach. It shows that these methods provide the necessary results to build models that can explore the role of the different actors in information operations. This thesis's more comprehensive approach can increase the probability of timely identification of ongoing information operations, their audiences, main actors' probable location(s), and contribution to the overall effect of the operation. This research has great potential for improvement by adding new methods to the analysis. For example, machine learning algorithms can increase the precision of sentiment measurement. Additionally, dynamic network analysis and natural language processing can identify the most important topics in the online conversation and who contributes to these topics.

This thesis focuses on the online conversation on Twitter about the North Atlantic Treaty Organization (NATO), by examining the effects of military exercises over the

[4] Kai Shu et al., *Fake News Detection on Social Media: A Data Mining Perspective*, vol. 19, 2017, https://arxiv.org/pdf/1708.01967.pdf; Xinyi Zhou et al., "Fake News: Fundamental Theories, Detection Strategies and Challenges," in *Proceedings of the Twelfth ACM International Conference on Web Search and Data Mining* (WSDM '19: The Twelfth ACM International Conference on Web Search and Data Mining, Melbourne VIC Australia: ACM, 2019), 836–37, https://doi.org/10.1145/3289600.3291382.

2013–2014 time period. It explores the relations between the average sentiment of messages in this online conversation and the activities of Russia's overt and covert online media agencies. The thesis's most important findings are that the messages generated by Russia's covert agencies have a more substantial impact on the probability of sentiment change than those of the overt Russian media. Furthermore, the study finds that both the overt and the covert Russian actors more effectively influence positive rather than negative sentiments. Nevertheless, the evidence also shows that sentiment during NATO exercises becomes more negative as the activity of Russian covert media organizations increases. Furthermore, this thesis finds that during NATO exercises the trend toward negative sentiments increases if the sender's location is closer to the borders of the Russian Federation. Finally, this study also finds that activity by the Internet Research Agency (IRA), a covert Russian social media influencer agency, and Russian media during NATO exercises increases the daily network size of users engaged in the NATO conversation, and this network becomes more interconnected. When NATO exercises occur, Russian media activities tend to increase the centralization of the daily network. By contrast, the IRA seems to operate as a more "egalitarian" network of small teams with a similar number of ties.

II. LITERATURE REVIEW

A. INFORMATION OPERATIONS AND SOCIAL MEDIA

The major actors on the international political stage, such as the United States, Russia, and China, have similar views about confrontation that unfolds in the form of information. Whether they define it as an information operation or information warfare, its primary goals are to influence the adversary's political and military leadership's decision-making process, reduce the enemy's morale, and tarnish the population's confidence in its leaders and institution. All three countries acknowledge that this type of confrontation has multidimensional characteristics because it targets physical, informational, and cognitive aspects of the information environment. The Joint Chiefs of Staff's JP3-13 provides details the U.S. concept of information operations,[5] while I. N. Panarin presents the Russian view and provides that country's definitions for information warfare (*Russ. informacionnoe protivoborstvo*) and its primary goals.[6] In turn, Paul Charon and Jean-Baptist Jeangène Vilmer[7] provide extensive details about China's concept of information operations, examine multiple case studies, and explain how Beijing studies and exploits the lessons learned from the Russian and U.S. military campaigns. In addition to the work of Charon and Jeangène Vilmer, Nathan Beauchamp-Mustafaga and Michael Chase[8] and Elsa Kania[9] can provide complementary insight into the Chinese concept of "the Three Warfares"—psychological warfare, public opinion warfare, and legal warfare.

Page 2863 of 3957

Researchers examining the organization and capabilities of the Russian media propaganda machine explain that it has overt and covert components. The former encompasses the vast network of media outlets and news agencies whose editorial policies are under the Kremlin's direct control.[10] Monica Hanley and Andrey Kuzichkin provide valuable details about the organization of the Russian media landscape, the major media holding companies, and who owns them. The authors show that these media networks receive funds from some of the largest Russian state or private corporations such as Gazprom, VneshTorgBank, and Severstal. The authors also describe the specialized administrative structures that support the Russian media operations and the role of the Russian presidential administration in this process.

Similarly, Tod Helmus finds that the Kremlin uses its nexus of media companies in congruence with covert assets such as online trolls and bots.[11] He explores the difference in Moscow's tactics in the countries close to its borders and those far away. In the 'far abroad' states, Helmus observes that the Kremlin identifies radical or extremist groups from the conservative or liberal spectrum, tries to reinforce their extreme political views, and then provokes a conflict between them. In contrast, in the 'near abroad,' the targets are typically Russian ethnic and language minorities, Orthodox religious communities, or those with a shared memory about historical events.[12] In this light, Vasile Rotaru examines Moscow's "soft power" in the countries bordering Russia and provides details on the potential role of such groups in Russian influence operations.[13]

Page 2864 of 3957

The covert component of the Russian information operation capabilities includes groups such as the IRA that have used concealed actions to disseminate disinformation or employ divisive tactics among their target audiences. These IRA activities have attracted the attention of the scientific community worldwide. In particular, two events have primarily captured the researchers' focus: the 2016 U.S. presidential elections and the protest movement #BlackLivesMater (BLM).

Ahmer Arif et al.[14] demonstrate that during the BLM protests, the IRA used "Twitter and other online platforms to infiltrate politically active online communities." An important finding is that the IRA agents focused their efforts to manipulate the pro-BLM audience and those against the protest movement. Moreover, the Russian trolls' activities went beyond simply spreading disinformation on social media, as they were able to "connect to the cultural narratives, stereotypes, and political positions" of their target audiences." The authors point out that the IRA activities rely on three different components. The first is "the affordances of the online environment," or the inherent characteristics of Twitter and the other social media that define how the users use them. The second is "the social structures and behaviors of the online crowd," or the targeted audience's subgroups, hierarchy, or leaders and how they interact with each other. The third is "the improvised performances of agents that seek to leverage that crowd," or the actual actions to influence the target audience.

Similar findings are presented by Darren Linvill and Patrick Warren, who categorize IRA accounts into five general types: Right Troll, Left Troll, News Feed, Hashtag Gamer, and Fearmonger.[15] These authors observe that "within each type, accounts were used consistently, but the behavior across types was different, both in terms of

[14] Ahmer Arif, Leo Graiden Stewart, and Kate Starbird, "Acting the Part: Examining Information Operations Within #BlackLivesMatter Discourse," *Proceedings of the ACM on Human-Computer Interaction* 2, no. CSCW (November 2018): 1–27, https://doi.org/10.1145/3274289.

Page 2865 of 3957

'normal' daily behavior and in how they responded to external events."[16] They compare the Internet Research Agency's organization to industrial enterprises that use "interchangeable parts" with specialized functions to achieve political goals.

Philip Howard et al. reveal how the IRA's activities sought to polarize U.S. society during the 2016 presidential election by engaging primarily far-conservative and far-liberal communities on social media. Specifically, the authors used qualitative and quantitative analysis to demonstrate that IRA operations targeted "African American voters to boycott elections or follow the wrong voting procedures" and incited "extreme right-voters to be more confrontational." [17]

Congressional hearings questioning social media companies' officials[18] regarding the Kremlin meddling in the U.S. election process and court indictments against IRA-linked individuals[19] also provide an important source of detailed information about the IRA's structure, leadership, and activities. During the hearings, a Twitter representative revealed that more than 47% of the IRA accounts were automated. In addition, he confirmed that Russian media company RT purchased ads that promoted election-related content that Twitter identified as being "inflammatory or low-quality."[20] The court indictment details the IRA's owners, management, departments, activities, and budget.

Information operations have different manifestations, and they often result in "distraction, distortion, dismay, and disruption"[21] in the public perceptions of specific communities or the society in a given country as a whole. David Beskow and Kathleen Carley's research demonstrates that these activities could be message-driven or network-driven.[22] Message-driven and network-driven activities differ in their targets. The former aims at a public perception by spreading inaccurate or divisive information.[23] The latter aims to affect group dynamics by manipulating the target's social ties. For example, network-driven messages focus on removing a group's less radical opinion to transform it into a polarized echo chamber.[24] As a result, the main goal of the researchers studying information operations is to examine the dynamics of these processes and "to classify adversarial actors and their activities, assess and predict their impact, and design effective strategies for intervention and building the resilience of online communities."[25]

In addition, studies of information operations conducted through the internet agree that the dissemination of disinformation or fake news is their most recognizable feature, and how to detect them is the central question that needs an answer. The researchers approach this problem from different perspectives. For example, the data-oriented approach explores online communication by analyzing messages and their social context. Knowledge perspective fake-news detection compares verified news articles to knowledge

in a trustworthy database.[26] The knowledge perspective fake-news detection method compares verified news articles to knowledge in a trustworthy database, while style-based detection captures "the differences in writing styles between fake and accurate news."[27] Another approach, the propagation perspective, explores the dissemination path of the news and indirectly detects fake news by assessing the credibility of the headlines, publishers, comments, and users.

Data mining, machine learning, and natural language processing methods are the major tools in implementing these approaches. Each tool differs from the others in its strategies, datasets, and techniques.[28] They are described in more detail in the following section of this thesis.

Other researchers correctly observe that combining these approaches may yield better results. Joshua Uyheng et al.[29] put the concept of social cyber-security and interoperability at the center of their work. Social cyber-security is "a multidisciplinary and multimethodological field that studies how to preserve the Internet as a free and open space for the exchange of information." [30] Carley and Beskow further examine how technology change and decentralization of information flow enables the emergence of social cyberthreats.[31] They explain that "technology has waived the requirement for physical proximity to influence society; and, the decentralization of information flows has reduced the cost of entry."[32]

The analysis of "online content polluters, such as bots and trolls,"[33] has an important place in the field of social cyber-security. They both spread aggressive or disruptive messages. It should be noted that in contrast to trolls who are humans, bots are automated accounts.[34] The success of these "online polluters" has both technological and sociopsychological aspects. Thus, social cyber-security researchers have to combine methods in both computational social sciences.

Several prior Naval Postgraduate School (NPS) theses have also focused on social media to study influence in the information environment. For example, Eric Chan explored Russian influence operations and the historical background of IRA activity.[35] Meanwhile, James Morales provided valuable information on how to use tweets' sentiment analysis for assessing the anti-American mood in Pakistan and Japan. Particularly interesting is his study on how public perceptions change due to U.S. exercises in Japan.[36] Greg Selph et al. examine the relation between the civil conflicts in Nigeria, the Philippines, and Pakistan and the change in sentiment of tweets. The authors provide a valuable assessment of the significance of sentiment analysis for studying social media.[37]

B. METHODS OF STUDYING INFORMATION OPERATIONS

The most frequently used methods for analyzing information operations are dynamic network analysis, natural language processing, and machine learning. Machine

learning algorithms are very efficient in the automatic identification of fake accounts and bots in online conversations.[38] These algorithms are applied to aggregated datasets to discover patterns in bots' messaging behavior or relationships with other social network nodes. Uyheng et al. claim that "given a reasonably large dataset of a labeled bot and non-bot accounts, predictive models can be trained to discriminate between each type of account with decent accuracy ($\geq$ 90%) across various contexts."[39] Other studies demonstrate that detecting trolling and opinion manipulation in news community forums and Twitter can use online messages' textual features.[40] When studying online information operations, another critical task is identifying the topics or central messages of the targeted conversations. Techniques such as topic modeling allow researchers to capture the core ideas and reveal critical aspects of a disinformation campaign. For example, the Latent Dirichlet Allocation (LDA) algorithm can extract topics from a corpus of texts using natural language processing.[41] Finally, dynamic network analysis provides quantitative methods to test hypotheses about users' influence in an online conversation. It analyzes how their characteristics and behavior change over time and how they interact. For example, on Twitter, the study of users' features and their ties (how they retweet, reply, or are mentioned) can deliver "more complex insights into online discourse."[42]

Uyheng et al.[43] convincingly demonstrate that these methods can discover patterns in Twitter users' behavior attributed to online information campaigns during NATO

Page 2870 of 3957

exercises. They apply LDA to determine what topics are prevalent in Twitter communication when NATO exercises occur and how they change over time. Next, the researchers explore the features of Twitter accounts to classify them as bots or not. For this purpose, they use a random forest machine learning model such as Bothunter.[44] In parallel, the authors employ different neural networks trained on a dataset of user descriptions for role identification (e.g., if the users are news agencies, reporters, and others) and for location prediction. In the end, they use an Organization Risk Analyzer (ORA) for individual and network drill-down to identify influential users, characterize the Twitter conversation's overall structure, and visualize the results. Uyheng et al.'s approach shows that combining computational tools can better analyze information operations in social media, as this approach can gain more complex insights into participants and their messages than single tools can.

Nonetheless, these results could be improved further by integrating different analytical tools or methods, such as sentiment analysis (especially in languages other than English), regression analysis, and network topology metrics' calculation. The change in the sentiment of tweets can play the role of a dependent variable in regression models to establish which factors have a statistically significant influence. The calculation of different topology metrics of the users' social network can reveal how its characteristics, such as centralization or interconnectedness, change under specific factors. This thesis complements the earlier analysis of the Russian covert and overt media agencies' role in influencing the information environment during NATO exercises in Europe. It combines regression, sentiment, and social network analyses to determine systematically how significant political-military events such as Allied exercises affect social media users' perceptions.

III. INFORMATION WARFARE: THE BEAR AND THE DRAGON

A. INFORMATION CONFRONTATION, INFORMATION WARFARE, AND INFORMATION OPERATIONS

The development of information technologies has led many military and political leaders worldwide to value the significance of influence and control over the information environment. Moreover, the widely accepted understanding is that this influence and control can go beyond its traditional force multiplier role in conventional military operations and become central in non-military confrontation.

In the United States, the Department of Defense defines information operations as disruptive actions aimed at the decision-making process of potential adversaries. These actions include employing information-related capabilities (IRC) to gain advantages in the information environment's three distinct dimensions: physical, informational, and cognitive.[45] JP 3-13 further specifies that the IRCs affect the ability of the targeted individual or group "to collect, process, or disseminate information before and after decisions are made."[46] Beyond the offensive aspect, information operations incorporate defensive actions as well. By employing IRC, the information operations aim to protect their own forces in the three-dimensional information environment from hostile activities that can undermine their own chain of command and the decision-making process. Thus, in its essence, an information operation seeks to change the adversary's situational awareness and diminish its information capabilities, in order to ultimately disrupt the adversary's decision-making process.

The Russian political elite, the military, and the academic community attach equally high importance to the process of influence and confrontation in the information environment. As the Chief of General Staff of the Russian Armed Forces, General Valery Gerasimov, points out that information warfare creates wide asymmetric opportunities to

[45] The Joint Chiefs of Staff, *JP 3-13*, 3.

[46] The Joint Chiefs of Staff, I–3.

Page 2873 of 3957

reduce the enemy's combat potential.[47] In Russian documents on the topic, these activities are part of the broader concept of information warfare (*informacionnoe protivoborstva, Russ. информационное противоборство*). Igor Panarin postulates that the main goals of information warfare are to undermine the information security of the hostile state; to damage the integrity (stability) of its governmental and military control system; and to effectively influence the information provided to its leadership, political elite, and the systems that form the public's opinion, perception, and decision making. Panarin states that the ultimate goal of every state in information warfare is to achieve information superiority in the world information environment. Although he does not define the distinct dimensions of the information environment, he distinguishes two types of information warfare—technical and psychological. The first refers to the situation in which the targeted systems exchange and process information, and the latter focuses on the political elite's and public's cognitive capabilities and the alteration of public opinion. However, this differentiation demonstrates that the Russian concept also recognizes that information warfare can target different dimensions—physical or cognitive.[48]

The Ministry of Defense of the Russian Federation shares this definition. It specifies that, in wartime, information resources and capabilities become specific means to suppress enemy activity and deprive it of the opportunity to resist.[49] The Russian military leadership also recognizes the multidimensional character of information warfare. It can have both physical and informational-psychological impacts on the adversary's force. The former is the destruction of the enemy's information, radio-electronic, and computer networks, and the latter is the psychological influence on the population and the personnel of the armed forces of the opposing sides. The Russian concept incorporates both defensive and offensive aspects that must be considered in their unity. As both Panarin and the

military experts underline, it is equally important to protect one's own decision-making process and to influence the adversary's command and control system in information warfare.

The contemporary Russian information warfare concept uses and adapts the Soviet Union's "active measures" such as *dezinformatsiya* or the intentional spread of disinformation or false, inaccurate, and controversial information to mislead the target audience and shape adversaries' public opinion.[50] Arif et al. point out that such strategies are "ideologically fluid," and thus they are suitable to sow discord among very diverse political groups. They involve "harnessing existing public discontent by amplifying reductive social interpretations that confirm existing beliefs, support desired conclusions, or prompt certain strong emotions regarding groups of people and events."[51]

Beijing has carefully analyzed the campaigns of the United States in the Gulf War, Kosovo, Iraq, Afghanistan, and Ukraine, and what role information operations played in them.[52] It uses these lessons learned to adjust and update its concept for information warfare. The foundation of modern Beijing's concept are the theories of "Unrestricted War" and the "Three Warfares." The former posits that, in future conflict, the state has to implement "all means, including armed force or non-armed force, military and non-military, and lethal and non-lethal means to compel the enemy to accept one's interests."[53] The latter is part of so-called "political warfare," which includes the integrated usage of psychological warfare, public opinion warfare, and legal warfare. These three warfare types constitute "a discursive power over an adversary—that is, the power to control

Page 2875 of 3957

perceptions and shape narratives that advance Chinese interests and undermine those of an opponent."[54]

Beauchamp-Mustafaga and Chase explain that public opinion warfare includes using "various media means and information resources" to "create a favorable public opinion environment for political initiative and military victory.[55]" This type of warfare has a relatively permanent nature and occurs both in wartime and peacetime. It finds expression in "long-term infiltration into the objects of the society and culture's deep structure, changing the awareness and conviction of the enemy masses."[56] Charon et al. specify that China's general idea of public opinion refers to the terms "public emotion" and "public opinion." The first term is "subjective interpretation of certain social realities,"[57] and therefore, it is an individual's perception. At the same time, the second emphasizes "the socio-political attitudes generated by social interactions, and thus it is the collective majority opinion."[58] Hence, control over public opinion is inextricably tied with control over public emotions. Charon and Jeangène Vilmer describe the core of public opinion warfare as the "cognitive orientation of the masses, to excite their emotions and to constrain their behavior."[59]

Beauchamp-Mustafaga and Chase point out that there is a difference between public opinion warfare and psychological warfare. The latter is "more focused and concentrated in wartime."[60] According to their analysis of strategic documents of the People's Liberation Army, Charon and Jeangène Vilmer assert that Beijing distinguishes four types of psychological warfare: "coercion," "mystification," "division," and "defense."[61] The first seeks to force the adversary to adopt a particular behavior; the

[60] Beauchamp-Mustafaga and Chase, *Borrowing a Boat Out to Sea*, 8–9.

[61] Charon and Jeangène Vilmer, *Chinese Influence Operations*, 49–50.

second spreads confusion and misleads; the third uses the adversary's weaknesses and domestic disagreements to hinder its decision-making process, ruin fighters' morale, and diminish public confidence. The fourth protects one's own troops' morale from the enemy's influence.[62] Related to psychological warfare is the concept for "cognitive domain operations." As Beauchamp-Mustafaga and Chase explain, China considers these operations as the next step in the evolution of warfare, "moving from the natural and material domains—land, maritime, air, even electromagnetic—into the ephemeral, namely the human mind."[63] Such operations target the enemy's cognitive thinking and decision-making processes with the means of psychological warfare to disrupt. Their ultimate goal is to achieve "mind superiority."[64]

The third component of the "Three Warfares" concept, legal warfare, corresponds to the strategic use of the law. Its essence is to exploit the legal provisions of international and national laws to provide legitimacy for Chinese demands or policies.[65] Its goal is to "attain normative superiority" that can justify the use of force during a conflict, or when confrontation ends "to retain any gains or to claim its due."[66]

The "Three Warfares" concept demonstrates that China, like the United States and Russia, also sees information warfare as a multidimensional phenomenon and recognizes the importance of operations in the information and cognitive dimensions. Beijing combines contemporary theories such as cognitive-domain operations, discursive power, and political warfare with older concepts such as "active measures," which China inherited from its historical ties with the former Soviet Union. This combination, together with the lessons learned from its main allies and adversaries, allows China to adapt its strategies and doctrines successfully to exploit the benefits and weaknesses of today's information environment.

[64] Charon and Jeangène Vilmer, *Chinese Influence Operations*, 31.

[65] Charon and Jeangène Vilmer, 31.

[66] Charon and Jeangène Vilmer, 51.

In conclusion, all three major actors in the international political system adopt strategies and develop capabilities to gain an advantage over the information environment. As described in the literature just reviewed, the ultimate goals of information operations are to hinder the decision-making process of the adversary's political leadership and military commanders, affect the morale of the population and armed forces of the hostile nation, and protect a country's own forces and political system from malicious influence. Thus, information operations have both defensive and offensive aspects.

A common understanding is that the information environment has different dimensions that define two specific directions of confrontation. The first targets the physical dimension and the technical systems that transmit, receive, and store information; the second aims at psychological impacts on the target audience by manipulating the information and cognitive dimensions. In recent years, with the increase in online connectivity and rapid expansion of social media such as Facebook, Instagram, and Twitter, the latter dimension has grown more significant.

B. SOCIAL MEDIA IN INFORMATION WARFARE

This section explores the main characteristics of the information operations conducted on social media, and on Twitter in particular, by the adversaries of the United States and NATO. Although the previous chapter makes clear that China has significant capabilities and ambitions to dominate the global information environment, until recently, Beijing's focus has been predominantly on influencing its close neighborhood (Hong Kong, Taiwan), the Pacific region, and North America. This thesis, however, focuses primarily on the activities of various entities connected to the Russian Federation as they relate to the possible effects of hostile information operations conducted during NATO exercises in Europe. Samantha Bradshaw and Philip Howard point out that the social media information environment is complex and constantly evolving. In this environment, various actors pursue their political goals by creating and disseminating narratives designed to provoke a specific reaction in the targeted audience. At the same time, these audiences also are a diverse community, and they react differently to these narratives. Often, they

Page 2878 of 3957

contribute to the further development of the narrative by adding links to other content such as video, pictures, or music.[67]

Various Russian companies and organizations are involved in social media information operations. Some of them operate openly, such as the television channel RT (formerly Russia Today) and the news agency Sputnik, while others work covertly, such as the IRA. This combination allows the Kremlin to run "large-scale and complex information operations" with actors "at varying levels of attribution."[68]

The overt companies comprise a vast network that connects to domestic and foreign audiences through online channels on different social media platforms and at the same time creates more traditional content for TV channels, newspapers, and news agencies. These two forms of communication cannot be entirely separated because the traditional media products are also disseminated online.[69] A 2021 report by the NATO Center of Excellence for Strategic Communication reveals that the RT news service is central in Moscow's information operations. This news service was created in 2005 under Russia Today's brand, but later it changed its name to RT. The non-profit organization ТВ-Новости/TV-News controls RT; however, RT's funding comes entirely from the Russian state budget. In 2020, the subsidy to TV-News was more than 360 million U.S. dollars. Around 83% of these funds are dedicated to media content production. Margarita Simonyan has been in charge of the main editorial office of RT since 2005.[70] She and her husband have tight connections to members of the presidential administration, such as its First Deputy Chief of Staff, Alexei Gromov. He is one of RT's creators and maintains the Kremlin's control over the work of the largest newspapers, television channels, and news agencies.[71] RT also has a YouTube channel, which was the first "to reach 1 billion views … and later it was

also the first to reach 10 billion views."[72] In addition, RT has a vast network of Twitter accounts in different languages, such as @RT_COM, @RT_America, @RTUKnews, @de_rt_com, and @RTarabic_Bn. Each of these accounts has between several thousand and several million followers. Simonyan herself has 531.7 thousand Twitter followers. In a congressional hearing, one Twitter official testified that "@RT_COM and @RT_America together spent $516,900 in advertising in 2016. As a result, they were able to promote 1,912 Tweets and generate approximately 192 million impressions[73] across all ad campaigns.[74]

Another Russian media group with significant input into information operations is Rossiya Segodnya. It is state-owned, and in 2020 the company received 100 million U.S. dollars from the state budget.[75] Rossiya Segodnya is a holding company that controls influential media outlets such as RIA Novosti, Sputnik, InoSMI, Baltnews, and others. These news agencies publish their information products on various online platforms, including Twitter.

Russia's network of existing official media channels significantly contributes to Moscow's capability to organize and conduct information operations. Its main contributions are to receive legally directed funds from the Russian state for media production and to operate legally in different countries. In addition to creating content in several different languages, this arrangement helps such media outlets to access broad audiences. As Hanley and Kuzichkin point out, RT and Sputnik use this opportunity and customize their media products "depending on the audience and the strategic objective."[76] The authors explain that for its Latin American audience RT produces leftist content in the

Page 2880 of 3957

Spanish language, while its products for Eastern European countries emphasize national or historical ties to Russia or praise the strength of the Russian economy.[77]

Complementing these public media organizations, the Kremlin's information operations arsenal has companies that use covert methods, including fake accounts and divisive and fake information posting. A notorious example is the Internet Research Agency, a Russian corporation based in Saint Petersburg. Various authorities and scientists have revealed the corporation's interference in the 2016 U.S. Presidential election[78] and the Black Lives Matter movement's protests.[79] According to Howard et al., the IRA has been using Twitter since 2009. The initial focus was on the Russian audience, and the tweets were primarily in the Russian language. The company began targeting English-speaking users at a slow pace in 2013. By the beginning of 2014, however, its engagement with English-speaking users had increased and grew significantly by the end of the year.[80]

Although the company had direct links to the Russian government, the IRA primarily received funding for its operations from two companies, Concord Management and Consulting and Concord Catering. Both were under the control of Nikolay Prigozhin,[81] who is also the owner of Wagner (a private military company) and has close connections to the Kremlin elite.[82] The IRA's activities also received funding as part of a large interference operation named "Project Lakhta" that targeted audiences in the United States and Russia, France, and other countries. As of 2016, the IRA's monthly budget was over 1.25 million U.S. dollars.[83]

[83] *The U.S. vs. the Internet Research Agency* at 7.

The IRA's organizational structure was complex, and it had hundreds of employees "ranging from creators of fictitious personas to technical and administrative support."[84] The company had management and specialized graphic design, data analysis, search engine optimization, finance, information technology, and translation departments. The latter allowed its operators to post information on social media in different languages and expand its global reach.[85] The IRA's staff members worked two 12-hour shifts to match regular users' activity in different time zones, as they did during the 2016 U.S. presidential election. Their tasks were "to create social media accounts that appeared to be operated by U.S. persons…[and]… create political intensity through supporting radical groups, users dissatisfied with [the] social and economic situation and oppositional social movements."[86] The employees were very productive: they created 36,746 accounts related to the 2016 presidential election. They posted approximately 1.4 million election-related tweets from September through November 2016, and these tweets received approximately 288 million impressions.[87] The IRA's management was responsible for receiving and evaluating the impact of the organization's online social media operations and the size of the online U.S. audiences reached through IRA's posts. They measured "different types of engagement with the posts (such as likes, comments, and reposts), changes in audience size, and other metrics."[88]

These Russian organizations, both the overt and covert ones, involved in information operations have the capability to engage global audiences on various social media platforms and in different geographical locations. Online, such organizations operate on Twitter, Facebook, Instagram, and geographically, they can influence audiences both far and near their borders.[89] However, these targeted social groups in the 'far abroad' and

Page 2882 of 3957

'near abroad' have different characteristics, forcing the Kremlin to adapt its influence strategies.

The so-called 'near abroad' includes the former Soviet republics and most East European states. Such countries usually have sizable Russian minorities, Russian-speaking citizens, or groups that share common memories or interpretations of history. These communities are both targets and conduits of Russian "soft power" and influence.[90] Moscow's most important narratives in these countries include tropes about traditional (Russian) conservative values, such as family and orthodoxy, a shared fear of violent revolutions, and the West's betrayal and moral degradation.[91]

In contrast to the 'near abroad,' Russian information operations in the 'far abroad' countries focus on radical political groups, social movements, and religious groups. Andrew Weisburd, Clint Watts, and Jim Berger argue that Moscow's information campaigns fall into four categories: political, financial, social, and conspiracy. The political and financial campaigns aim to slander political leaders, undermine governmental institutions' credibility, or erode trust in the financial system or experts. The social objectives of such operations seek to "undermine the fabric of society."[92] Finally, the dissemination of conspiracy theories promotes images of "global calamity while questioning the expertise of anyone who might calm those fears."[93]

Ben Nimmo formulates four specific tactics that the Kremlin uses to achieve these goals: dismiss, distort, dismay, and distract. The dismiss tactics deny the truth of the facts that contradict Moscow's narratives or tarnish the credibility of the source of these facts. The distorted tactics mix cherry-picked facts, lies, and disinformation. Since the ultimate goal is to sow doubts in the designated audiences, the truthfulness of the dismissed facts or blatant falsehood of the distorted message is not essential. All these tactics need only to

[93] Weisburd, Watts, and Berger.

Page 2883 of 3957

disorient the targeted population or social groups. The dismay tactics intimidate and induce fear and anxieties in the audience, usually through harassment and personal threats. Finally, the distraction techniques turn the "attention away from the activities of Russia and its allies by launching accusations elsewhere."[94] Overall, as Peter Pomerantsev and Michael Weiss observe, "the aim of this new propaganda is not to convince or persuade, but to keep the viewer hooked and distracted, passive and paranoid, rather than agitated to action."[95]

Linvill and Warren explored the implementation of these tactics by the IRA from June 19, 2015, to December 31, 2017, and "identified five categories of IRA-associated Twitter handles, each with unique patterns of behaviors."[96] These categories are Right Troll, Left Troll, News Feed, Hashtag Gamer, and Fearmonger. The Right Troll accounts posted nativist and right-leaning populist messages. The Left Troll handles published "socially liberal messages, with an overwhelming focus on cultural identity."[97] The News Feed accounts "overwhelming presented themselves as the U.S. local news aggregators,"[98] while the Hashtag Gamer handles promoted hashtag games, some of which had socially or politically divisive hashtags. The fifth category, Fearmonger trolls, posted news about crisis events, usually fabricated. The authors observed that Left and Right Trolls were more active than the other types, but their activity varied significantly on a day-to-day basis. The News Feed accounts tweeted at a relatively consistent rate throughout the explored period. By contrast, the Hashtag Gamer handles were "very active during and after the election season, but by the summer of 2017, they [were] nearly silent."[99] All five troll types changed their behavior under specific political circumstances. For example, when John Podesta's email was leaked to the press for the first time (8:30 pm UTC on October 7,

2016), the News Feeds trolls continued to post messages at their regular low rate. Meanwhile, the Hashtag Gamers' activity which was very high in the late hours of October 5, 2016, went silent in the following days. In contrast, the Left and Right trolls became active on October 6, 2016, and tweeted at a high rate until October 7, 2016.[100]

In conclusion, the Russian Federation has the capability to organize and implement online information operations through its covert and overt assets. RT news network and Sputnik news agency are among the most powerful tools in the Russian online arsenal. Under the Kremlin's strict control, they deliver and popularize narratives to their vast audience in countries in the near and the far abroad. Additionally, Moscow has created companies that use covert techniques to engage carefully selected social groups in order to manipulate their perceptions and emotions. In such cases, the main goal is to sow distrust, disorient targeted groups' value systems, and amplify social divisions. An example of this type of covert organization is the Internet Research Agency, which had hundreds of employees, and its leadership had close connections to the Kremlin's political elite. Studies of the IRA's activities and tactics revealed possible patterns in its operations on Twitter. Most importantly, research has delineated the types of accounts that IRA operators used for their tasks. These accounts revealed distinct posting behaviors and shared specific information.

Russia's overt and covert organizations have developed a global reach and can target audiences in various languages. Typically, in the 'near abroad' countries, the target is local Russian-speaking communities, Russian ethnic minorities, and other groups that share cultural, historical, or religious identity with Russia. For these audiences, Moscow's narratives include positive interpretations of the Russian political and cultural model and negative depictions of the Western political, financial, and social systems. The 'far abroad' narratives aim at damaging social cohesiveness and confidence in institutions. Since their goal is to reinforce the most radical opposing opinions, they may also include positive and negative messages regarding a particular topic.

Page 2885 of 3957

The next chapter details the research methods used in this thesis to examine user activity on one particular social media platform, Twitter, between July 2013 and August 2014, to identify factors related to IRA and Russian media efforts specifically influencing sentiments in tweets about NATO.

Page 2886 of 3957

IV. RESEARCH METHODS

A. HYPOTHESES

This research examines one year of user activity on Twitter from July 2013 to August 2014. The purpose is to identify the significant factors that influence sentiments related to tweets on a particular topic—in this case, all tweets in which the text included the acronym NATO.

The first hypothesis is that the overall sentiment in the online conversation on NATO will become more negative if there is an increase in IRA and Russian media activity (Hypothesis 1). The second hypothesis is that while NATO exercises are occurring the sentiment of the online conversation related to NATO will become more negative as the activity of Russian media organizations, whether covert or overt, increases. Third, this thesis hypothesizes that the change in sentiment during NATO exercises will be more negative in a country closer to the borders of the Russian Federation (Hypothesis 3). Fourth, this thesis also hypothesizes that IRA and Russian media activity during NATO exercises will increase the size of the daily user network for the NATO conversation, and that network will become more centralized and interconnected (Hypothesis 4).

B. DATA AND METHODS

To test the hypotheses formulated in Section A this thesis examines specific datasets and applies different methods, such as regression and sentiment analysis, text mining, and social network analysis.

1. Datasets

This thesis uses the NPS-licensed Twitter archive as the primary data source. It contains a random sample of ten percent of the tweets posted globally between August 1, 2013, and July 31, 2014.

A search query was constructed based on the acronym NATO (in the English, French, Chinese, and Cyrillic alphabets) and a list of handles connected to IRA and Russian online media outlets. The U.S. House of Representatives Permanent Select Committee on

Page 2887 of 3957

Intelligence published these handles in June 2018.[101] The query's results are stored in two datasets. In the first, the results are aggregated in "country-date" units. In the second dataset, each row represents a separate tweet with its text, and each message is represented as a "point" at a latitude/longitude/time location.

2. Sentiment Analysis and Text Processing of Social Media Data

Social media sentiment analysis relies on dictionaries containing words with predetermined positive or negative sentiment scores. In this research, two separate sentiment lexicons[102] are used, one with negative words and one with positive words. These dictionaries are in the English language; therefore, the text of every tweet needs translation before further processing.

Since this research dataset contains information about the tweet's language, the initial dataset was split into smaller sub-datasets according to the tweet's language. The result was 45 distinct sub-datasets organized by "tweet ID" and "text." These sub-datasets were translated using the Google Translate website at the next stage. After translation, each tweet's text went through text processing, including tokenization and cleaning of redundant symbols and words such as punctuation signs, special characters, or symbol combinations (e.g., @, RT, and URLs).

Next, cleaned tokens (words) were compared to the content of the positive and negative dictionaries. Depending on which lexicon contained a match for a word, each word received a sentiment score accordingly. Each word's score was calculated with Formula 1 to distinguish between a positive and a negative sentiment:

$$S_{word} = Positive\ score - Negative\ score \quad (1)$$

Words with a positive sentiment were coded as 1, and the negative as -1. If there was no match or the word was found in both dictionaries, the sentiment score was 0 or neutral.

---

101 *The Internet Research Agency's Handles as of June 2018*, U.S. House of Representatives Permanent Select Committee on Intelligence (Washington, DC, 2018), https://intelligence.house.gov/uploadedfiles/ira_handles_june_2018.pdf.

102 Minqing Hu and Bing Liu, *Mining and Summarizing Customer Reviews*, Research Track Paper (Chicago, IL: University of Illinois at Chicago, 2004).

Page 2888 of 3957

Finally, the overall sentiment of the tweet was calculated using Formula 2 as the sum of the sentiment scores of its tokens:

$$S_{tweet} = \sum_{i=1}^{n} S_{word_i} \quad (2)$$

3. Network Topography Measures

After the sentiment score of the tweets was calculated, edge lists were created for every day in the research period. Two Twitter accounts have a tie between them if one of them retweeted, mentioned, or quoted the other's tweet. The attribute list includes username, language, followers, country name, date when the user tweeted, and two flags indicating whether the user was an IRA member or a Russian official media outlet. Using R-package "igraph,"[103] it was possible to calculate the network size, density, local clustering coefficient, and degree centralization score for all users in 365 social networks.

4. Dependent Variables

The mean sentiment of the tweets in the NATO conversation (as defined earlier) was the dependent variable used to test Hypotheses 1 through 3. It is aggregated to a "country-date" unit of analysis. It is an ordered categorical variable with three levels. The first corresponds to negative sentiment, the second to neutral sentiment, and the third to positive sentiment.

Other dependent variables based on network structure, such as network size, local clustering coefficient, and degree centralization, were used to test Hypothesis 4. The network size is based on the number of accounts in the network. It provides information on how many users participated in the explored NATO online conversation. The change in network size during the research period can provide information on how the network of participants was growing or shrinking.[104] The local clustering coefficient is an interconnectedness measure known as average ego-network density. It provides

[104] Daniel Cunningham, *Understanding Dark Networks: A Strategic Framework for the Use of Social Network Analysis* (Lanham, MD: Rowman & Littlefield, 2016), 86.

Page 2889 of 3957

information on how interconnected the actors of the ego network are.[105] The degree centralization score "uses the variation of the actor's [degree] centrality within the network to measure the level of centralization."[106] If the degree centralization is high, the users' degree centrality scores significantly vary. Therefore, if the score is high, one or a few accounts are significantly more active than the others.[107]

5. Independent Variables

The independent variables cover five categories: spatial effects, network topography, levels of online activity, and the dates of NATO and Russian military exercises.

The distance to the Russian border is the only spatial variable. It represents the shortest distance between the Russian state border and every tweet's location, measuring 0 for tweets originating inside Russia.

Edge density, the only social network topography measure, is an independent variable in the models that test Hypotheses 1 through 3. It introduces information about the behavior of daily user accounts into the model. Its change reflects the emergence or disappearance of the network's ties (as defined earlier).

The Twitter-related variables count the number of tweets originating from IRA or Russian overt accounts by day.

Finally, the exercise-related variables provide information measuring the dates on which NATO or Russian military exercises occurred, coded as 1 for the dates of the exercises and 0 for all other dates. Jan Brzezinski and Nicholas Varangis summarized NATO and Russian military activity over this period, and provided information about their timeline, location, and participants.[108] There were four NATO military drills in Eastern

Page 2890 of 3957

Europe and Scandinavia in the research period. "Steadfast Jazz" took place in Poland and Lithuania (November 2–9, 2013), Norway hosted "Cold Response" (March 7–21, 2014), Estonia hosted "Spring Storm 14/Steadfast Javelin I" (May 5–23, 2014), and "Saber Strike 2014" took place in the Baltic States (June 9–20, 2014). The Russian Federation had three large-scale exercises in the research period. They took place in the Western Military District (Zapad-13, September 17–26, 2013), in the Western and Central Military Districts (February 26–March 3, 2014), and the Central Military District (June 21–28, 2014).

6. Control Variables

The control variables in the tested model are the total number of tweets, the country's population, gross domestic product per capita, political regime type, and access to the internet.

Gross domestic product (GDP) per capita and population provide information about the relative size and prosperity of each country. Access to the Internet provides information about the degree to which the population can use online media as a source of information. The World Bank Development Indicators[109] are the source of these three variables.

The political regime variable is derived from the Polity5 Project dataset.[110] The model uses the revised combined polity score (Polity2), adapted for time-series analysis. It ranges from 10 (strongly democratic) to -10 (strongly autocratic). Introducing this variable in the model provides an opportunity to examine how the ruling regime or the type of government influences the effectiveness of online information operations.

The total number of tweets variable provide information about the overall daily activity in Twitter

[109] World Bank, "World Development Indicator," accessed February 27, 2022, https://datatopics.worldbank.org/world-development-indicators/.

C. REGRESSION ANALYSIS

The initial analysis presented here utilizes ordered logit regression models. Its goal is to test the formulated hypotheses concerning the relationship among online sentiments, military exercises, and the activity of Russian overt and covert agents. The regression analysis tests four different models. It starts with a simple additive form and gradually introduces different multiplicative interaction terms. These terms examine different relations among the independent variables in accordance with the formulated Hypotheses 1 to 3. A log transformation is applied to all independent variables in the model except *NATO Exercise*, *Russian Exercise*, and *Political Regime* in order to reduce the skew in their values. The full version of the sentiment model is as follows:

$$
\begin{aligned}
\text{Sentiment} = \; & \beta_0 + \beta_1 \text{NATO Exercise} + \beta_2 \text{Russian Exercise} + \beta_3 \text{IRA Tweets} \\
& + \beta_4 \text{Distance to Russia} + \beta_5 \text{Russian Media Tweets} + \beta_6 \text{Edge Density} \\
& + \beta_7 \text{Political Regime} + \beta_8 \text{GDP} + \beta_9 \text{Population} \\
& + \beta_{10} \text{Access to Internet} + \beta_{11} \text{Total Tweets} \\
& + \beta_{12} (\text{Russian Exercise} * \text{Distance to Russia}) + \beta_{13} (\text{NATO Exercise} * \text{Distance to Russia}) \\
& + \beta_{14} (\text{Russian Exercise} * \text{IRA Tweets}) + \beta_{15} (\text{NATO Exercise} * \text{IRA Tweets}) \\
& + \beta_{16} (\text{Political Regime} * \text{IRA Tweets}) + \beta_{17} (\text{NATO Exercise} * \text{Russian Media Tweets})
\end{aligned}
$$

In addition, six log-linear models are used to test Hypothesis 4. Each pair of models tests a different dependent variable—network size, degree centralization, or clustering coefficient—with the first model providing a baseline additive specification and the second model including multiplicative interaction terms. The full version of each model is given by:

$$
\begin{aligned}
\text{Network Metric} = \; & \beta_0 + \beta_1 \text{IRA Tweets} + \beta_2 \text{Russian Media Tweets} + \beta_3 \text{Distance to Russia} + \beta_4 \text{NATO Exercise} \\
& + \beta_5 \text{Political Regime} + \beta_6 \text{GDP} + \beta_7 \text{Population} + \beta_8 \text{Access to Internet} + \beta_9 \text{Total Tweets} \\
& + \beta_{10} (\text{NATO Exercise} * \text{IRA Tweets}) \\
& + \beta_{11} (\text{NATO Exercise} * \text{Russian Media Tweets}) \\
& + \beta 2 (\text{Political Regime} * \text{IRA Tweets})
\end{aligned}
$$

Page 2892 of 3957

V. REGRESSION RESULTS

A. RUSSIAN ONLINE INFLUENCE ON SOCIAL MEDIA SENTIMENT

1. Findings

Tables 1, 2, and 3 show the results of four ordered logit models and their performance. The first table includes the goodness of fit scores for the different models, the second presents the base term coefficients, and the third shows the multiplicative interactive terms in the tested regression models. The analysis of models' goodness of fit scores reveals that the models achieve similar overall error rates, shown by the mean absolute error (MAE) and the root mean squared error (RMSE), while Model 4 performs slightly better than the others according to the Akaike's Information Criteria (AIC) scores. Thus, Model 4 is used for further analysis.

Table 1. Sentiment Regression Models: Goodness of Fit

	Sentiment			
	Model 1	Model 2	Model 3	Model 4
	(1)	(2)	(3)	(4)
Observations	57,377	57,377	57,377	57,377
MAE	0.222	0.222	0.222	0.222
RMSE	0.341	0.341	0.341	0.341
AIC	51,658	51,634	51,618	51,617
BIC	51,774	51,769	51,771	51,787
Log Likelihood	-25,816.011	-25,802.100	-25,792.176	-25,789.443

The results in Table 2 show that there is a positive (0.065) statistically significant relationship ($p < 0.01$) between the number of IRA tweets and the average sentiment of the NATO conversation. Russia's overt media activities also have positive relationship (0.051) to sentiment of the tweets across country-day, though with a lower level of statistical significance ($p < 0.05$). The edge density of the network of users is the third coefficient that is also positively related to sentiment of the tweets. Finally, the control variables are

Page 2893 of 3957

statistically significant, although on a different level. All of them have a p-value<0.01, except political regime with a p-value<0.1. All their coefficients except the country's access to the internet are negative.

Table 2. Sentiment Regression Models: Base Terms

Note:				*p<0.1; **p<0.05; ***p<0.01

Page 2894 of 3957

Table 3 provides information about the multiplicative interaction terms included in Models 2, 3, and 4. The first two terms test Hypothesis 2, or whether there is a negative effect on sentiment arising from the combination of NATO exercises and the activity of Russia's overt and covert media actors. The first interaction term between *NATO Exercise* and *IRA Tweets* is negative (-0.106) and statistically significant ($p < 0.01$). The second term, which reflects the influence of Russia's overt media outlets on sentiment during NATO exercises, is not statistically significant. Therefore, it is impossible to draw firm conclusions concerning the direction and the strength of the relationship. The third term, which represents how the users' distance from the Russian border influences the sentiment of their tweets when a NATO exercise occurs, is positive and statistically significant, indicating that sentiment is stronger at longer distances. The fourth and fifth terms test the effects of *IRA Tweets* and *Distance to Russia* on sentiment during Russian military exercises rather than NATO exercises. Of these, only the interaction between *Distance to Russia* and *Russian Exercise* is statistically significant ($p < 0.01$), with a negative (-0.054) coefficient, implying that Russian exercises generate more negative effects on sentiment as the distance from Russia grows. Finally, the sixth term tests how IRA activities and the country's political regime type generate combined effects on sentiment. It is negative (-0.003) and statistically significant, although to a lesser degree ($p < 0.1$), implying that IRA activities generate more negative impacts on sentiments in democracies than in autocracies.

Page 2895 of 3957

Table 3. Sentiment Regression Models: Multiplicative Interaction Terms

2. Analysis of the Findings

Hypothesis 1: *The overall sentiment of the NATO online conversation will become more negative if there is an increase in IRA and Russian media activity.*

The results from the regression models do not support Hypothesis 1. Figure 1, showing estimates derived from Model 4, demonstrates that increased IRA activity heightens the probability that the average sentiment will be positive (blue line) and lowers the probability for negative sentiment (red line) in the graph at the left. The second graph on the right shows that the that the tweets by overt Russian media have a similar effect on sentiment, though that effect is slightly weaker.

Page 2896 of 3957

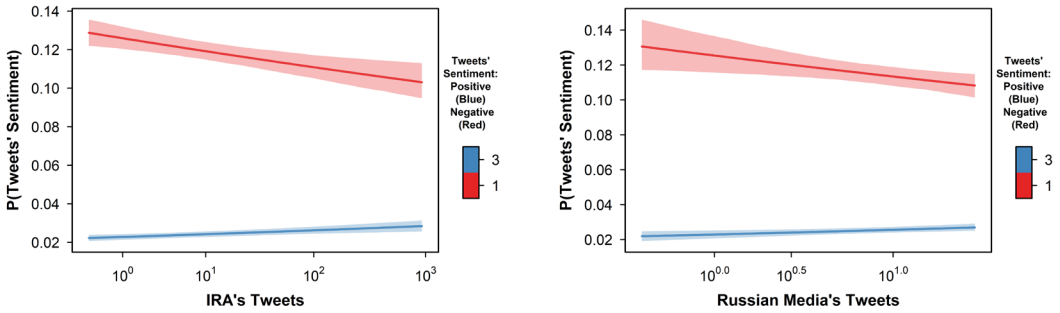

Figure 1. IRA and Russian Media Tweets vs. Sentiment in the NATO Conversation

The colored shading around the lines in the graphs shown in Figure 1 represent the 95% confidence interval of the respective variables and to what degree the slope of the lines in the graphs can vary within this interval. The comparison of the two graphs in Figure 1 reveals that the slopes of the lines are different. Both lines in the graph at left, depicting the IRA's tweets, have a steeper slope than those in the graph at right, depicting the effects of tweets by overt Russian media, which means that the IRA's activity has a more substantial effect on the sentiment than does the activity of overt Russian media.

Figure 2 further supports this conclusion by presenting the substantive effects of IRA and Russian media tweets on positive or negative sentiment probability. For convenience and better comparison, the graphic on the right in Figure 2 presents the absolute values of these effects. From Figure 2, it is easy to compare of the effect magnitudes, which are, in fact, negative (given the red lines on the graphs in Figure 1 have negative slopes).

Page 2897 of 3957

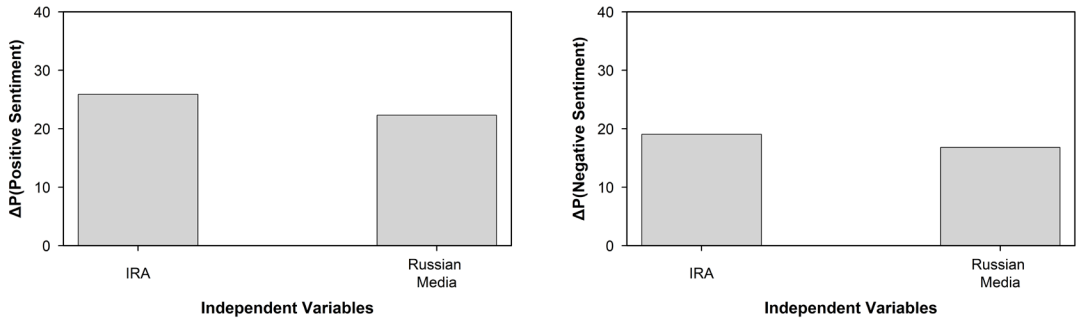

Figure 2. Substantive Effects of IRA and Russian Media Tweets on the Probability of Positive and Negative Sentiment

The graphics in Figure 2 demonstrate two important findings. First, the IRA's tweets have a stronger impact on the probability of sentiment change than tweets by the overt Russian media. Second, both the overt and the covert Russian actors more effectively generate positive sentiment and are counter-intuitively associated with decreases in negative sentiment.

Hypothesis 2: *The sentiment of the online NATO conversation during NATO exercises will become more negative with the increase of the activity of Russian media organizations, whether covert or overt.*

The regression models provide evidence that is partially supportive of Hypothesis 2. The first and second interaction terms in Table 3 provide the necessary information to examine how the Twitter activity of Russia's covert and overt media organizations affects the online conversation about NATO during NATO exercises. The first term *NATO Exercises*IRA Tweets* is statistically significant ($p < 0.01$) and negative (-0.106), implying that IRA activities generate more negative effects during NATO exercises. Figure 3 demonstrates this effect graphically. When NATO exercises take place, the increase in IRA's online activity results in a decreased probability for positive sentiment among network users. Conversely, when there is no NATO exercise, the probability for positive sentiment about NATO among network users increases when the number of the IRA tweets increases.

Page 2898 of 3957

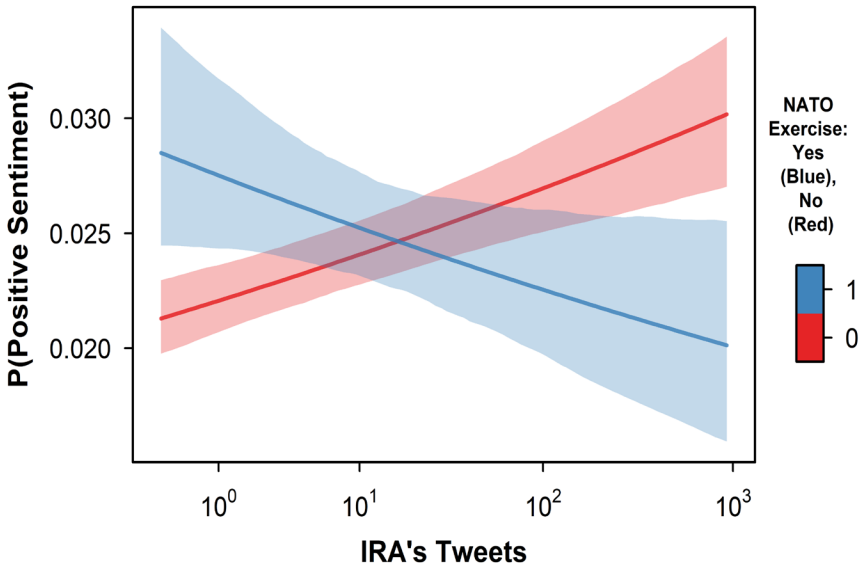

Figure 3. NATO Exercises and IRA Tweets vs. Probability of Positive Sentiment

In contrast, the term *NATO Exercise*Russian Media Tweets* is not statistically significant. This finding suggests that in the researched period, during NATO exercises, the Twitter accounts of overt Russian media probably were not as active in the online NATO conversation. This is contrary to the prediction of Hypothesis #2, which expected both overt and covert Russian media to have similarly negative effects during NATO exercises.

Hypothesis 3 *The change of sentiment during NATO exercises will be more negative if the country is closer to the borders of the Russian Federation.*

The regression results support this hypothesis. The multiplicative interaction term *NATO Exercise*Distance to Russia* is statistically significant ($p < 0.01$) and positive (0.027). Figure 4 shows that when NATO exercises take place, the probability that the average sentiment in the online conversation about NATO will be positive is lower in countries that are closer to the borders of Russia. In contrast, when there is no NATO exercise, the likelihood for positive sentiment decreases in countries that are further from Russia.

Page 2899 of 3957

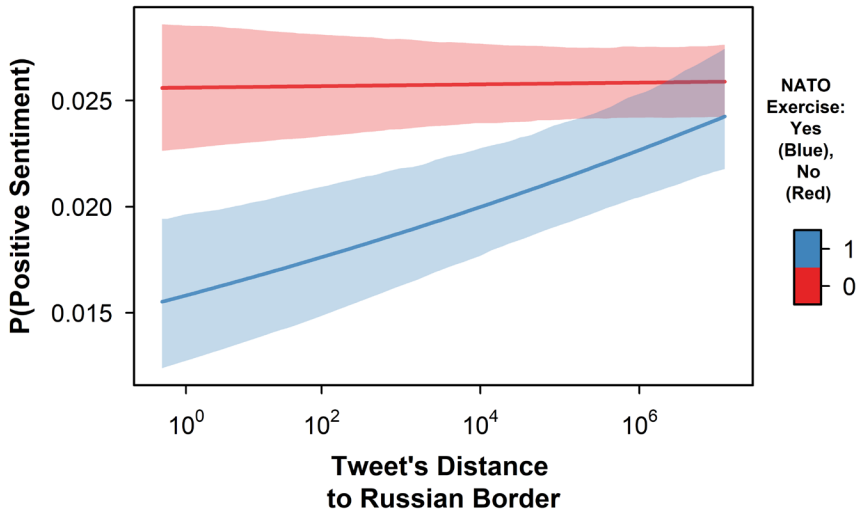

Figure 4. NATO Exercises and Distance to Russia vs. Probability of Positive Sentiment

B. NETWORK MEASURES AND RUSSIAN ONLINE INFLUENCE

Based on the models' performance scores in Table 4, it is possible to conclude that models 6, 8, and 10 have the best goodness of fit. They each have lower AIC and Bayesian Information Criteria (BIC) scores than the other three paired models presented in the table, indicating that the addition of the interaction terms decreases the models' errors.

The IRA and Russian media coefficients are statistically significant ($p < 0.01$) for all three topology measures. Those for clustering coefficient and network size are positive, for both overt and covert media activity, suggesting that these Russian entities' actions make the daily networks larger and more interconnected. The degree centralization coefficient for IRA activities is also statistically significant ($p < 0.01$). However, it is negative, which indicates that the daily network becomes less centralized with the increasing activity of Russia's covert media organizations.

The interaction term *NATO Exercise*IRA Tweets* is statistically significant ($p < 0.01$) for all three models. It is negative in the models for network size (-0.143) and clustering (-0.064), and it is positive in the case of degree centralization (0.027). The term

Page 2900 of 3957

*NATO Exercise*Russian Media Tweets* is statistically significant and positive only in the degree centralization ($p < 0.05$) and clustering ($p < 0.01$) models.

Page 2901 of 3957

1. Analysis of the Findings

Hypothesis 4: *IRA and Russian media activity during NATO exercises will increase the size of the daily network of users in the NATO conversation, and it will become more centralized and interconnected.*

The results from these models are partially supportive of Hypothesis 4. Figure 5 demonstrates that an increase in the number of IRA tweets is associated with a larger size of the daily user network, which supports Hypothesis 4. The blue line in the graphic is less steep than the red, which means that the IRA's actions have a weaker effect on the network size when there is a NATO exercise than when there is none. The higher starting point of the blue line is expected because the dataset for this research is based on the online NATO conversation. Thus, when such military drills occur, more Twitter accounts are likely to become active and join the online NATO communication. The multiplicative interaction term between NATO exercises and Russian media tweets is not statistically significant; thus, it is impossible to determine if there is a consistent conditional relationship between these variables. However, the coefficient for *IRA Tweets* is statistically significant ($p < 0.01$) and positive (0.349). Thus, over the entire research period, both on exercise days and non-exercise days, increased levels of *Russian Media Tweets* were associated with a larger network size in the NATO conversation, which also supports Hypothesis 4.

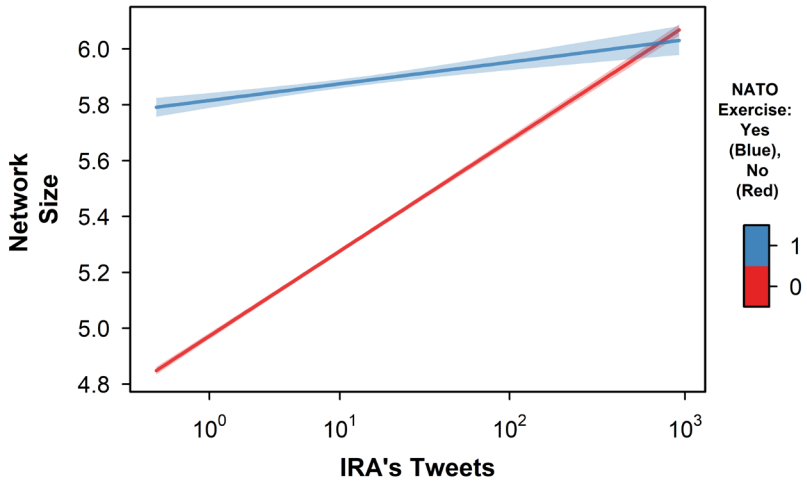

Figure 5. NATO Exercises and IRA Tweets vs. Network Size

In contrast, Model 9's results show that the online behavior of the IRA and Russia's overt media have different effects on the centralization of the daily networks. The results are partially supportive and partially contrary to Hypothesis 4. The blue lines on both graphics in Figure 6 lie below the red ones, which demonstrates that during NATO exercises, the centralization of the networks is lower than during periods without such military drills. However, the online behavior of the different types of Russian actors has an opposite effect on network centralization. When the IRA increases its online activity, centralization decreases. By contrast, when overt Russian media outlets are more active, centralization increases. Therefore, only findings about the effect of Russia's overt media organizations on network centralization support Hypothesis 4.

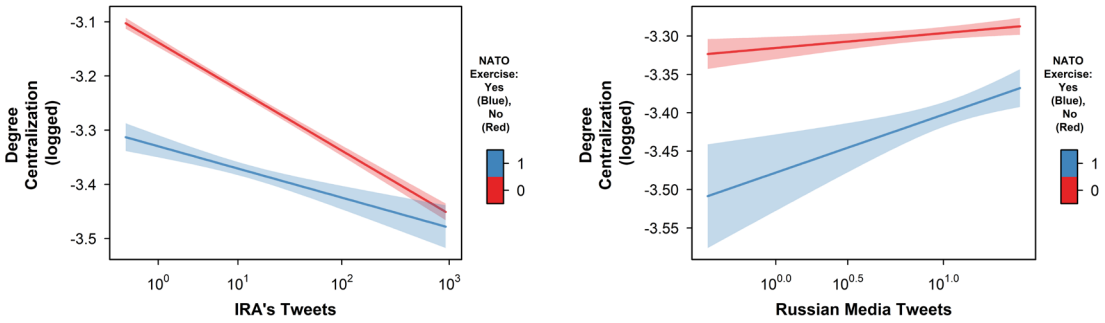

Figure 6. NATO Exercises, IRA Tweets, and Russian Media Tweets vs. Degree Centralization

The clustering coefficient is a measure of the network interconnectedness. It provides information on the degree to which the accounts in the explored daily networks have second-order ties. Figure 7 illustrates Model 10's results, which support Hypothesis 4. The clustering coefficient increases when Russia's covert and overt media organizations are more active. NATO exercises also lead to a further increase of interconnectedness in the daily networks.

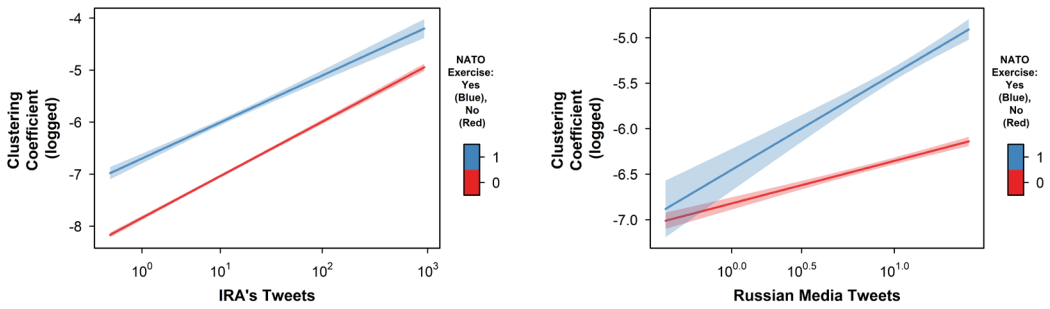

Figure 7. NATO Exercises, IRA Tweets, and Russian Media Tweets vs. Clustering Coefficient

C. DISCUSSION

In the examined period, July 2013 to August 2014, the regression analysis demonstrates that there is a statistically significant relationship between the sentiment of the online conversation about NATO and the online activities of Russia's overt and covert media organizations. At that time, the IRA was in its initial stage of formation. As Howard et al. point out, the agency used Twitter as a "training ground for the political polarization efforts."[111] The goal of IRA operatives then was to create "beachheads" in social networks by attracting followers, infiltrating online media platforms groups, and gaining credibility for its fake accounts. The prevalence of such preparatory actions could be one of the reasons why we observe the IRA's activity increasing the probability for positive sentiment in the research period, contrary to the expectations of Hypothesis 1.

Closer examination of the effects reveals that the influence potential of covert organizations is higher than that of overt media (Figure 2, Chapter V). This finding is logical because covert agencies can use fake identities or accounts to avoid attribution, infiltrate various online conversations, and implement tactics such as the "4D Approach" described by Nimmo.[112] At the same time, overt media outlets and the journalists who work for them cannot avoid this attribution, and the targeted audience can perhaps,

[111] Howard et al., "The IRA, Social Media and Political Polarization in the United States, 2012–2018," 10.

[112] Nimmo, "Anatomy of an Info-War: How Russia's Propaganda Machine Works, and How to Counter It."

Page 2904 of 3957

therefore, more easily rebuff some of the information. This effect could explain why the regression model indicates that overt actors are weaker influencers than covert ones.

The findings about the effects of IRA and Russian media tweets during NATO exercises demonstrate that only the IRA's online activities have a statistically significant impact on sentiment. In this case, the model shows that the increase in the number of IRA tweets results in a lower probability for positive sentiment among network users. At the same time, the multiplicative interaction term combining NATO exercises with the online activity of Russia's overt media is not statistically significant. A possible interpretation of this regression result is that Russian media outlets did not target the NATO audience when the exercises took place. Another finding of the model supports this interpretation. The interaction term combining Russian exercises and IRA tweets is also not statistically significant. This result implies that the IRA's leadership probably did not make consistent use of its capabilities to manipulate the Twitter audience and influence their attitudes in favor of Russian military activities.

Although the model's results show that covert actors are more efficient in Twitter influence campaigns than overt media, the latter also have some advantages. First, they legally operate on social media platforms under their genuine identities. In this manner, the platforms cannot easily restrict their activities as long as the accounts adhere to the platforms' established rules and policies. In contrast, covert media agencies rely on fake accounts that act in violation of these regulations, and they could be banned or suspended at any time. As with all covert assets, their activity is efficient only as long as they operate hidden from their target. Second, official media companies, especially in the case of Russia, are quasi-private, and they can receive generous state funding to establish vast networks and create quality content. In return, they can be expected to coordinate and align their information policy with the ruling political elite.[113]

Both types of organizations can produce diverse online content adapted to specific social groups and geographical regions. The regression model indicates that there is a statistically significant relationship between the prevailing sentiment of tweets and their

[113] Hanley and Kuzichkin, *Russian Media Landscape*, 13–30.

Page 2905 of 3957

authors' distance from the Russian border, conditioned by whether there is a NATO exercise or not (Figure 4, Chapter V). It demonstrates that in the vicinity of the Russian border, the probability for positive tweets is much lower when a NATO exercise takes place than when there is none. The farther from Russia the tweet originates, the greater the probabilities for positive sentiment—regardless of whether a NATO exercise is in progress. This result suggests that the Twitter users closer to the Russian border are more sensitive about NATO exercises. One of the possible reasons for this effect is that the dataset includes, by definition, a significant number of Russian accounts. In addition, as the discussion in Chapter III revealed, in the countries from the so-called 'near abroad' there are many communities that share Moscow's attitude towards NATO. These social groups are more susceptible to Russian "soft power" because of their common language, ethnicity, religion, or shared history.[114] The regression results also support this explanation. Figure 8 presents a situation where a Russian military exercise occurs, showing that the probability for positive sentiment is significantly higher near the border of Russia than when there is no exercise. In the absence of an exercise, the probability is almost constant as a function of distance to Russia.

[114] Rotaru, "Forced Attraction?," 3–9.

Page 2906 of 3957

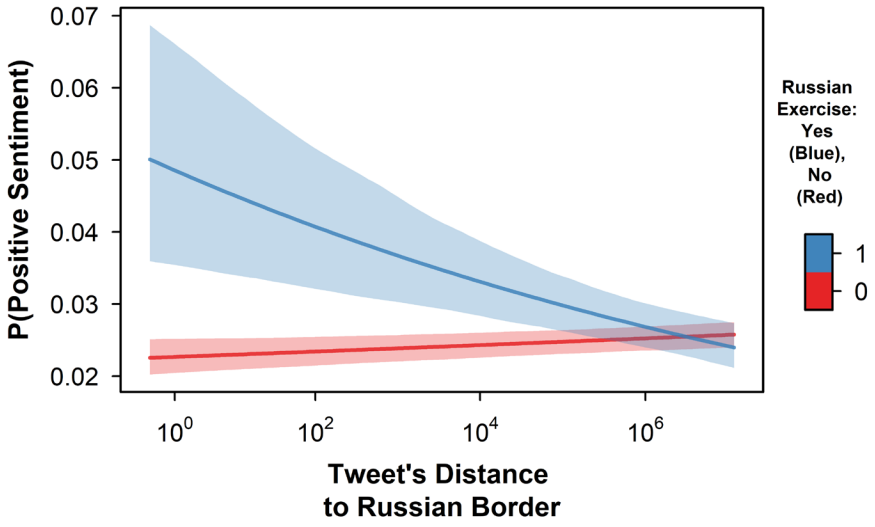

Figure 8. Russian Military Exercises and Distance to Russia vs. Probability of Positive Sentiment

The regression analysis of the daily networks of Twitter users also reveals statistically significant relations between the activity of Russia's overt and covert information agencies and network topology measures. This conclusion suggests that, during NATO exercises, these networks change their topology due to the actions of overt Russian media outlets and the covert operations of entities such as the IRA. In line with Hypothesis 4, the network becomes larger, and the clustering coefficient is higher when NATO exercises occur than in periods without military drills. Their values further increase if IRA or Russian media intensify their activity on Twitter. The finding on network enlargement can be explained by the expected appearance of new accounts engaging in the online conversation about NATO when that organization's exercises take place. The observed change in the clustering coefficient suggests that IRA and online media accounts also increase their second-order interactions. They start tweeting, mentioning, or quoting each other more frequently. This interconnectedness becomes even higher during NATO exercises. However, there is an important difference between the effect of the online activities of the IRA and the overt media outlets, as Figure 6 shows. During NATO exercises, IRA activities increase the network interconnectedness at the same rate as they do during periods without exercises. Howard et al. explain that "IRA accounts typically

operated in 'teams' of co-mentioners …[that]… tended to mention teammates far more often than non-teammates; thus, forming a number of coherent communities of interaction."[115] Similarly, Russian media organizations push the conversation to become more interconnected, but with a rate that increases substantially during NATO exercises. In other words, participants in the online conversation about NATO start retweeting, mentioning, or quoting each other more during NATO exercises.

Although the regression results for degree centralization partially support Hypothesis 4, they also reveal more specific patterns. Contrary to Hypothesis 4, the increase in IRA tweets results in a decrease in centralization. On the other hand, Russian media activity increases the centralization of the daily networks. These findings suggest that the increase in the Russian media's online activity probably makes some nodes in the network more central. This conclusion corresponds to the qualitative findings in Chapter III that several central and larger online news agencies such as RT, Sputnik, and Ruptly appear to dominate the Russian media landscape. In contrast, covert entities such as the IRA seem to represent as a more "egalitarian" network composed of what Howard et al. referred to as small "communities of interaction" with a more similar number of ties.

[115] Howard et al., "The IRA, Social Media and Political Polarization in the United States, 2012–2018," 26.

Page 2908 of 3957

VI. CONCLUSIONS

This thesis has sought to examine the conversation about NATO on Twitter and to explore the relationships between the average sentiment in that conversation and the online activities of Russia's overt and covert online media agencies. In addition to the sentiments expressed in the tweets, the thesis analyzed how the basic topology measures of the social networks hosting this conversation relate to the online activity of overt Russian media and so-called troll factories. The thesis's research period was one year, from July 1, 2013, through August 31, 2014. The focus was on the conversation about NATO that appeared on Twitter and the activity on Twitter caried out by the major Russian media outlets and the Internet Research Agency during the NATO exercises that occurred in this period. The regression analysis of the online conversation about NATO in the specified period provided evidence of a statistically significant relationship between the sentiment of the tweets and the online actions of the Russia's covert and overt agencies. Several findings follow from the tested models' results.

First, the overall sentiment of the online conversation about NATO generally becomes more positive if there is an increase in online activity by the IRA and overt Russian media. Further, the IRA's tweets have a more substantial impact on the probability for sentiment change than do tweets by Russia's traditional media outlets. Both the overt and the covert Russian actors more effectively influence positive than negative sentiments.

Second, the prevailing sentiment of the online conversation about NATO during NATO exercises becomes more negative as the online activity of covert Russian media organizations increases. When a NATO exercise takes place, an increase in the IRA's online activity results in a decreased probability for positive sentiment. By contrast, when there is no NATO exercise, the probability for positive sentiment increases when the number of IRA messages increases.

Third, the sentiment expressed in tweets during NATO exercises is generally more negative if the location of the tweet's originator is closer to the borders of the Russian Federation.

Page 2909 of 3957

Fourth, IRA and Russian media online activity during NATO exercises increases the size of the daily network of users participating in the conversation on NATO, and that network becomes less centralized and more interconnected. During NATO exercises, Russian media activities online tend to increase the centralization of the daily network. In comparison, the IRA seems to act as a more "egalitarian" network composed of small teams with a similar number of ties.

These conclusions suggest that close tracking and examination of the online activities of Russia's covert and overt media agencies can provide the necessary base for detecting ongoing information operations. However, their proper identification faces specific difficulties. First, today's social media platforms are rapidly increasing their number, making monitoring Russian online activities difficult and resource-consuming. Second, each social media platform has its own specific and often restrictive rules for sharing information about its users' behavior and how other individuals can extract and collect such data. As in the example of the Twitter API,[116] there is a limit on the number of tweets collected as well as on access to historical data.

Nonetheless, further refining of the analytical methods can overcome some of these limitations and deliver a more comprehensive outcome. These improvements should focus on several directions. First, the measurement of sentiment in tweets could include machine learning algorithms that can increase the precision of the final result. Second, the online activities of covert agencies similar to the IRA can be tracked across different online platforms by natural language processing algorithms. They have great potential to discover patterns in online communication that will enable the timely identification of trolls' accounts.

Finally, it is hoped that the results of this thesis contribute to our better understanding of Russian information operations. These results indicate that the activities of Russia's covert and overt media agencies can effectively influence online conversation and shape public perception. Although the thesis focuses on the narrow topic of NATO

116 Twitter, "Twitter API Documentation," February 27, 2022, https://developer.twitter.com/en/docs/twitter-api.

Page 2910 of 3957

exercises, its results could have implications for other significant events such as elections, referendums, or conflicts such as the February 2022 war between Russia and Ukraine. The results demonstrate that the online activities of companies such as the IRA need close monitoring. The thesis's findings show that the IRA's actions more substantially affect online conversation than do channels operated by Russia's overt media.

Moreover, the events during the current war between Ukraine and Russia suggest that the role of covertly operating troll networks can be even more significant in a time of crisis or conflict. The European Union imposed restrictions on RT and Sputnik media platforms and publicly labeled them as sources of disinformation in 2022.[117] As a result, major online platforms including Twitter, Facebook, and Instagram declared that they will comply with the sanctions and will prevent these Russian media networks from posting content.[118] Such restrictions will reduce the ability of these covert influencers to interact with targeted audiences and diminish their role in the information operations. In this situation, only networks covertly established by trolls can continue to operate and affect the information environment. Thus, preventive measures against information operations must include constant monitoring and timely counteraction of such networks as well.

Page 2926 of 3957

Preface

Information operations (IO) are essential to the successful execution of military operations. The goal of IO is to gain and maintain information superiority that translates to a competitive edge in the information environment.

Users of Training Circular (TC) 18-06, *Special Forces Guide to Information Operations,* must be familiar with the decisionmaking process established in Army Doctrine Publication (ADP) 5-0, *The Operations Process,* and the operational concepts established in ADP 3-0, *Unified Land Operations.*

PURPOSE

This TC serves as a guide to describe the fundamentals of how to incorporate IO at the tactical and operational level. Appendixes A through F offer tactics, techniques, and procedures (TTP) Special Forces (SF) Soldiers can use to analyze and plan information operations. This TC implements Army and joint IO doctrine established in FM 3-13, *Inform and Influence Activities,* and Joint Publication (JP) 3-13, *Information Operations.*

This TC reinforces the definition of IO used by Army forces: IO employs the core capabilities of electronic warfare (EW), computer network operations (CNO), Military Information Support operations (MISO), military deception (MILDEC), and operations security (OPSEC), in concert with specified supporting and related capabilities, to affect or defend information and information systems and to influence decisionmaking. This TC is specifically targeted for SF; however, it is also useful to Army special operations forces (ARSOF) and the Army in understanding how SF employs IO.

SCOPE

TC 18-6 significantly affects the conduct of full-spectrum operations as an SF-common skill set that applies to offensive as well as defensive operations. This TC links to a broad variety of doctrine to provide a rudimentary understanding of IO.

APPLICABILITY

This publication applies to the Active Army, the Army National Guard/Army National Guard of the United States, and the United States Army Reserve, unless otherwise stated.

ADMINISTRATIVE INFORMATION

The proponent of this manual is the United States Army John F. Kennedy Special Warfare Center and School (USAJFKSWCS). Reviewers and users of this manual should submit comments and recommended changes on Department of the Army Form (DA Form) 2028 (Recommended Changes to Publications and Blank Forms) to Commander, United States Army John F. Kennedy Special Warfare Center and School, ATTN: AOJK-CDI-SF, 3004 Ardennes Street, Stop A, Fort Bragg, NC 28310-9610.

Page 2927 of 3957

Chapter 1

Fundamentals

IO should be viewed as an element of combat power, focused when and where it best supports the operation. As with other elements of combat power, there is no universal formula for the application of IO. Mission, enemy, terrain and weather, troops and support available-time available, and civil considerations are the major determinants.

The purpose of IO is to achieve and maintain information superiority or advantage over the adversary at a particular time and place. To achieve an information advantage, an SF unit must understand the characteristics of the information environment in its operational area. The unit must also understand how adversary and third-party organizations use information to achieve their objectives.

Operation VALHALLA

Operation VALHALLA was a typical SF-type mission. The Jaish al-Mahdi death squad was tracked down because of the especially brutal murders of a number of civilians and Iraqi troops. On 26 March 2006, a battalion from the 10th Special Forces Group (Airborne) (SFG[A]), as part of the Combined Joint Special Operations Task Force—Arabian Peninsula (CJSOTF-AP), along with the Iraqi special forces unit it was training, engaged the Jaish al-Mahdi at their compound. The mission was successful with no friendly casualties. There were approximately 17 Jaish al-Mahdi members killed, a weapons cache found and destroyed, a badly abused hostage found and rescued, and approximately 16 Jaish al-Mahdi members detained. A combat-camera element, along with some SF Soldiers wearing helmet cameras, recorded the entire operation.

By the time the SF and Iraqi forces returned to their compound, roughly an hour after leaving the site of the firefight, someone had moved the Jaish al-Mahdi bodies. The guns of the Jaish al-Mahdi fighters were taken, and their bodies were put back inside the compound so it appeared as if the Jaish al-Mahdi members were killed while engaging in prayer. Someone then photographed the bodies in these new poses, and loaded the images onto the web, along with a press release explaining that American Soldiers had entered a mosque and killed men peacefully at prayer. This was done in under an hour. Both the American and Arab media picked up the story almost immediately. The United States (U.S.) did not release a statement until 70 hours after the operation. During the resulting investigation, which took close to a month, the SF Soldiers, who had soundly and justly defeated their adversary, were made combat ineffective by a cell-phone camera.

Paraphrased from an article written by Cori E. Dauber
Military Review
January–February 2009

Page 2928 of 3957

Key terms used throughout this chapter are defined below:

- *IO.* The integrated employment, during military operations, of information related capabilities in concert with other lines of operation, to influence, disrupt, corrupt, or usurp the decisionmaking of adversaries and potential adversaries while protecting our own.
- *Information environment.* The aggregate of individuals, organizations, and systems that collect, process, disseminate, or act on information.
- *Information superiority.* The operational advantage derived from the ability to collect, process, and disseminate an uninterrupted flow of information while exploiting or denying an adversary's ability to do the same.

INFORMATION OPERATIONS

1-1. The possession and use of information can provide a marked advantage to one military force over another. SF units expend significant time and resources to collect, process, and internally transfer information for the purpose of mission command. Without adequate and accurate information, an SF unit is unlikely to successfully accomplish its mission or meet its objectives.

1-2. Stated in the simplest way, IO is the use of information to gain an advantage over an opponent. Such an advantage, known as information superiority, is achieved by a series of actions by military and other forces to impact both enemy forces and the operational area. To gain the advantage over the adversary, an SF unit should use any available capability at its disposal, whether doctrinal or not, to achieve information superiority at specific times and places in the operation. Figure 1-1 describes the five core capabilities, five supporting capabilities, and three related capabilities of IO. IO forces can affect data, information, and knowledge in three basic ways by—

- Taking specific psychological, electronic, or physical actions that add, modify, or remove information from the environment of various individuals or groups of decisionmakers.
- Taking actions to affect the infrastructure that collects, communicates, processes, and stores information in support of targeted decisionmakers.
- Influencing the way people receive, process, interpret, and use data, information, and knowledge.

Core Capabilities	*Supporting Capabilities*	*Related Capabilities*
Electronic Warfare (EW)	Information Assurance (IA)	Public Affairs (PA)
Computer Network Operations (CNO)	Physical Security	Civil-Military Operations (CMO)
Military Information Support Operations (MISO)	Physical Attack	Defense Support to Public Diplomacy (DSPD)
Military Deception (MILDEC)	Counterintelligence (CI)	
Operations Security (OPSEC)	Combat Camera (COMCAM)	

Figure 1-1. Information operations capabilities

1-3. Thinking about IO within the terms of this doctrinal construct may do injustice to IO's true capabilities. Field experience shows that IO is less about doctrinal capabilities than it is about understanding that every military action has the potential to positively and negatively affect populations within the operational environment. In the end, everything an SF unit or detachment does or does not do can affect the information environment, and any asset that affects information content and flow is a possible contributor to (or detractor from) achieving the mission or the commander's objective. For this reason, IO should include any methods and means that can affect information content and flow, and target perceptions and behaviors in the operating area.

THE INFORMATION ENVIRONMENT

1-4. To use IO properly, SF commanders and staffs must understand the characteristics of the information environment in their operational area. Unfortunately, visualization of the information environment is challenging because the most important aspects of the information environment—information content and flow—cannot be seen the same way we see terrain. This is because information is an abstract concept and the information environment is largely nonphysical.

1-5. The information environment has existed since humans first began communicating. That is because information resides in the minds of humans, is communicated between humans, and is the end result of how humans perceive themselves and their surroundings. To explain this phenomenon, most practitioners of IO use a three-dimensional model of the information environment (Figure 1-2).

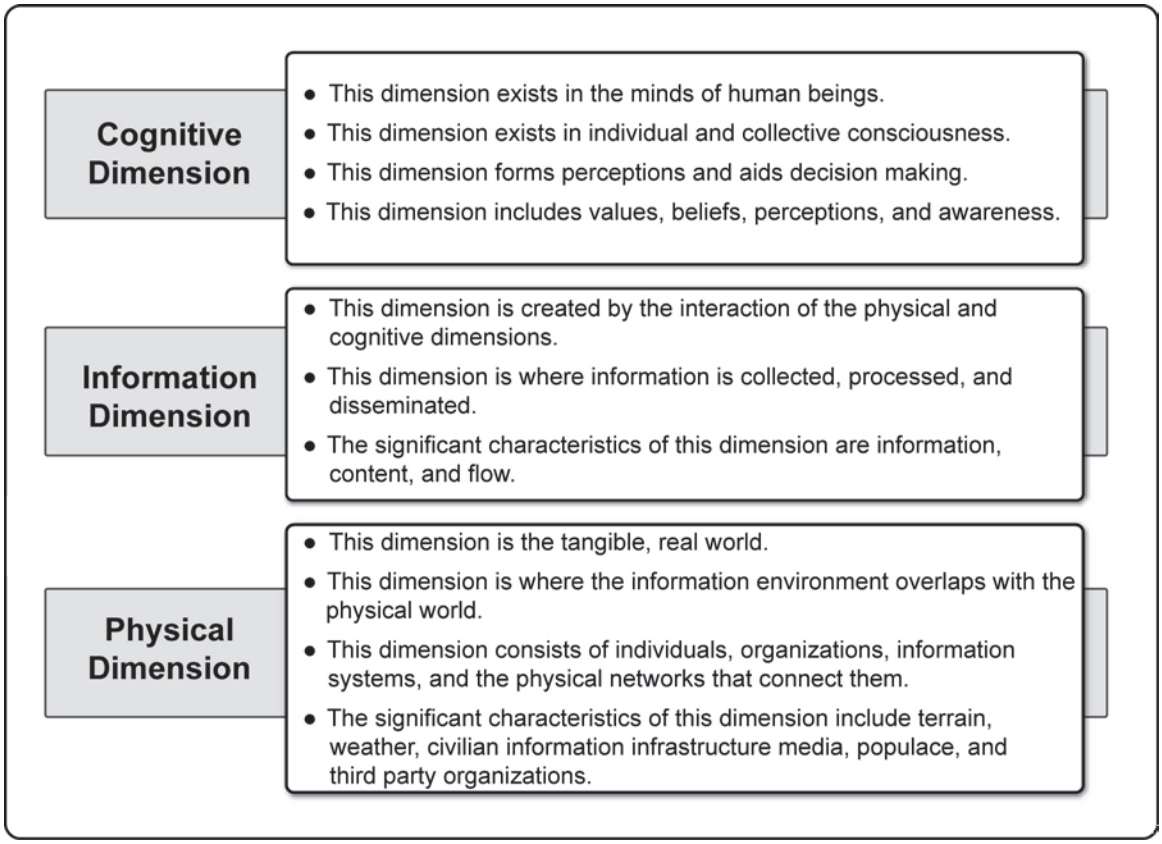

Figure 1-2. Information environment

1-6. When taken together, the information environment's three dimensions explain how the creation and flow of information causes real-world effects by converting real-world (physical) situations into human perceptions that form the basis of individual and organizational behavior. Unfortunately, although the effects of information are observable, the cause—information content and flow—is largely invisible. However, analysis of the information environment's dimensions can explain the disposition of the information environment in any specific operational area and its impact on SF operations. Broad considerations include the following:

- *The information environment is not uniform.* Physical features of the operational area (for example, terrain, information infrastructure, population demographics, and so on) determine the topography of an information environment and the cognitive aspects of the people and organizations present in the area (for example, their collective values, beliefs, and perceptions). The interactions of these factors form distinct subinformation environments, or areas in which the information environment's characteristics are notably different from those of adjacent areas.

Analysis of a specific operational area can identify subinformation environments and their effect on SF operations. SF units must anticipate having to employ IO differently within each subinformation environment.

- *Information content and flow are variable.* The relevance or importance of information changes according to the needs of the various population groups and organizations. For example, people located in an area devastated by a natural disaster desire information concerning humanitarian assistance, whereas the populace in an insurgent-infested area is primarily interested in information related to security. The task for SF units is to determine what information in the operational area is important to the mission and then to identify and track its primary themes and flow, just as SF units observe and monitor the presence of enemy forces.
- *The information environment's character changes by the level of war and mission.* The information environment becomes less tangible and more conceptual as operations move from the tactical to the strategic. At the tactical level, information flow is primarily by short-range communications systems and observable means, such as graffiti and banners. What people see of their physical surroundings is critical to their situational awareness, perceptions, and behavior. On the other end of the spectrum—the strategic level—the information environment is impacted less by physical features and more by abstract ideas, ideologies, and philosophies. Information flow is not terrain-dependent, extending well over the horizon by long-range and mass-communications systems. Finally, the assigned mission (for example, combat, peacekeeping, humanitarian assistance, and so on) is a critical determinant of an SF unit's relationship to its information environment because it establishes the relative importance of the information environment's specific characteristics to the conduct of operations. For example, in conventional combat, the physical information infrastructure in the operational area is often a dominant characteristic because of its potential use by the enemy. In counterinsurgency missions, populace support (a cognitive aspect of the information environment) is a critical characteristic because of its importance to enemy and friendly operations.

1-7. To impact the information environment, an SF unit must identify subinformation environments and information nodes in its operating area. Subinformation environments are areas in which the information environment's characteristics and effects are notably different from those of adjacent areas. Information nodes are places, persons, or infrastructure that shape information content and flow by creating or transmitting information into the surrounding area. It is important to note that information nodes can change from day to day so what worked one day may not necessarily work the next.

1-8. Operations in the information environment are asymmetrical and not benign, often favoring one side over another. Opposing forces use the information environment just as they use the physical environments of air, land, and sea to place their enemy at a disadvantage and to achieve their objectives. Furthermore, U.S. adversaries do not use the information environment in the same way or have the same means as U.S. forces. Understanding this, an SF unit must identify how its adversary views and uses the information environment. This is a challenge, because even though two opposing forces occupy the same operational environment, they will not have the same capabilities in the information environment. It is important to avoid *mirror imaging* U.S. concept of IO upon the adversary and mismatching U.S. capabilities and vulnerabilities to those of the adversary. Chapter 5 provides additional information.

INFORMATION SUPERIORITY

1-9. Information superiority is the purpose of IO. It is also the reason why a commander allocates resources to IO. Information superiority should not be treated as a doctrinal catch-phrase. Just as each mission's end state is different, so is information superiority. For example, during combat operations, information superiority can be gaining surprise over the enemy or preventing the enemy from employing its reserve forces. During counterinsurgency operations, information superiority can be gaining populace support for friendly operations or preventing enemy freedom of flow. In each case, information superiority is defined specifically for the mission in terms of what advantage is sought for the friendly force.

1-10. To achieve information superiority, an SF unit uses information to actively attack the adversary and to shape the information environment to the force's own advantage. This duality of operations—attacking

the adversary and shaping the information environment—is analogous to “fires and maneuvers,” where fires equate to attacking the adversary’s ability to use information, and maneuvers are actions to seize and retain information nodes to gain a positional advantage in the information environment. To be effective, an information operation balances lethal and nonlethal activities to attack the adversary with those that shape the information environment. Through a combination of both, an SF unit seeks information superiority over its opponent.

1-11. An SF unit will rarely achieve absolute and universal information superiority. The actions of opposing forces, as well as the information content and flow in the operational area, are not static. Therefore, information superiority is a localized and transitory condition over the adversary. SF units seek information superiority at certain times and places, usually at or before the decisive point of the operation. Chapter 3 provides additional information.

INFORMATION OPERATIONS CAPABILITIES

1-12. SF operations are not planned for the purpose of using any particular capability. Mission requirements, namely campaign objectives, operating environments, and adversary and friendly forces, dictate what capabilities a commander uses and how they are employed. IO are no different.

1-13. Although often described as a discrete set of capabilities (doctrinally organized as core, supporting, and related capabilities), IO are much more than that. Capabilities used for information operations should be selected based on mission requirements, specifically focused on the desired effect. Some doctrinal IO capabilities—MISO, EW, and CNO—require trained specialists and equipment. However, each element of an SF unit must be able to employ OPSEC, MILDEC, and COMCAM, as well as other IO enablers, such as key-leader engagements and rewards programs. Additionally, various IO capabilities are used in concert with PA, Civil Affairs (CA), host nation (HN), foreign internal defense (FID), partner nation information capabilities, and select interagency capabilities (for example, provincial reconstruction teams). Chapter 2 provides additional information leverage.

CONSIDERATIONS

1-14. Subject-matter experts for core IO capabilities are typically positioned at the special operations task force (SOTF) level and higher when deployed; however, it is essential that commanders at detachment levels understand the core capabilities of IO and how to effectively utilize them to achieve information superiority and accomplish the assigned missions. SOTF staffs can include an IO planner, EW planner, Military Information Support (MIS) planner, a MIS detachment commander, a CA planner, and a COMCAM and PA representative. At the joint special operations task force (JSOTF) level, the staff mirrors the battalion with the addition of a special technical operations planner and the group public affairs officer (PAO), along with retaining the conduits to leverage the higher headquarters (HQ) assets and interagency capabilities. The subject-matter experts at the SOTF and JSOTF can provide training and recommendations to the Special Forces operational detachments A (SFODAs) and Special Forces operational detachments B (SFODBs) on how best to utilize information capabilities, and provide assistance in coordination and deconfliction for IO capabilities in support of their concept of operations.

CONCLUSION

1-15. IO is the use of information as a military capability. Many of the principles and concepts that guide the conduct of other military operations also guide the employment of IO. One way for SF commanders and staffs to integrate IO into operations is to consider IO in terms of the factors of mission, enemy, terrain and weather, troops and support available-time available, and civil considerations:

- *Mission.* The role of IO in the unit mission is to achieve information superiority. As such, it is important to identify exactly what advantage over the enemy IO is expected to achieve.
- *Enemy.* Gaining an advantage over the adversary in the information environment starts with pairing friendly capabilities and vulnerabilities in the information environment against those of the adversary. An information operation that defeats the adversary’s capabilities and turns the information environment to the friendly force’s favor will achieve information superiority.

- *Terrain and weather*. Terrain and weather interact with the information environment to affect information content and flow as well as the employment of IO capabilities. SF units must adjust the employment of IO to the terrain and weather.
- *Troops and support available.* Rarely does an SF unit have all the assets needed to conduct an information operation. Commanders and staffs can fill the gap by thinking beyond doctrine for other ways and means to affect information content and flow.
- *Time available.* Regardless of echelon, IO requires long lead times compared to other operations. Typically, IO must be planned one phase or event in advance of fire and maneuver.
- *Civil considerations.* When civil considerations are important to the unit mission, IO capabilities can be applied to influence the populace, if doing so will achieve an advantage over the adversary.

Chapter 2

Information Operations Capabilities and Tactics

This chapter focuses on the employment of IO capabilities and tactics to gain information superiority. It also shows the links among the capabilities in diagram form. The core and supporting IO capabilities are similar to the warfighting functions. They are independent capabilities that, when taken together and synchronized, constitute IO. IO planners must not let doctrine constrain their selection of capabilities. Any available assets, means, capabilities, or tactics that can shape the information environment or target the adversary's ability to use information should be considered for employment as part of IO.

The use of assets and means for the purposes of IO require judgment in application. Some capabilities—notably MISO, EW, and CNO—are disciplines that require specialized training and skill sets. Employment of these capabilities requires specialized technical expertise to properly plan and execute. Other capabilities already reside within a command or unit and require only planning and coordination to employ them as part of IO. Figure 2-1 outlines some of the more commonly employed IO capabilities.

	Capability	*Employment*
Doctrinal Capabilities	OPSEC	Deny critical friendly information to the adversary.
	MILDEC	Mislead adversary leaders into making decisions that are favorable to friendly forces.
	MISO	Change or reinforce attitudes and behavior favorable to friendly objectives.
	EW	Degrade, disrupt, or deny adversary use of the electromagnetic spectrum (EMS).
	CNO	Degrade, disrupt, or deny adversary use of cyberspace.
	COMCAM	Visually document friendly and adversary forces' operations and activities.
	CMO	Gain local populace acceptance and support.
	PA	Inform populace groups and counter misinformation and propaganda.
Tactics	COMCAM	Visually document friendly and adversary forces' operations and activities.
	Local populace and key-leader engagements	Gain support for friendly-force operations and HN government activities.
	Countering adversary information	Neutralize hostile propaganda or mitigate its effects.
	Rewards program	Influence adversary leaders' perceptions.

OPERATIONS SECURITY

2-1. OPSEC is a universal IO capability. It is not just an "in-garrison" competency and needs to be operational at strategic, operational, and tactical levels. OPSEC should be included in all plans, operations, and activities. The goal of OPSEC, in conjunction with unit security programs, is to achieve essential secrecy. Essential secrecy is concerned with the content and flow of critical information. Military forces seek critical information about their opponents to fulfill their own information needs. To do this they attempt to collect accurate, timely, and relevant information, process the information, and disseminate it for use in planning and directing operations. Conversely, if a military force is to prevent its adversary from gaining useful information, then it must prevent the flow of critical information from friendly to adversary forces. At its core¸ OPSEC is an approach to conducting operations. To have a good OPSEC program, it is imperative that the unit identify this critical information, understand the OPSEC indicators and vulnerabilities, and practice essential secrecy. JP 1-02, *Department of Defense Dictionary of Military and Associated Terms*, defines essential secrecy as *the condition achieved by the denial of critical information to adversaries.* Essential secrecy depends on the combination of two approaches to protection—security programs to protect classified information, and OPSEC to deny adversaries critical information (which is often unclassified).

2-2. Each command and operation has a tremendous amount of information, both classified and unclassified, that must be protected. However, denying all information about a friendly operation or activity is seldom cost-effective or realistic. Central to this idea is the concept of essential secrecy. By achieving essential secrecy, military forces protect their intentions, capabilities, and activities to retain initiative and the element of surprise for operations. As a condition, essential secrecy is not static—it must first be developed and then maintained as the situation and mission evolve. Essential secrecy cannot be achieved in all places and at all times; therefore, the protection of information must be focused and prioritized to counter specific threats.

2-3. Essential secrecy and the protection of critical information is not the exclusive responsibility of OPSEC. It is the result of mutually supportive OPSEC and security programs. The purpose of OPSEC is to prevent, or at least limit, the flow of sensitive, unclassified information to adversary forces. The actual content of the information, whether classified or unclassified, is the responsibility of information security program controls and procedures. OPSEC denies critical, friendly information to the adversary by eliminating or reducing to an acceptable level the vulnerabilities of friendly actions to adversary exploitation. Because OPSEC is not the sole contributor to essential secrecy, an IO objective can integrate other capabilities—such as MILDEC, physical security, information security, and CI—that are not related to OPSEC.

2-4. OPSEC is a process of identifying and protecting critical information and actions that could benefit the adversary. A good OPSEC operation starves the adversary's intelligence system by denying it the information it seeks. Without information on friendly organization, disposition, and intent, the adversary leader's decisionmaking is degraded.

2-5. The basis for OPSEC's contribution to an operation is the commander's key tasks for IO. This means that, for OPSEC to be part of an information operation, at least one essential IO task should address the protection or defense of friendly information.

2-6. Although the purpose of OPSEC is a constant, its focus may change by echelon. At the tactical level, OPSEC prevents the adversary's detection and identification of friendly activities and operations to prevent the targeting of critical assets and countering of current activities and operations. Operational-level OPSEC prevents the disclosure of intentions, capabilities, and future operations (that is, courses of action [COAs]) to avoid the compromise of planning and operations. Tactical-level OPSEC addresses specific measures to defeat the adversary's collection capabilities; whereas, at the operational level, OPSEC addresses broad guidance or general measures for the entire force and new measures to counter the adversary's intelligence capabilities.

2-7. As a way to systematically identify, analyze, and protect critical information relevant to the mission, OPSEC is integrated into the military decisionmaking process. Figure 2-2, pages 2-3 and 2-4, depicts a summary of the five-step OPSEC process.

Note. The five-step process is used at the JSOTF where the assets to form an OPSEC working group exist. At the tactical level, the type of information contained in the OPSEC work sheet (Figure 2-3, page 2-4) and the OPSEC tasks (Figure 2-4, page 2-5) needs to be considered when developing a concept of operations.

1. **Identify Critical Information.** Determine what information needs protection by identifying the information required by the adversary to prevent friendly-force mission success (list of critical information or essential elements of friendly information [EEFI]). Adversaries can derive critical information from the aggregation of indicators resulting from the observation or detection of friendly-force activity. Friendly actions generate indicators (detectable actions and open-source information) that can be collected and developed into critical information (facts about friendly intentions, capabilities, and activities). An adversary can plan and execute its own operations by using critical information. To identify critical information—
   - Identify what information is critical to the friendly mission. Sources of critical information include higher HQ plans and operations orders, commander's guidance, and current unit-critical information lists. Focus on friendly-force intentions (time and place of units and operations), capabilities, and vulnerabilities (strength, technologies, and tactics).
   - Keep in mind that critical information is different for every operation. Do not use a "cookie-cutter" approach. Continually develop or refine critical-information lists.
   - Use an OPSEC working group to take advantage of subject-matter experts (for example, aviation, communications, and computer systems).
   - Identify the length of time each element of critical information must be protected (not all information needs protection for the duration of the operation).
   - Write critical information in the form of a statement (do not write critical information in the form of a question). Generic examples include current and future locations of unit elements; intelligence, surveillance, and reconnaissance capabilities and limitations; and unit movement methods and routes.
   - List the elements of critical information (for example, time and route of helicopter flight) in the order of priority and keep to a manageable number (perhaps five).
2. **Analyze Threat.** Identify the threat to the critical information by determining the adversary's information needs and collection capabilities:
   - Information needs are items of information the adversary requires. Do not bother trying to protect information that the adversary already has.
   - Collection capabilities include human intelligence (HUMINT), signals intelligence (SIGINT), imagery intelligence, and open-source intelligence (OSINT). An estimated 90 percent of the adversary's information needs are met from OSINT.

   Example threat analysis: Adversary knows: personnel and equipment move by helicopter; adversary needs: departure times and routes of flight; adversary collection method: visual observation by spotters.
3. **Analyze Vulnerabilities.** Identify each element of critical information and its vulnerability to adversary intelligence collection. These are known as OPSEC vulnerabilities and are the result of detectable indicators of the critical information. OPSEC indicators become OPSEC vulnerabilities if they can be observed, analyzed, and acted upon by the adversary. To determine OPSEC vulnerabilities:
   - Identify OPSEC indicators. Determine what detectable actions and OSINT can be interpreted or pieced together by the adversary to derive the unit's critical information.
   - Compare OPSEC indicators to adversary collection capabilities. Determine which indicators can be observed, analyzed, and acted upon by the adversary.

   Example OPSEC vulnerabilities: Direction of flight, helicopters taking off, loading of troops and equipment, and assembly of troops and equipment.
4. **Assess Risks.** The goal is to reduce risk to an acceptable level based on the commander's guidance. Conduct a risk assessment for each vulnerability to determine which really need protection. Focus on the

Figure 2-2. Summary of the five-step operations security process

vulnerabilities that produce the most risk to mission success and, therefore, are an unacceptable risk, and then select one or more OPSEC measure for each vulnerability:

- There are three types of OPSEC measures:
  - Action controls that change unit procedures, activities, and actions (randomized routine activities, avoid repetitive tactics and procedures).
  - Countermeasures that disrupt enemy information gathering and targeting (jamming [EW], physical attack, and camouflage, cover, and concealment).
  - Counteranalysis that deceives the enemy by providing false indicators (decoys, deception in support of OPSEC).
- Decide which OPSEC measures to implement. Check that OPSEC measures do not create new vulnerabilities. Balance OPSEC measures with operational effectiveness (risk versus unit resources). Developing OPSEC measures is a balance between cost and resources in terms of time, personnel, assets, and interference with operations.

Example OPSEC vulnerabilities and mitigating measures: direction of flight (fly in false direction, change direction en route), helicopters taking off (vary flight times, conduct false missions), loading of troops and equipment (load just prior to takeoff), assembly of troops and equipment (assemble troops and equipment under cover).

5. **Apply OPSEC Measures.** Tasks turn OPSEC measures into specified actions. Because OPSEC measures do not follow any doctrinal format, it is necessary to convert them to tasks that the executing units and elements can understand. Develop tasks that support the command's key IO tasks, as well as protect and control the specific indicators associated with key operational tasks:

- Rewrite approved OPSEC measures as tasks. A useful format is task, purpose, and method. In general, for OPSEC, a *task* is an action that controls or protects observable activities, *purpose* can be critical information requiring protection, and *method* is the OPSEC means or methods used to execute the task.

Example OPSEC task that supports combat operations: task—jam enemy ground surveillance radars, purpose—conceal flow of combat elements from electronic collection, method—screen jamming.

Example OPSEC task to support stability operations: task—deny civilian populace access to base-camp overwatch sites, purpose—prevent line-of-sight observation of security activities, method—unit patrols, local police.

- Assign responsibility and coordinate OPSEC tasks with units and staff, to include the intelligence directorate of a joint staff (J-2)/assistant chief of staff, intelligence staff section (G-2)/intelligence staff officer (S-2), and CI for monitoring, and then include OPSEC tasks in the operation plan or operation order.

Figure 2-2. Summary of the five-step operations security process (continued)

EEFI	*Vulnerability*	*Indicators*	*Adversary Collection*	*Risk Level*	*OPSEC Measure*	*Residual Risk*	*Assess*
Location of unit elements	Assault-force insertion	Rotary-wing movement	Sympathetic populace	Extremely High	False insertions	Medium	No adversary contact on ground flow
		Ground movement	Direct observation	High	Reconnaissance element placed on route	Low	Adversary surprised on objective

Figure 2-3. Useful format for determining risk to critical information

EEFI	*Adversary Collection*	*Vulnerable Indicators*	*Standing Operating Procedures or Current OPSEC Measures*	*Additional OPSEC Measures*	*OPSEC Tasks*
Task organization	Spotters on forward operating bases and main supply routes	Vehicle markings	Cover vehicles markings	Remove unit markings	1st Battalion 2d Battalion
		Command vehicles	None	No unsecured communications	Group HQ

Figure 2-4. Useful format for planning operations security tasks

2-8. During operations, the current operation staff should monitor and adjust the elements of critical information based on the adversary's reaction to the implemented OPSEC tasks and for inadvertent disclosure by friendly forces. Tools useful to planning and implementing an OPSEC plan are the OPSEC working group, OPSEC standing operating procedures (SOPs), and OPSEC work sheets.

2-9. The OPSEC working group is a group of subject-matter experts that determines critical information, identifies OPSEC vulnerabilities, coordinates and synchronizes OPSEC measures and tasks, and assesses the effectiveness of OPSEC tasks. Typical membership includes an intelligence analyst to assist with threat analysis, CI personnel to analyze vulnerabilities, a force protection officer, communications and aviation representatives, and subordinate unit liaison officers. The OPSEC working group should conduct periodic assessments of command critical information, threat collection capabilities, OPSEC vulnerabilities, and OPSEC measures.

2-10. An OPSEC SOP is critical to ingraining OPSEC into unit operations. The SOP should be short and direct and should include standing critical information or EEFI, standing OPSEC measures, composition and responsibilities of the OPSEC working group, and OPSEC assessment procedures.

MILITARY DECEPTION

2-11. JP 1-02 defines MILDEC as *actions executed to deliberately mislead adversary military decision makers as to friendly military capabilities, intentions, and operations, thereby causing the adversary to take specific actions (or inactions) that will contribute to the accomplishment of the friendly mission.*

2-12. MILDEC is more of a process or way of thinking than a capability with tangible assets and resources. It may be executed using a unit's own troops and equipment. An effective deception does not have to be elaborate or complex; however, any time deception is part of an operation, it is the main effort for the information operation and should be included in the defined operational advantage (information superiority) provided for the mission.

2-13. MILDEC is a method, not a result. MILDEC is not conducted merely to deceive an adversary. Deception is used only to support the mission. Figure 2-5 shows ways to employ MILDEC.

Application	*Purpose*	*Focus*
MILDEC	Achieve an exploitable advantage	The adversary's leaders and decisionmakers
Deception in support of OPSEC	Deny information about friendly forces	The adversary's intelligence, surveillance, and reconnaissance capabilities
Deception as part of camouflage, concealment, and decoys	Protect units, systems, and personnel	The adversary's weapons and target-acquisition system

Figure 2-5. Military deception usage

2-14. MILDEC actively targets adversary leaders and decisionmakers in support of specific battles and engagements. It creates an exploitable advantage by misleading or confusing the adversary's decisionmaker. Distorting, concealing, or falsifying indicators of friendly intentions, capabilities, or dispositions that the adversary will see and collect can mislead or confuse the adversary. MILDEC is conducted at all levels—strategic, operational, and tactical—and must be carefully coordinated to deconflict operations between the HQ and subordinate units.

2-15. Deception in support of OPSEC is conducted to reinforce unit OPSEC and is planned using the OPSEC plan as the basis for the deception. A deception in support of OPSEC uses false information about friendly forces' intentions, capabilities, or vulnerabilities to shape the adversary's perceptions. It targets the adversary's intelligence, surveillance, and reconnaissance abilities to distract the adversary's intelligence collection away from, or provide cover for, unit operations. A deception in support of OPSEC is a relatively easy form of deception to use and is very appropriate for use at battalion-level and below. To be successful, a balance must be achieved between OPSEC and MILDEC requirements.

2-16. Camouflage, concealment, and decoys are normally individual or unit responsibilities and governed by SOP. These actions may be taken for their own ends. They can also play a role in a larger MILDEC or deception in support of OPSEC operations where camouflage, concealment, and decoys comprise just a few of many elements that mislead the adversary's intelligence, surveillance, and reconnaissance abilities. Merely hiding forces may not be adequate, as the adversary may need to "see" these forces elsewhere. In such cases, cover and concealment can hide the presence of friendly forces, but decoy placement should be coordinated as part of the deception in support of OPSEC.

2-17. The uncertainties of combat make decisionmakers susceptible to deception. The basic mechanism for any deception is either to increase or decrease the level of uncertainty (commonly referred to as ambiguity) in the mind of the deception target. Both MILDEC and deception in support of OPSEC present false information to the adversary's decisionmaker to manipulate their uncertainty. Deception may be used in the following ways:

- *Ambiguity-decreasing deception.* This type of deception presents false information that shapes the adversary decisionmaker's thinking so he makes and executes a specific decision that can be exploited by friendly forces. This deception reduces uncertainty and normally confirms the adversary decisionmaker's preconceived beliefs so the decisionmaker becomes very certain about his COA. By making the wrong decision, which is the deception objective, the adversary could misemploy forces and provide friendly forces an operational advantage. For example, ambiguity-decreasing deceptions can present supporting elements of information concerning a specific adversary's COA. These deceptions are complex to plan and execute, but the potential rewards are often worth the increased effort and resources.
- *Ambiguity-increasing deception.* This deception presents false information aimed to confuse the adversary decisionmaker, thereby increasing the decisionmaker's uncertainty. This confusion can produce different results. Ambiguity-increasing deceptions can challenge the enemy's preconceived beliefs, draw enemy attention from one set of activities to another, create the illusion of strength where weakness exists, create the illusion of weakness where strength exists, and accustom the adversary to particular patterns of activity that are exploitable at a later time. For example, it can cause the target to delay a decision until it is too late to prevent friendly-mission success. It can place the target in a dilemma for which there is no acceptable solution. It may even prevent the target from taking any action at all. Deceptions in support of OPSEC are typically executed as this type of deception.

2-18. Before planning a deception, it is first necessary to determine if there is a deception opportunity. A deception may be a feasible option if it is appropriate to the mission and if there is a possibility of success against the adversary. The following questions should be considered when planning deception:

- *Is the adversary susceptible to deception?* Planners should use the J-2/G-2/S-2 adversary COA as a basis to develop information about the adversary's system and decisionmaking process. Planners should determine how the deception target acquires and acts on information, what knowledge the target has of the situation and how the target views the friendly force. If

necessary, planners should make assumptions. To do this, they should try to place themselves in the position of the adversary without mirror imaging.

- *Does the friendly mission lend itself to deception?* Some missions are better suited to deception than others. Planners should not feel compelled to work deception into every operation. Generally, when a unit has the initiative and can exercise some control over the mission area of operations (AO), then deception is possible.
- *Do constraints prevent the use of deception?* Other than the constraints imposed by authorities and political considerations, the most important consideration is time. Execution of the mission must allow enough time for the adversary to see the deceptive activities, reconstruct the activities into the deception story, form the desired perceptions, and issue the orders that will cause the adversary force to act in a manner consistent with the deception objective.
- *Are friendly assets available?* To successfully deceive the adversary, MILDEC requires assets. However, very few assets are specifically designed and designated for deception purposes. This means that existing assets have to dedicate support to the deception. This is sometimes difficult, especially when assets are limited. Therefore, the unit may have to be creative to find assets and to use them efficiently.

Note. JSOTF will support strategic MILDEC plans and plan operational MILDEC. At the SOTF and below, units will use tactical MILDEC. Appendix B provides additional information and a tactical deception aid format.

2-19. As with other operations, deception planning follows the military decisionmaking process. Planning a deception does not have to be difficult, but there are certain steps that must be taken to ensure the deception is properly constructed. The steps are as follows:

- *Determine the deception goal.* The deception goal is the desired contribution of the deception to friendly-mission success. In other words, what advantage does the deception provide for friendly forces (for example, provide target opportunities for friendly forces)?
- *Determine the deception objective.* The deception objective is the purpose of the deception operation expressed in terms of what the adversary is to do or not to do at the critical time and location. In simpler terms, it is the action or inaction that friendly forces want the adversary to take (for example, cause insurgent forces to move into the open).
- *Identify the deception target.* The target is the adversary decisionmaker with the authority to make the decision that will achieve the deception objective (for example, the insurgent group commander).
- *Identify desired perceptions.* These are what the deception target must believe to make the decision that will achieve the deception objective. Based on the deception objective and target, the planner must determine the nature of the desired perceptions—will they increase or decrease the target's uncertainty (ambiguity increasing or decreasing)? Desired perceptions eventually translate to resource requirements; therefore, the number of perceptions should be kept to an absolute minimum to conserve the assets needed for the deception (for example, U.S. forces are going to attack from the south).
- *Develop the deception story.* The deception story is a plausible, but false, view of the situation which leads the deception target to act in a manner that accomplishes the deception objective. To be plausible, the story must be integrated into the overall COA. The story is built and stated exactly as the planner wants the target to reconstruct it. To develop the deception story, the planner thinks about how the target sees the situation and then writes the story like the deception target's own intelligence estimate. The story is always written from the target's perspective—what does the target expect to see and think and what will he do (for example, indications are that U.S. forces are massing to the south in preparation for an attack)?
- *Identify the deception means.* These are the methods, resources, and techniques that the unit will use to create required observables (things the adversary decisionmaker needs to see to deduce the desired perceptions) and act out the deception story. The planner must determine for each desired perception what means—physical, technical, and administrative—can be used. Physical means

are observable physical activities of forces, systems, and individuals that present visual indicators. Technical means include radio broadcasts, radar emissions, and electromagnetic deception. Administrative means are used to convey oral, pictorial, documentary, or other material evidence to the deception target.

- *Develop deception events.* These are the activities conducted by the deception means at a specific time and location to convey the deception story to the target. To convey the deception story, the deceptive activities must be observed by the adversary. To determine this, planners pair up the available deception means with the capabilities of the adversary's intelligence collection system. If the adversary intelligence system can "see" the deceptive event, then it can collect the information it needs to piece together the deception story. Deception events must be translated into tasks to subordinate units if the deception operation is to be executed (for example, loudspeaker simulating vehicle traffic, SFODA present in area).
- *Develop OPSEC measures.* Without OPSEC to deny critical information to the adversary, the deceptive activities may not convince the adversary to believe the deception story. In order for the deception to be successful, the unit must adhere to a strict need-to-know policy.
- *Develop assessment requirements.* Collecting feedback is a difficult challenge. However, to judge the effectiveness of the deception, it is necessary to have indications of how the target is responding to the deception. Ideally, there will be indicators of whether the target is receiving the deception story as planned, and if the target is acting in accordance with the deception objective (for example, insurgents move from building to highway).
- *Develop a termination plan.* A deception operation does not just end on its own. Part of the operation is a termination plan that establishes when organized deception activities cease, and how deception means, techniques, and events will be protected. This is important, because there is no logic in executing a deception after the objectives have been met. Additionally, the adversary should not know what deception means, techniques, and events were used. Otherwise, the next deception operation may not have the desired effect due to the adversary gaining insights into friendly TTP.

2-20. In time-constrained deception operations, the "see–think–do" methodology can be used as an abbreviated planning process. The planner uses this process by identifying what he wants the target to *do* (for example, the deception objective), then determines what the target must *think* (for example, required perceptions), and then establishes what the target must *see* (for example, deception events).

2-21. Deception operations cannot proceed without approval or coordination. Two authorities can direct a deception operation: a higher HQ and the unit commander. In both cases, the command's deception plan must be coordinated with the higher HQ. To ensure coordination, deception plans are normally approved two levels above the employing unit HQ. It is imperative that a deception be thoroughly coordinated to prevent information fratricide; that is, employing deception in a way that causes effects in the information environment that impede the conduct of friendly operations or adversely affect friendly forces.

2-22. The military deception work sheet (Figure 2-6, pages 2-9 through 2-11) is a tool that can be used to capture the key elements of the deception plan. Elements of planning information are listed on the work sheet in the order they are developed using the deception methodology.

<table>
<tr><td>Unit Mission: (Concise restatement of the mission. Identifies the operational goal(s) of the command to which the deception must contribute.)

Establish a bridgehead across the Knewt Canal to rapidly advance forces deep into Towie territory and occupy key terrain on Sangria Ridge.</td><td>Deception Constraints: (Identify constraints on the command from higher to lower as they affect the deception plan.)

All liaison activities with members of friendly foreign governments and Allies that concern this operation will not be conducted with prior approval by the Atari Chief of Staff of the military.

War stocks, particularly ammunition, will be stored, handled, transported, and issued with exercise ammunition. The perception that Atari is conducting Exercise SACRED HEART must be maintained.

Wartime SOPs, wartime communications, and wartime modes of operation will not be implemented until two hours prior to commencement of the actual attack operation.</td></tr>
<tr><td colspan="2">Commander’s Guidance for Disposition/Deception Goal: (Describe the desired effects or the end state a commander wishes to achieve [commander’s intent for the deception operation].)

Intent: We will mask the plans for our attack and build-up of our military strike forces by massing supporting logistic elements, the forward deployment of our assault engineers and air defense umbrella, and our increased communications under the guise of Exercise SACRED HEART (the annual Atari command post and maneuver exercise). Exercise SACRED HEART provides the overall cover to conceal our actual intentions.

End State: Numerically and qualitatively superior combat, combat support, and combat service support elements of the Atari 1st Army will be fully deployed on the south bank of Knewt Canal to execute canal crossing operations, drive deeply into Towie territory, and occupy key terrain on Sangria Ridge.

Atari Commander’s Goal Statement: Use MILDEC to achieve operational surprise during Atari canal crossing operations; and enable Atari freedom of maneuver during our drive to the Sangria Ridge.</td></tr>
<tr><td colspan="2">Deception Objective: (Describe the desired action or inaction on the part of the adversary at the critical time and location.)

Cause the Towie front commander to delay mobilization and commitment of the Towie strategic reserve in response to operations. (Note: If a delay in mobilization and commitment of the strategic reserve is achieved, this delay then contributes to/supports the Atari commander’s goal statement of achieving surprise.)</td></tr>
<tr><td colspan="2">Deception Target: (Identify adversary decisionmakers responsible for the actions(s) or inaction(s) specified in the deception objectives.)

The Towie front commander has sole authority to mobilize and commit the Towie strategic reserve—he is the single and only decisionmaker that can make this decision.</td></tr>
<tr><td colspan="2">Desired Perceptions: (Describe what the deception target must believe for it to make the decision that will achieve the deception objective.)

The Towie front commander must believe:

- The Atari military is not preparing for immediate combat operations against the Towie forces or nation.

- The Atari military is conducting Exercise SACRED HEART to improve wartime fighting efficiency, mission command, and logistics; hence, the buildup of its military forces.

- Towie intelligence should detect visible signs of impending combat operations, but Atari forces would be preparing for an exercise and training in the open.</td></tr>
<tr><td>Deception Story: (Outline a scenario of friendly actions or capabilities that will be portrayed to cause the deception target to adopt the desired perception.)

Atari military forces are conducting Exercise SACRED HEART. The purpose of Exercise SACRED HEART is to improve the fighting efficiency, mission command, and logistics of the Atari Army via the exercise’s numerous training and maneuver phases.</td><td>Deception Means: (Describe how the plan will be implemented and how it supports the unit’s overall mission.)

Atari forces can employ the following MILDEC means to get the target to take the action desired: physical, technical, and administrative. These means can be employed independently or in collaboration depending on the situation.

(continued)</td></tr>
</table>

Figure 2-6. Example of a military deception work sheet

	Physical means are those activities and resources used to convey or deny selected information to the decisionmaker. Physical means include operational activities and resources such as: - The movement of the Atari Army and Air Force. - Exercise SACRED HEART subexercises and training events. - Atari logistic actions and the location of stockpiles and repair facilities during Exercise SACRED HEART. - Reconnaissance and surveillance activities performed during Exercise SACRED HEART. ***Technical means*** are the military material resources and their associated operating techniques used to convey or deny selected information to an adversary. As with any use of Atari military material resources, any use of technical means to achieve MILDEC will strictly comply with Atari domestic and international law. A variety of technical means include the following: - Deliberate radiation energy is accomplished when Atari command posts, reconnaissance and surveillance, and air defense networks go operational during Exercise SACRED HEART. - Atari multimedia (radio, television, sound broadcasting, or computers). ***Administrative means*** include resources, methods, and techniques designed to convey or deny oral, pictorial, documentary evidence. The best example of this is a well-publicized announcement (all media outlets) of the upcoming Exercise SACRED HEART.
Assessment: *(Describe the methodology to assess the deception plan if the plan is successful; if the deception fails, or is compromised to Allies or adversaries.)* The command military deception officer will use feedback and intelligence information collected by the command's intelligence officer/directorate to assess if the deception plan is successful, has failed, or had been compromised. Feedback: Is the information providing indications of the response (positive or negative) of the deception target and conduits to elements of the deception. Target (Analytical) Feedback: This is information or analytical determinations regarding the actions of the target in response to the deception executed by the deceiver. Conduit (Operational) Feedback: This is information that provides indications of if and how the conduits are receiving, processing, and transmitting elements of the deception to the target. Indications of identification of enemy deception and counterdeception are provided by the command's intelligence officer/directorate. It is their responsibility to identify foreign deception operations against friendly forces.	**OPSEC Measures to Protect Deception:** *(What OPSEC and other countermeasures are to be used to protect the deception plan from compromise.)* OPSEC measures to implement include the following: - The true nature of the operation will be strictly enforced by using the principles of "need to know." - Encrypted communications, secure land lines, and couriers will be used to convey information about our true intentions. All other traffic will use the Exercise SACRED HEART communications network to pass information. - The Exercise SACRED HEART SOP is in effect command wide; implement the wartime SOP during Exercise SACRED HEART pause but no later than two hours prior to commencement of the actual operation. - No special emphasis will be placed on camouflage and concealment of actual assault forces. In the vicinity of crossing sites standard camouflage and concealment practices to be in place and enforced. - Standard counterintelligence operations are executed throughout the exercise area but with increased focus on the crossing site areas. - OPSEC assessments and monitoring will be in effect up until the time of the attack.

Figure 2-6. Example of a military deception work sheet (continued)

	Termination Plan: *(What is the plan for terminating he deception plan if the desired effects are achieved, not achieved, or compromised?)* Reasons for Termination: - Success. *The deception operation has run its course and the MILDEC operation concludes because the deception target (Towie front commander) took the action envisioned in the MILDEC plan.* - Change of mission scenario. *The overall operation situation has changed and events and circumstances that prompted the deception operation no longer pertain or are applicable and the MILDEC operation is terminated by executing commander.* - Recalculated Risk/Success/Probability of Success Scenario. *Key elements in the deception have changed in a negative way that increases the risks and costs (for example, casualty estimates rise) to the commander and the commander elects to end the deception.* - Failure Scenario. *The deception target does not understand key elements of the deception or does not care about the deception elements being executed and therefore he fails to take the action envisioned in the MILDEC plan. The MILDEC plan is terminated because the Towie front commander has not taken the bait.* - Compromise. *The deceiver believes the adversary has learned some or all elements of t he actual deception operation. Compromise of the deception poses special challenges to the deceiver and the termination process. Not only can important deception capabilities and techniques be placed at risk, but once the adversary has discovered the MILDEC operation he may be able to "read the evidence" and reconstruct the tails of the MILDEC. Worst case scenario—the enemy (Towie front commander) may be able to exploit the compromised deception by initiating his own counterdeception operation to counter/negate the true operation.*

Figure 2-6. Example of a military deception work sheet (continued)

MILITARY INFORMATION SUPPORT OPERATIONS

2-23. The purpose of MISO is to induce or reinforce foreign attitudes and behavior favorable to the originator's objectives. In simpler terms, MISO seek to change or reinforce foreign attitudes to further U.S. national objectives.

2-24. The more deliberate the planning process is prior to execution, the more likely the MISO effort will be coordinated and integrated with the supported unit's plans. Planning for MISO begins the process of identifying specific individuals, groups, or organizations to influence as part of the commander's overall objectives. When the MISO process is properly executed, it provides the commander with a formidable tool to gain a decisive advantage on the battlefield and potentially save lives.

2-25. Key terms discussed throughout this chapter are defined below:

- *MISO programs* support U.S. national policy and objectives and are approved by the Under Secretary of Defense for Policy (USD[P]) through the interagency process. Approved MISO programs provide the framework for the execution of MISO in support of the range of military operations. MISO programs include objectives, themes to stress, themes to avoid, potential target audiences, attribution posture, means of dissemination, a concept of operations, and funding sources. To execute MISO, U.S. policy requires a USD(P)-approved MISO program be in effect

for the operation in question as well as specified execution authorities in the form of an execution order, operation order, or theater security cooperation plan.

- A MISO *theme* is an overarching subject, topic, or idea. It often comes from policymakers who establish the parameters for conducting MISO by delineating the themes to stress and avoid.
- *Target audiences* are groups of people that can effect achievement of the commander's mission and toward which actions are directed. Planning for MISO requires a thorough analysis of each group's attitude, behavior, susceptibility, and sources of information to determine which themes, messages, and means will effectively influence the group to exhibit the desired behavior.
- *MISO objectives* are general statements of measurable response that reflect the desired behavioral change of foreign target audiences and best support the accomplishment of the supported commander's mission. Generally, the MISO objective is written at the geographic combatant commander level and is part of the geographic combatant commander's overall campaign plan.
- *Supporting MISO objectives* are the specific behavioral responses desired from the target audience to accomplish a given MISO objective. Supporting MISO objectives are unique for each MISO objective, and each MISO objective always has two or more supporting MISO objectives.
- *MISO series* consist of all the MISO products and actions designed to accomplish one behavioral change by a single target audience.
- *Distribution* is the movement of completed MISO products from the production source to the point of dissemination.
- *Dissemination* is the delivery of MISO products directly to the target audience. Planners must keep in mind that each target audience varies greatly in their access to a particular medium, whether it is radio, television (TV), newspapers, posters, and so on. Additionally, the ability of target audiences to understand the message varies because of language, cultural, or other barriers.

Note. An essential element of effectively planning for MISO is integration into the targeting process. This allows MIS forces the opportunity to get the rest of the staff to understand the importance of its nonlethal targets and the psychological effects of planned operations on target audiences.

2-26. Tactical-level MISO are typically conducted by MIS forces (directly attached at the SFODA level) through close-range means, such as face-to-face meetings, loudspeaker broadcasts, or by pinpoint distribution of products, such as leaflets to a particular village.

2-27. Strategic-level MISO focuses on conveying select information to international regional foreign audiences. Operational-level MISO focuses on a theater of operations, whereas tactical-level MISO focuses on conveying select information inside a tactical unit's AO. Because MISO are planned and executed at all levels, it is important that they be mutually supporting or complementary of other United States Government (USG) information activities, as well as other information capabilities (for example, PA and OPSEC). Generally, tactical-level MIS units will use this higher-level guidance as the basis for their own information activities.

Note. The proximity to the target audience does not determine the level of support (tactical, operational, or strategic). Mission analysis and, ultimately, the MISO objective determine the level of support. Likewise, the impact of a MISO effort at the tactical level can have operational or strategic implications.

2-28. Generally, a joint MISO task force assigned to the higher joint command provides direct guidance to all MIS forces in-theater to coordinate MISO at the strategic, operational, and tactical levels. Depending on the mission, either a company- or detachment-sized MIS element will typically support the JSOTF or a SOTF. Task organization is tailored in accordance with the mission, available resources, and priority of effort.

2-29. The primary mission of a MIS company supporting a JSOTF is to conduct operations that influence behavioral responses and advise the commander of those responses and their impact on the operation. The

MIS company typically supports a variety of tactical-level special operations forces missions, monitors the psychological state of target audiences in the operating environment, and analyzes adversary information activities. It can develop, produce, and disseminate tactical-level products within the guidance assigned by the approval authority. The company consists of a company HQ section with a span-of-control of three to five detachments. Development and production of MISO products are typically conducted at the company level.

2-30. A MIS detachment attached to the SOTF is comprised of a HQ section and three to six teams comprised of three to five Soldiers. The MIS detachment provides direction and oversight of the teams. The MIS detachment does product-dissemination planning by determining dissemination priorities and tracking the dissemination of products within the AO. (FM 3-53, *Military Information Support Operations*, and FM 3-05.301, *Psychological Operations Process, Tactics, Techniques, and Procedures*, provide a complete description of the responsibilities and duties of the respective MIS elements.) The team is a three- to five-man element led by an E-7; the team is generally task-organized down to the SFODA. The E-7 also serves as the MIS planner and advisor to the SFODA/SFODB commander and is responsible for the integration and employment of the team. The MIS team is the link between the SF commander and local target audiences in a given AO. This linkage is possible through face-to-face communication and rapport-building with local nationals. Whether conducting loudspeaker operations in support of combat operations or collecting information, on target audiences and the operational environment, the MIS team is a tactical asset that can significantly influence overall operations. Because of its integrated nature, the team is most effective when maintained as a cohesive element. After-action reviews suggest the division of a team decreases its capability.

2-31. A tactical MIS team can perform the following functions during combat operations:

- Reduce the adversary's will to fight. MIS Soldiers can use loudspeakers and leaflets to instill and exploit the fear of death or defeat in the adversary; undermine the adversary's confidence in their leadership; decrease their morale and combat efficiency; and encourage surrender, defection, or desertion.
- Support deception activities through employment of loudspeaker assets and other means.
- Minimize civilian interference with military operations.
- Monitor and assist in efforts to counter propaganda in the AO.
- Plan, develop, and monitor a key-leader engagement strategy for supported commanders to ensure this critical influence tool is appropriately aimed at achieving the commander's objectives.

2-32. During stability and support operations, in addition to discouraging civilian interference and assisting in efforts to counter propaganda, MISO can support the following:

- *Humanitarian assistance.* MIS units support humanitarian assistance operations by providing information on program benefits, shelter locations, food and water points, and medical-care locations. MIS units also publicize humanitarian assistance operations to build support for the United States and HN governments.
- *Peacekeeping.* MISO help gain acceptance for U.S. or allied forces in the AO, thereby gaining support and compliance with U.S. and allied policies and directives, and increasing support for HN governments or military and police forces.
- *Noncombatant evacuation operations.* MIS units support these operations by reducing interference from friendly, neutral, and hostile target audiences and by informing evacuees.
- *Demining operations.* MISO educate the target audience on the dangers of mines, how to recognize mines, and what to do when a mine is encountered. MIS units encourage target audiences to report locations of mines and unexploded ordnance.
- *Foreign internal defense.* MISO help build and maintain support for the HN government and its forces while decreasing support for insurgents.

2-33. In the execution of the MISO series, the team leader coordinates the dissemination of all products through the higher MIS detachment and the maneuver unit. Products normally comprised of standard visual products, such as posters, handbills, and novelty items; audio products, such as loudspeaker

broadcasts, radio messages, and compact discs; and audiovisual products, such as video compact discs or digital videodiscs. In dissemination, the team follows the guidelines set forth in the series dissemination work sheet, which gives specific instructions for required dissemination to the appropriate target audiences. As part of its support to MISO development, the team provides details on possible dissemination sites and optimal dissemination times.

2-34. Whatever dissemination means are used, the MISO messages communicated to the target audiences are guided by themes. A theme is a subject, topic, or idea used as a planning tool to develop a MISO series. For MISO, a theme is developed through target audience analysis based on approved MISO objectives and formulated to affect the attitudes or behaviors of the target audience. As such, themes are broad, somewhat static, and not communicated to the target audience. At the tactical level, MISO themes should be the basis for all communication with the adversary, local populace, and any other target audiences. The two types of themes are the themes to be stressed and the themes to be avoided. The list of themes to stress and avoid can be found in the higher HQ MIS annex. The following are examples of themes:

- *Themes to stress.* Only local people can resolve problems, coalition forces do not favor any group or faction, and displaced persons should return to their homes. Themes to be stressed vary according to the target audience:
  - *Enemy forces.* Themes include inevitability of defeat, hardship and privation, and absence from loved ones.
  - *Local population.* Themes to stress include security and stability, reconstruction and economic prosperity, tribal and cultural, nationality and history (for example, Iraq is a multi-ethnic, tribal-sect-dominated state), insurgents are criminals and miscreants.
  - *Foreign governments.* Themes to stress include commitment and resolve, international security, and cooperation.
  - *Third-party organizations.* Themes to stress include security, stability, and solidarity with military forces.
- *Themes to avoid.* Themes to avoid include religious issues, cultural comparisons, women's roles in local society, themes that appear to favor one faction or group over another, and themes that degrade local ethnic, cultural, or religious values.

2-35. A message is a communication of the theme, whether visually, audibly, or in written form. Messages are communicated to the target audiences to influence their attitudes and behavior. As such, messages are specific, constantly evolving with the situation, and tailored to specific target audiences. Messages may take either of the following forms:

- *Spoken.* Messages can be spoken communication delivered in TV and radio broadcasts, talking points delivered during face-to-face communication or loudspeaker broadcasts.
- *Written.* Written messages can be delivered by leaflets, handbills, or posters.

In any case, a message is a single thought to be conveyed from U.S. forces to the enemy or other target audience (such as the local populace).

2-36. Because of the number of messages and themes available to the commander for his information activities, it is imperative that the IO staff coordinate and synchronize all messages (for example, MIS planner, PAO, CA planner) emanating from the commander. This deconfliction should ensure that messages from different elements are not contradicting one another and that the correct message is communicated to the correct target audience at the right time and place.

2-37. MISO are not the only IO capability that produces themes and communicates messages to the adversary or populace. PA produces and uses PA themes and messages to communicate with the media and inform the populace. MILDEC may communicate deceptive messages to the adversary. Therefore, MISO, PA, and MILDEC must coordinate and synchronize themes and messages so that the correct message is communicated to the correct target audience at the right time and place to avoid information fratricide.

2-38. By using MISO, the commander brings to bear a force-multiplier that uses its capabilities to degrade the enemy's will to fight, reduce civilian interference, minimize collateral damage, and maximize the local population's support for operations. MIS forces do this by using assets at their disposal to reach local and over-the-horizon targets with different visual, audio, and audiovisual products. Proper employment of

MISO means fewer casualties (friendly, enemy, and civilian), fewer U.S. troops required to accomplish the mission, shorter operations, and less damage to infrastructure. Success in these areas results in faster reconsolidation of combat elements, less required rebuilding of infrastructure, and ultimately, quicker return of a nation to self-sufficiency.

2-39. When employing MISO, there are three primary limitations to consider. First, only personnel school trained in MISO and designated by their Service as MIS officers or Soldiers should develop MISO series (although any friendly-force element can disseminate products and conduct face-to-face engagements). Second, there are legal and political factors that may restrict the use of MISO. MISO must follow U.S. and international laws, especially when used without a declaration of war. The third constraint is time. MISO planning must begin early in the operation and continue throughout if it is going to effectively influence the target audience in time to support the operation. FM 3-53 and FM 3-05.301 provide further details on MISO planning and TTP.

ELECTRONIC WARFARE

2-40. EW plays a major role in attacking and exploiting the adversary's ability to use information, while defending the U.S. ability to process information. By definition, EW is any military action involving the use of electromagnetic and directed energy to control the EMS or to attack the enemy. It consists of three divisions: electronic attack (EA), electronic protection, and electronic warfare support. EA is the use of electromagnetic energy, directed energy, or antiradiation weapons to attack personnel, facilities, or equipment with the intent of degrading, neutralizing, or destroying enemy combat capability. EA is considered a form of fires. Electronic warfare support involves actions taken to search for, intercept, identify, and locate or localize sources of intentional and unintentional radiated electromagnetic energy for the purpose of immediate threat recognition, targeting, and planning. Electronic protection involves passive and active means taken to protect personnel, facilities, and equipment from any effects of friendly or enemy employment of EW. Of EW's three major components, EA has the most direct role in support of IO, especially at the tactical level. At the tactical level, EA is primarily used to attack adversaries by jamming the electromagnetic frequencies used by the adversary (degrading or disrupting information flow) or using the EMS to deceive the adversary (affecting the information content available to decisionmakers).

2-41. The objective of EA planning and execution is to ensure use of the EMS for friendly forces while preventing the adversary's effective use of the spectrum. Electromagnetic jamming denies the adversary the use of its receivers by overwhelming them with high-powered signals on the same frequency as the receiver. Procedurally, this is accomplished through spectrum management and deconfliction. Spectrum management controls frequencies that all friendly emitters use to prevent interference and fratricide. Deconfliction is the process used to avoid conflicts in frequency usage. It is also used during mission execution to resolve interference problems.

2-42. To meet the technical requirements of EA, an EW officer is often needed to effectively plan, coordinate, monitor, and assess friendly and adversary force activity in the EMS. However, depending upon the unit, an EW officer may not be authorized. If the unit does not have an EW officer, EA responsibilities will usually fall to the IO planners. In such a case, IO planners should research the EW assets available to the command from higher HQ and establish contact with representatives from the units that possess the assets.

2-43. Synchronization of EW tasks is imperative. Up to a certain point in the operation, friendly forces may want adversary decisionmakers to communicate, so they do not want to tip off the adversary by jamming too early in the operation. Additionally, lack of frequency deconfliction can result in information fratricide among friendly forces.

2-44. Basic planning considerations for EA include the following:

- *Enemy vulnerabilities.* The J-2/G-2/S-2 should have an electronic order of battle and other intelligence products that identify how the enemy uses the EMS—which systems are critical to adversary operations, what those systems are used for, and what frequencies those systems use. This information helps determine specific electromagnetic vulnerabilities that may be exploited.

- *Friendly capabilities.* Tactical units have limited organic EA assets. Most EA assets are assigned at higher echelons. It is important to know specific capabilities organically available to the unit, as well as those assets that are available through higher HQ.
- *EA deconfliction.* Frequency-spectrum management ensures effective use of the EMS, preventing interference with military and civilian frequencies.
- *Rules of engagement.* EA usually has rules of engagement that must be followed to avoid violating international treaties that control the use of the EMS. In peacetime, EA is generally used only to protect friendly forces. In wartime or conflict, there are restrictions concerning the impact of EA on civilian emergency services.

Note. At the SFODA/SFODB level, leaders must coordinate with the SOTF IO planner for an effect in the EMS. The IO planner will coordinate with the EW officer to identify the means to achieve the effect. It is imperative that EA be coordinated and deconflicted with higher and adjacent elements. The frequency range on the EMS or the cell tower that needs to be jammed for an operation may be the primary means of communications or intelligence collection for friendly forces.

COMPUTER NETWORK OPERATIONS

2-45. CNO provide IO planners with the ability to affect information content and flow within cyberspace. The three elements of CNO are computer network attack, computer network defense (CND), and computer network exploitation. A computer network attack is the use of computer networks to disrupt, deny, degrade, or destroy information resident in computers and computer networks, or the computers and networks themselves. CND is the use of computer networks to protect, monitor, analyze, detect, and respond to unauthorized activity within Department of Defense information systems and computer networks. Information technology professionals assigned to the command, control, communications, and computer systems directorate of a joint staff (J-6); assistant chief of staff, command, control, communications, and computer systems staff section (G-6); command, control, communications, and computer systems staff officer (S-6); and specialized organizations typically execute CMD. Often these same personnel conduct IA activities. Computer network exploitation is an enabling operation and intelligence collection capability conducted by using computer networks to gather data from target or adversary automated information systems or networks. IO planners strive to integrate these CNO elements in cyberspace while synchronizing and coordinating them with other IO capabilities to ultimately achieve information superiority. CNO is typically a collective effort involving separate Services and interagency organizations seeking to achieve effects across the globally interdependent network of information technology infrastructures that include the Internet, telecommunications networks, computer systems, and embedded processors and controllers.

Note. Other than CND, which is executed by the J-6/G-6/S-6, CNO is not conducted at the JSOTF. If a need for CNO arises, the IO planner at the JSOTF will request support through appropriate channels. It requires a long lead time for the approval process**.**

2-46. Although CNO has a unique request process involving the joint operations planning process and classified supplemental processes, successful CNO planning relies on a five-step process (Figure 2-7, page 2-17) that should be integrated into the unit's planning process.

1. **Identify CNO contributions to the information operation and determine targets.** IO planners should refrain from identifying specific tasks to CNO and should focus on the desired effect for CNO in support of the information operation. This can be achieved by reviewing the previously determined IO objectives and identifying which objectives can be supported by CNO in terms of the effect included in the objective. Once the objectives to be supported are identified, IO planners coordinate with J-2/G-2/S-2 to identify potential targets for CNO. Related planning factors for a typical computer network attack include the—
   - Quality of available intelligence.
   - Reliability of access to the targeted network.
   - Level of risk determined through a collateral-effects estimate.
   - Timely availability of a required capability.

   IO planners should include CNO-related activities when developing measures of effectiveness (MOEs) associated with the IO objectives and identify collection methods for MOEs associated with CNO.
2. **Determine time available.** During this step, IO planners determine if there is time available to employ CNO in support of the information operation. Considerations include approval timelines, required timing and execution of other IO capabilities in regard to shaping the information environment, and whether delayed or disapproved CNO integration will substantially affect specific IO capability efforts or IO's overall contribution to the mission.
3. **Obtain approval.** Although CNO is an operational-level planning function, units at the tactical level should not hesitate to request CNO support if they identify an appropriate use. The request for CNO is a request for national-level assets. The CNO approval process has unique complexities. CNO-related authorities are retained at high echelons, and IO planners should plan accordingly. When completing CNO requests, IO planners should clearly show the necessity for CNO and its impact on mission accomplishment. IO planners at the tactical level should contact operational-level IO planners to submit CNO requests. Operational-level planners should handle the somewhat-formal approval process. One significant factor pertaining to approval is the fact that computer network exploitation has two distinct subelements. The first is that of an intelligence function (collection) and the second is that of an operations activity (enabling). This distinction is important because CNO, by doctrinal definition, does not include the intelligence subelement of computer network exploitation. However, under Title 10, United States Code, CNO can conduct similar activities as long as they are not for the purposes of intelligence collection. The intelligence community, operating under Title 50, United States Code, can conduct both subelements of computer network exploitation. Therefore, to ensure all activities are legal, coordination between these communities is usually required prior to approval.
4. **Execute CNO tasks.** Execution of CNO should be monitored by the unit to ensure synchronization with other IO capabilities as well as unit maneuver elements. IO planners should identify collected CNO-associated MOEs and make recommendations to the commander concerning variations to the plan.
5. **Conduct after-action review.** Upon completion of the operation, IO planners should determine if CNO tasks supported the IO objectives, as planned. IO planners should identify additional CNO tasks that may have increased friendly-force advantage. IO planners also review the request for CNO and determine what information would have expedited the request. They determine if all MOEs were able to be collected. If not, they determine what changes should be made for future operations? Finally, IO planners determine how the unit will handle unexpected CNO-related adversary responses in the future.

Figure 2-7. Five-step computer network operations planning process

COMBAT CAMERA

2-47. JP 1-02 defines COMCAM as *the acquisition and utilization of still and motion imagery in support of operational and planning requirements across the range of military operations and during joint exercises.*

No, We Did Not

In the spring of 2009, Iraqi Security Forces conducted an operation in central Iraq with U.S. SF advisors to capture an insurgent leader. During the course of the operation, sensitive-site exploitation information led the FID partner-force to a second location. The Iraqi Security Force with U.S. SF advisors searched the second location and then departed. Following the operation, the government of Iraq received complaints that property had been damaged and personnel were harmed during the search.

Due to the IO planning for the operation, COMCAM accompanied the assault force and provided crucial footage proving that no damage was caused to the facility and personnel were treated with respect. The footage was reviewed and released by higher HQ to refute the accusations.

2-48. COMCAM documents military operations with both video and still photography. When the mission dictates, it is used to—

- *Gather intelligence.* COMCAM provides imagery of potential targets or target areas and supports battle-damage assessments.
- *Support planning efforts.* COMCAM validates assumptions by providing accurate images of a situation.
- *Provide imagery to PA and other IO capabilities.* COMCAM provides graphics, photography, video products, and print media to enhance the effectiveness of PA press releases and MISO products.

  Document interrogations and autopsies. COMCAM provides evidence of proper techniques and procedures.
- *Support landing zone studies.* COMCAM imagery can help determine the diameter of the area and the terrain's grade.
- *Provide historical documentation.* COMCAM provides evidence of events for future use (for example, Red Cross investigations) and preserves the accuracy of historically significant events.

2-49. COMCAM captures a photographic record of military operations but, more importantly, it allows commanders to provide visual proof of operations for MISO and PA and to counter adversary IO for enemy, adversary, and neutral information activities. Once the COMCAM team's captured imagery or video is released by the supported commander, the imagery is digitally transmitted to the noncommissioned officer in charge of the JSOTF. Prior to sending the product to the joint combat camera center (JCCC), the imagery is reviewed to obtain the commander's release approval. Once approved, the image is sent to the JCCC, where it may be used by any Department of Defense entity that has access to the imagery database. For example, MIS elements may use these pictures to develop products, whereas PA will use these pictures during press conferences and media-engagement activities. At the tactical level, units can use these images to make immediate impact on the populace within the operating area by producing visual products highlighting local events, good or bad, to achieve the goals set by the unit commander. The complete cycle from image acquisition to receipt by the JCCC must occur within 24 hours for the collection imagery to remain a viable decisionmaking tool for national-level leaders.

2-50. The method of documentation depends on the purpose of the mission, the environment in which the documentation occurs, and the support available to the Soldiers documenting the event. There are three different COMCAM documentation methods:

- *Still photography.* Still photography involves producing, processing, and reproducing still-picture films, prints, and transparencies. These images can be captured using film or digital cameras or can be taken from motion picture or video photography. COMCAM teams use digital still-video cameras to capture and transmit images electronically. Some cameras also have night-vision devices that permit them to be used during darkness or other limited-light conditions.

- *Motion media.* Motion media is documentation of activities or operations as they occur. Motion media technology can be used in daytime, nighttime, and limited-visibility operations. The film, which captures positive and negative images, must be edited before IO or other staff elements can effectively use it.
- *Multimedia presentations.* Multimedia products can be used for a variety of purposes, from meeting training requirements to serving as a means to transmit public information. They allow commanders to review the operations and training of their forces, and introduce new and improved operational techniques and developments to subordinates.

2-51. COMCAM imagery must be reviewed by appropriate staff members of the supported command prior to release. The supported commander is the release authority for all collected COMCAM images before they are transmitted out of theater. Composition of the review board should be tailored based on the specific unit design. A typical review board includes the following individuals:

- J-2/G-2/S-2 representative (for identification of possible intelligence and exposure of classified information).
- OPSEC officer (for identification of possible disclosure of unit critical information [EEFI]).
- Judge Advocate General (for identification of possible or perceived violations of the laws of land warfare).
- Operations directorate of a joint staff (J-3)/assistant chief of staff, operations staff section (G-3)/operations staff officer (S-3) representative (for identification of exposed TTP or any content that is not desirable for release).
- PAO (for public-release consideration).

2-52. To maximize COMCAM support, leaders should—

- Employ COMCAM as an operational asset assigned to the J-3/G-3/S-3. A COMCAM representative is identified within the J-3/G-3/S-3 to plan for the employment of COMCAM.
- Plan to employ COMCAM during the initial phases of an operation to ensure comprehensive mission documentation.
- Provide COMCAM with full mission access (as is reasonably and tactically feasible) during each phase of the operation.
- Ensure COMCAM coverage availability before, during, and after operations.
- Ensure tasks to COMCAM personnel include clearly defined requirements and priorities. Include a purpose for each task to take advantage of COMCAM personnel initiative.
- Ensure COMCAM imagery is reviewed by PAO prior to release outside of the organization.
- Ensure COMCAM personnel provide imagery to the JCCC for immediate distribution to support strategic and operational objectives.

Note. COMCAM can provide images for MISO, MILDEC, PA, and CMO. It can be used for battle damage MOEs. It can also serve as a record.

LOCAL POPULACE AND KEY-LEADER ENGAGEMENTS

> *The people…represent many things in [a] conflict—an audience, an actor, and a source of leverage—but above all, they are the objective. The population can also be a source of strength and intelligence and provide resistance to the insurgency. Alternatively, they can often change sides and provide tacit or real support to the insurgents. Communities make deliberate choices to resist, support, or allow insurgent influence.*
>
> General Stanley A. McChrystal

2-53. Engagement of the local populace and key leaders is an important part of any counterinsurgency campaign or operation. Effective communication with key leaders and key communicators can be critical to mission success at all levels. Not only do commanders and senior leaders conduct key-leader

engagements, but every Soldier has the potential to conduct some form of engagement with the local populace and leaders, and most importantly, to communicate a message through their actions.

2-54. Military leaders who prepare, listen well, and communicate effectively are more likely to gain the cooperation and trust of the local populace. Commanders must also understand that influencing a given populace will most certainly require committing assets to help meet the people's needs—talk will only go so far. People associate actions with messages. SFODA actions on the objective must support the command's themes and messages. Messages with few or no supporting actions generally are given little credibility.

2-55. The attached MIS element is the most capable, by purpose, training, and organization, to develop, plan, monitor, and assess a commander's key-leader engagement strategy. As key-leader engagement is targeted to influence an action or nonaction, it falls to the MIS element to develop the appropriate messages to be disseminated to the appropriate target audience at the right time as part of the commander's larger influence efforts. By using attached MISO personnel to manage the KLE program, a commander ensures a broader, more effective influence effort in his AO.

TYPES OF ENGAGEMENTS

2-56. In interacting with the local population, there are well-planned and coordinated meetings and chance encounters, as described below:

- *Planned face-to-face meetings.* These meetings are daily or weekly key tactical-leadership activities that occur with local leaders and populace. Planned face-to-face engagements are well thought out and resourced. They are an important facet of the mission during counterinsurgency. Face-to-face meetings are often the result of the targeting process and support specific effects tied to accomplishing the desired end state.
- *Key-leader engagements.* These meetings are at all levels between military leaders, HN government, and tribal or village leaders to achieve or support a specific desired effect. To match the appropriate military leader with the leader being engaged requires careful planning.
- *Chance encounters and contacts.* Chance encounters typically occur with the local populace during patrols and other mission activities by MIS teams, Civil Affairs teams, and SFODAs. All personnel with access to the local populace and leadership should be briefed on how to conduct face-to-face engagements, be aware of current matters of interest to the local populace, and be knowledgeable of the command's themes and messages.

THEMES AND MESSAGES

2-57. Themes and messages are two distinct entities. Each has its own purpose—they are not interchangeable. Themes are usually associated with specific lines of operations and are planning tools that guide the development of messages and other information tools (for example, talking points, MISO print and broadcast products, and PA guidance). Themes represent the broad idea the commander wants to get into the mind of the target audience. Themes are not communicated to the target audience; that is the role of messages. Themes are broad and enduring.

2-58. Messages support themes and are communicated by speech, writing, or signals. They contain the information that will be delivered to the target audience. Messages are tailored to specific audiences and are meant to elicit or prevent a certain behavior. Messages constantly change with the situation and mission. Sources of messages include the following:

- *Command information messages.* These messages convey the policies and intent of local commanders to their subordinates. The PAO develops command information messages.
- *Public information messages.* These messages convey information to local target audiences through news, public-service information, and announcements from HN officials. The PAO develops public information messages.
- *MISO messages.* These messages convey specific information to selected foreign audiences to influence their attitudes, perceptions, beliefs, and behavior. MIS elements develop these messages.

Page 2953 of 3957

TYPES OF MESSAGES

2-59. Messages may be either negative or positive. Negative messages are used to attack the target audience or to convey the likelihood of negative consequences if the target audience does not engage in the desired behavior (for example, if you do not surrender, you will be killed). Positive messaging offers specific or implied benefits if the target audience engages in a certain behavior (for example, cooperation with coalition forces will result in the construction of a health clinic).

Note. By doctrine, there are no IO themes and messages. MISO and PA have themes and messages. If needed, in coordination with MISO and PA representatives, the IO staff may have to develop command themes and messages.

MESSAGE DEVELOPMENT

2-60. When developing messages, it is important that message content addresses target-audience vulnerabilities (or perhaps an interest or motivation). Target-audience vulnerabilities are determined by considering the following four factors:

- *Motives.* Look for factors that drive target-audience behavior. Primary motives include basic life needs such as shelter, security, and food. Secondary motives evolve from social interaction within the family, clan, or tribe, or from membership in political and religious organizations.
- *Demographics.* Look for target-audience characteristics, such as gender, ethnicity, religion, and age. Planners must determine which characteristics can be exploited to affect target-audience behavior.
- *Psychographics.* Look for the target audience's cognitive characteristics relevant to the world around them, both near and far. These can be values, beliefs, attitudes, and ideology that trigger emotional responses.
- *Symbols.* Symbols are a sophisticated mix of graphics, video, audio, or audiovisual objects that reference architecture, religious symbols, historical events, and symbols with cultural or contextual significance to the target audience.

2-61. Once vulnerabilities are identified, messages are crafted that communicate the approved themes to the target audience and address its vulnerabilities. Crafting messages is an art that requires time and thought. Figure 2-8, page 2-22, provides a sample message. A few guidelines to follow include—

- Limit each message to one thought.
- Keep each message succinct. Complex messages pose challenges for senders, translators, and receivers. Limit each message to one sentence and minimize internal sentence punctuation.
- Keep messages to a manageable number. Rule of thumb is no more than five messages per theme or target audience.
- Tailor messages for the means and method of delivery and the target audience.
- Convey a story (the theme) by arranging the messages from first to last. The sum of the messages should then tell the story (or theme).
- Place the bottom line up front and summarize at the end. The first message should contain the most important thought. The last message should restate the first message.
- Consider developing "escape" messages that leaders and Soldiers can use to deflect conversations away from the themes to avoid.

Themes	*Messages*
It is inevitable that the insurgents will be defeated.	• While your leaders sleep safe in their warm beds, you are left to suffer in the cold and wind. • Your mothers will mourn the deaths of their sons, and your children will be orphans when you meet the bloody death that awaits you. • Lay down your weapons and return home to the families who need you.
The Army is honorable and capable.	• The Army is the guardian of the people. • The Soldiers fight like bold lions for the freedom of the nation. • The enemy comes with foreigners in the night to murder and rob their fellow tribesmen. • Help the Army defeat its enemies and provide information about terrorists, weapons, people, and activities.
The insurgents are responsible for civilian deaths.	• The United States and its allies do everything possible to avoid civilian deaths. • The insurgents hide among the populace. • It is well known that the terrorists place women and children in harm's way when it suits their purposes.

Figure 2-8. Example message (paired to themes)

2-62. The tool that can be used to develop and organize themes and messages is a message development matrix (Figure 2-9).

Target Audience	*Target Audience Vulnerability*	*Desired Target Audience Action(s)*	*Themes*	*Messages*
People in Village X.	Security from villagers in Town Y.	Halt violent demonstrations.	Violence does not solve any problems.	• Violence does not improve your situation. • Further violence will lead to the withdrawal of coalition aid and support.

Figure 2-9. Example message development matrix

PREPARING FOR A FACE-TO-FACE MEETING

2-63. Conducting planned and unplanned engagements with the local populace and their leaders requires preparation to be effective. Time spent researching the target, anticipating requests and issues, and rehearsing the meeting often pays high dividends. Units conducting operations among the local populace should assume engagements will occur and prepare for them prior to the mission. Lack of preparation may lead to embarrassing situations that have the potential to diminish the effectiveness of friendly forces and create an advantage for the adversary.

2-64. Leaders should consider the following, when preparing for a key-leader engagement or planned meeting:

- *Identify upcoming meeting.* Meetings may occur because of—
  - *A recurring schedule.* Unit leaders often have schedules for reoccurring meetings, such as weekly city council meetings or occasional sit-downs with elected officials, clan or familial

leaders, or tribal sheikhs. These meetings present a preplanned opportunity to conduct a key-leader engagement.

- *Direction from higher HQ.* A higher HQ may direct a unit to engage a specific leader or group to support its objectives. Units should incorporate higher HQ directions into the existing schedule of meetings.
- *Mission planning.* During mission planning, key-leader engagements may be identified as part of the operation. These engagements may have to be conducted outside the normal schedule of meetings.
- *Requests from local leaders.* Local leaders sometimes seek a meeting to address specific concerns or emergencies. When arranging these meetings, always consider the importance of pairing the right military leader with the right civilian leader. Leaders should be very cautious about giving access to relatively insignificant or noninfluential civilian leaders who may try to gain access to senior military leaders.

Note. After identifying a meeting, leaders should determine an appropriate location for the meeting. If hosting the event, leaders ensure the area is presentable and cleared of any operational information. They ensure the location is quiet and away from disturbances such as phones or radios.

- *Identify target-audience characteristics.* Gather as much information about the local leader as possible (for example, proper name and title, approximate age, family members, ethnicity, language spoken, and relationships to other leaders, friendly forces, third-party organizations, and the adversary). One way to obtain this information and prepare for a meeting is to consult personnel who have met with the person before. It is important to continually refine and update background information based on experience with the individual. Characteristics of the local leader that are good to know include—
  - *Language spoken.* Identifying the leader's language may be difficult if multiple languages and dialects are spoken in the operational area, all of which could require different interpreters.
  - *Education/literacy level.* Level of education may determine which form of the language the local leader speaks. Many languages have a colloquial version and a more formal textbook version (often referred to as high or formal). Knowing the individual's level of literacy may impact on decisions to leave written products during the meeting.
  - *Customs and etiquette.* Identifying unique customs and proper etiquette prevents awkward moments during the meeting.
  - *Attitudes.* Understanding the local leader's attitudes toward military forces and toward other organizations and groups in the AO helps to avoid a tense discussion. Plan a strategy to overcome the leader's negative perceptions.
  - *Key advisors.* Knowing the local leader's key advisors facilitates follow-on discussions and may bridge gaps that cannot be resolved with the target directly. Advisors are also helpful in gauging the leader's perceptions of U.S. forces and of the results of the meeting.
- *Identify target-audience concerns.* Every individual engaged has some key concerns that may be raised during the meeting. Being prepared to address these concerns will greatly facilitate communication. Some of the local leader's concerns may include—
  - *Local conditions.* Religious, public health, crime, and economic issues in the key leader's AO may impact the dialogue during the engagement.
  - *Needs.* The local leader will probably discuss the needs of his followers. Needs can be the basic requirements of food, water, and shelter, or they can be more complex—political power-sharing, contact between the populace and U.S. forces, or getting help with reconstruction or security matters. Anticipating the leader's concerns allows the U.S. leader to plan resources that can enhance cooperation.

  - *Religious, political, and economic viewpoints.* Conditions in the operating area may shape religious, political, and economic viewpoints, but viewpoints vary depending on the individual. Knowing the local leader's viewpoints makes it easier to address or avoid sensitive topics that may detract from the meeting. This does not mean that these topics should be avoided, but in general it is best to avoid sensitive topics until one is more familiar with the target audience.
- *Review previous meetings.* Notes, comments, and debriefings from previous meetings with the key leader may indentify previous agreements made with the local leader and reoccurring topics that are likely to be raised at the meeting. For example, if during previous meetings with a city mayor, the mayor asked for more money at each meeting, chances are that he will ask for money again.
- *Identify end state.* Typically, the engagement's end state is the action (or, at times, the inaction) friendly forces want the target to take. For example, the unit may want a leader to actively support Army recruiting or a religious leader to stop encouraging violence.
- *Develop messages.* Develop tailored messages that support the engagement's end state and address the key leader's vulnerabilities. When possible, use already approved messages. Review MISO themes to stress and avoid.
- *War-game responses and reactions.* Develop appropriate counteractions to the key leader's most likely responses and possible demands.
- *Develop meeting exit strategy.* Have an exit strategy so the meeting can end tactfully.

2-65. Leaders can use a face-to-face engagement work sheet (Figure 2-10, page 2-25) to plan critical aspects of key-leader engagements. When kept current, the work sheets are a useful planning tool for future engagements with the same target. Commanders and leaders should also rely heavily on assigned or appropriate themes and messages for reinforcement during the engagement. MIS forces habitually do target audience analyses on various individuals, groups, and factions within their assigned AO and are skilled at planning operations to influence.

CONDUCTING A FACE-TO-FACE ENGAGEMENT

2-66. The following guidelines can help ensure a productive engagement. The spokesman should—

- Position himself immediately next to the engaged key leader and designate a second person to be a recorder.
- Establish rapport with the target audience. The spokesman uses a greeting phrase in the native language, when possible. The spokesman arranges for seating and offers something to drink for the meeting.
- Introduce everyone in the party and record the names and positions of everyone in attendance.
- Avoid rushing through the meeting. The spokesman plans for enough time to accommodate the culture and avoids making the target audience feel they are low on the priority list. The spokesman is prepared for small talk before discussing business. He takes cues from the target audience.
- Ask permission to take photos of the target audience.
- Apologize in advance for any cultural mistakes made. The spokesman assures the target audience that he does not mean to offend and asks that the target audience identify any mistakes made. The spokesman is careful about telling jokes; they can backfire when translated.
- Avoid restricted topics and confrontational attitudes.
- Never assume that the target audience does not speak or understand English.
- Always maintain eye contact with the person he is speaking with, not the translator. The translator is his voice. The spokesman communicates through the translator, not to him. He watches the target audience's gestures, eyes, and body language, not those of the translator.
- Speak in short clips. He should not recite a long paragraph and expect the translator to accurately convey the message. The target audience should feel like he is being conversed with, not being lectured to. He should remember that one to two sentences at a time is a good rule.
- Avoid using acronyms, slang, and idioms. He should keep the language simple.

- Treat all members of the target audience with courtesy and respect.
- Avoid making or implying promises that cannot be kept.
- Avoid elevating his position or embellishing his authority. Although he certainly may have to check with higher authorities before making promises or decisions, using it as an excuse too often may decrease the target audience's respect for him as a leader.
- Use open-ended questions to facilitate discussion. Yes or no answers tend to be incomplete and inaccurate.
- Be aware of the body language from all parties. He ensures that the body language does not negate the message.
- Recap what has been said, as the meeting closes, and clarify expected actions by both parties.

<table>
<tr><td>Target:

Intended target is John Smith.</td><td>Date-Time Group:

210900DEC11</td><td>Location:

FOB Bragg, Building 2, Room 123</td></tr>
<tr><td colspan="3">Characteristics:

Records from previous meetings indicate John Smith is a stern tribal leader. Research shows him to be supportive of U.S. interests, but he has been known to support operations against U.S. forces when it benefits him personally. A number of Smith's acquaintances verify this information. Meeting will be limited to one hour.</td></tr>
<tr><td colspan="2">Environment and Concerns:

Meeting at FOB Bragg is a friendly environment. Our goal is to provide assurance to Smith that the United States will support him upon his return to the tribal region.</td><td>Previous Meetings:

Previous meetings have been cordial and show Smith appears to support U.S. interests. Smith has indicated a desire to partner with U.S. forces in the tribal region.</td></tr>
<tr><td colspan="2">Desired End State:

Reconfirm to Smith that the United States will continue to support his tribe by providing a detachment to support training against insurgency.</td><td>Themes/Messages:

The message Smith must receive is that the United States will continue to provide support for training and combat operations. Posters and pamphlets clarifying this support will be provided to Smith upon his departure.</td></tr>
<tr><td colspan="2">Anticipated Reaction/Issues:

Smith's reaction should be positive provided he is affirmed of continued U.S. support for his tribe. As an issue, it is anticipated that Smith will request monetary compensation for the families of wounded and killed tribal members.</td><td>Response:

Previous meetings indicate that Smith is a hard negotiator, and will initially request more than the United States is prepared to offer. Negotiators must remain steadfast in limiting promised support to that which is deemed appropriate.</td></tr>
<tr><td colspan="2">Meeting Strategy:

Meeting rehearsal is scheduled for 200900DEC11. The team leader and team sergeant will negotiate on behalf of the United States. Participants should be firm, but respectful. Negotiation will occur with Smith only. Samples of products will be provided. Promises of support must remain in keeping with commander's guidance.</td><td>Exit Strategy:

Time limit for the meeting is set at 1 hour. The code word DISCONTENT will be used to end the meeting.</td></tr>
<tr><td colspan="3">Attendees:

Scheduled attendees include John Smith, his aide (Michael Jones), the team leader, team sergeant, and intelligence sergeant. The intelligence sergeant will maintain a list of additional attendees, including approximate age, home town, contact information, profession, and demeanor.</td></tr>
<tr><td colspan="3">Notes:

Team will conduct after-action review immediately following the meeting to compare notes and ensure an accurate understanding. Final report will be submitted to Colonel Jackson not later than 220900DEC11.</td></tr>
<tr><td colspan="2">Follow-up Actions:

Meeting notes and after-action report will be provided to all detachments in the area. Any required coordination with higher will occur within 10 days of the conclusion of the meeting.</td><td>Next Meeting:

Next meeting is scheduled for 200900JAN12.</td></tr>
</table>

Figure 2-10. Example of a face-to-face engagement work sheet

CHANCE ENCOUNTERS AND CONTACTS

2-67. During a chance encounter or contact with the target audience, the leader of the unit should conduct the face-to-face engagement based upon a preplanned battle drill, to include:

- *Security.* Protect both friendly troops and the target audience.
- *Time.* Limit the length of the engagement. Establish a codeword for when it is time to end the meeting.
- *Identify the local leader.* Ask who is in charge and talk to him. Otherwise, select a maximum one or two people to talk with. Do not distribute anything to the populace without the local leader's permission.
- *Take notes.* Get names of all people contacted, approximate ages, hometowns, businesses or activities, subjects covered, demeanor toward friendly forces, and any particular concerns of the target audience.
- *Establish rapport.* Offer the target audience refreshment (such as a bottle of water) and move to a comfortable location. Sit if possible.
- *Focus.* Stay on message by communicating the command's messages.
- *Report.* Report contacts with local leaders up the chain of command to ensure that an accurate picture of the situation is developed.

WORKING WITH TRANSLATORS

2-68. Translators should be treated as a part of the unit. The better the translator is integrated into the unit, the better the translator's performance. Leaders must ensure translators are used for translation duties only. Using them for other activities may violate their contract. An example of misemployment is using a translator to run errands in town. However, sending the translator to town to coordinate a meeting for a U.S. official is allowed. A good rule of thumb is if the translator is acting as the leader's official voice, the action is legal.

2-69. Leaders must know each translator's strengths and weaknesses. The lives of Soldiers may be in the translator's hands. Translators should speak in first-person, remain nearby during engagements with the populace or key leaders, carry a notepad and take notes, project clearly, and mirror the leader's vocal stresses and overall tone.

2-70. The translator should be allowed rest periods to collect his thoughts. Meal meetings are especially challenging for a translator. Leaders should allow the translator to eat during or after the meeting.

2-71. Leaders must rehearse with the translator. If a translator performs poorly, it affects the target audience's perceptions of friendly forces. Rehearsals verify the translator's abilities, help identify words the translator may not know, and ensure the translator understands the overall message to be conveyed. This is especially important with complex, new, or sensitive issues.

2-72. The translator should be briefed on expected behavior. Leaders must recognize that translators are often seen as a representative of the command. All aspects of translator behavior must be kept professional and ethical, regardless of nationality or ethnicity. If operational details are briefed to the translator during the mission rehearsal, leaders should consider having the translator remain on the base camp until execution. Also, the translator should not have a cellular telephone or other communication device.

2-73. When using a translator, a leader must always maintain eye contact with his counterpart and not the translator. The leader communicates *through* the translator—not *to* the translator. The target audience should be observed for changes in gestures, postures, and body language. Leaders should speak in short clips—it is difficult to recite a long paragraph and expect the translator to accurately convey the intent.

COUNTERING ADVERSARY INFORMATION ACTIVITIES

2-74. Countering adversary information consists of programs of products and actions designed to nullify information for effect, misinformation, disinformation, and propaganda or to mitigate the effects of the

information. Successful operations to counter adversary information require the use of all IO and other capabilities.

2-75. All elements of IO can and will support the operations to counter adversary information plans, but the focal point for such operations should remain with PA forces. *Adversary information* is used to describe information and activities used by an adversary or enemy, in peacetime and wartime, to undermine the legitimacy of operations and the credibility of the force. Previously the term *propaganda* was used to describe all forms of adversary information. The evolution of media forms and capabilities has made the term propaganda too limiting in describing how information is used by adversary states and nonstate actors to gain an advantage in the global information environment. To better clarify the use and application of adversary information this manual divides adversary information into the following four categories:

- *Information for effect.* Information for effect involves the use, publication, or broadcast of factual information to negatively affect perceptions and/or damage credibility and capability of the targeted group. Examples of uses of information for effect involve the premature announcement of collateral damage caused by friendly forces, reporting or images of the results of insurgent attacks on friendly forces, or release of captured sensitive, or classified information.
- *Propaganda.* Any form of adversary communication, especially of a biased or misleading nature, designed to influence the opinions, emotions, attitudes, or behavior of any group in order to benefit the sponsor, either directly or indirectly (JP 1-02).
- *Misinformation.* Incorrect information from any source that is released for unknown reasons or to solicit a response or interest from a nonpolitical or nonmilitary target (FM 3-13).
- *Disinformation.* Information disseminated primarily by intelligence organizations or other covert agencies designed to distort information or deceive or influence U.S. decisionmaker, U.S. forces, coalition allies, key actors, or individuals via indirect or unconventional means (FM 3-13).

Countering Adversary Information in Iraq

In the early part of 2009, U.S. forces were beginning to transfer bases to Iraqi Security Force control. During the planning of the transfer, a vulnerability was identified that enabled insurgent groups to exploit information and claim they had driven U.S. forces out of the bases. In the north, the Islamic State of Iraq propaganda efforts were active and could exploit upcoming transfers.

The SFODA identified Islamic State of Iraq activity in the vicinity of a future base transfer. The SFODA, in concert with the SOTF, developed a plan with conventional forces to counter Islamic State of Iraq propaganda and highlight the upcoming transfer to Iraqi Security Forces using multiple information capabilities, to include key-leader engagement, PA, PSYOP, and Iraqi Security Force engagement of media. This aggressive information operation with significant Psychological Operations support informed the population of the purpose for the base transfer, countered Islamic State of Iraq propaganda, and discredited Islamic State of Iraq in the area.

2-76. For the purposes of IO, adversary information justifies actions and bolsters legitimacy of an adversary. By communicating with the populace and, at times, friendly forces, the adversary offers a window into its philosophy, goals, objectives, and operations. Therefore, adversary information may provide a useful insight into how to defeat the adversary. Some of the more commonly used techniques include the following:

- *Name-calling.* This describes the use of a name or word to connect a person to something negative (for example, Muslim extremists describing or terming Westerners as Crusaders).
- *Glittering generalities.* This describes the twisting of the meaning of a word that has great symbolic value (for example, terming terrorist attacks as a jihad).
- *Euphemisms.* This describes the use of a milder word to make a situation seem less threatening (for example, “revenue enhancement” to describe a tax hike).

- *Transfer.* This describes the use of symbols to associate an agenda with a respected institution (for example, placing official letterhead on a piece of disinformation).
- *Testimonial.* Testimonials add credibility to a position (for example, using celebrities to testify on political issues).
- *Bandwagon.* This describes a technique which plays on the desire of people to fit in (for example, 7 of 10 workers prefer candidate X).
- *Fear.* This describes the manipulating of people's fears to elicit a behavior (for example, without jihad, the crusaders will invade your homes).

2-77. To effectively counter adversary information, it is necessary to understand the environment in which the adversary information exists. One way to establish the context of adversary information is to determine the interrelationship between information indigenous to the operational area and the culture and history of the people. This information is often available in the MISO studies and appendixes to the command's operation plan. Furthermore, it is also necessary to identify adversary information from other forms of information in the operating environment. Adversary information is often subtle and nuanced, and may be mixed in with misinformation and disinformation. To separate propaganda, it is necessary to identify adversary capabilities to develop and spread propaganda, as well as the receptiveness of the target audience to the adversary's lines of persuasion. This is typically a MISO task, conducted using the source-content-audience-media-effects analysis technique for individual pieces or instances of opponent propaganda and series analysis to determine the operational impact. Source-content-audience-media-effects analysis requires thorough analysis and resources normally found with the MIS elements at the JSOTF level. IO planners can facilitate this analysis by assisting intelligence and MIS personnel in the collection of suspected propaganda. A simple description of source-content-audience-media-effects is as follows:

- *Source.* Identify the originator or sponsor of the propaganda.
- *Content.* Identify the line(s) of persuasion used (the message and the source's desired effect).
- *Audience.* Identify the audiences targeted by the source and actually reached by the propaganda. This step is critical to countering adversary IO planning.
- *Media.* Identify the medium used and why that particular medium was selected by the source.
- *Effects.* Determine the impact of the opponent's propaganda on the target audience. Try to determine whether the propaganda has caused attitudinal or behavioral change.

2-78. A possible staff solution to the problem of countering adversary information activities is to form a working group of personnel from the IO, MISO, PA, and intelligence staffs who can fuse propaganda analysis and media analysis with the current intelligence estimate. In general, the working group seeks to determine how the adversary affects the content and flow of information in the operating environment, how propaganda impacts the various target audiences, and what audience needs are being targeted by the propaganda.

2-79. Countering adversary information activities does not commence upon discovery of adversary propaganda. Effective operations to counter adversary information activities proactively seek to mitigate propaganda's effects before their onset.

2-80. Countering adversary information activities is a long-term operation. To mitigate or nullify the effects of adversary propaganda, countermeasures must anticipate the adversary's response. Success of this effort rests with the ability to correctly direct the capabilities at affecting specific information to the target audience. An effective operation to counter adversary information efforts selects the appropriate capabilities and determines how these capabilities can be employed to match or overmatch the effects of opponent propaganda. Common techniques to counter adversary information include the following:

- *Forestalling.* Forestalling counters possible lines of persuasion prior to the release of propaganda.
- *Conditioning.* Conditioning preemptively shapes target audience vulnerabilities prior to exposure to propaganda.
- *Restrictive measures.* Restrictive measures deny the intended target audience access to the propaganda.
- *Direct refutation.* Direct refutation rebuts the propaganda point-for-point.

- *Indirect refutation.* Indirect refutation questions the validity of some aspect of the opponent's argument.
- *Diversion.* Diversion diverts attention by presenting more important or relevant themes to the target audience.
- *Imitative deception.* Imitative deception alters the propaganda to degrade its impact.
- *Silence.* Silence offers no response to the propaganda.
- *Minimization.* Minimization acknowledges selected elements of the propaganda while downplaying the importance of the content.

2-81. It is unlikely that any one set of countermeasures will apply a complete solution. The effects of opponent propaganda and friendly countermeasures will likely develop in a nonlinear fashion; hence, a constant process of analysis and application is necessary. It is unlikely that any one set of countermeasures will apply a complete solution. The effects of opponent propaganda and friendly countermeasures will likely develop in a nonlinear fashion; hence, a constant process of analysis and application is necessary. To do this, IO planners must monitor any effects produced by the countermeasures, changes to the operating and information environments, and adversary responses to the countermeasures. Then, if applicable, IO planners reengage the target audiences with new countermeasures. Although there is no doctrinal methodology for countering propaganda, the following steps can be used:

- *Analyze target audiences.* Understand the environment, the operational area, the inhabitants, the culture, and the adversary.
- *Analyze propaganda.* Establish a collection plan to identify and collect adversary propaganda. Use the source-content-audience-media-effects process to analyze.
- *Analyze media affecting the environment.* Identify media in AO and then determine its bias and use by adversary for propaganda purposes.
- *Apply countering adversary information measures.* Compare the propaganda analysis to the various capabilities and countering adversary information techniques and then apply appropriate countermeasures.
- *Monitor.* Evaluate the effects of the countering adversary information measures.

REWARDS PROGRAMS

2-82. The Department of Defense Rewards Program pays rewards to persons for providing USG personnel with information or nonlethal assistance that is beneficial to—

- An operation or activity of the Armed Forces or of allied forces participating in a combined operation with allied forces conducted outside of the United States against international terrorism.
- Force protection of the Armed Forces or allied forces participating in a combined operation with U.S. Armed Forces.

2-83. There are two types of Department of Defense rewards:

- Preapproved rewards allow a geographic combatant commander to nominate individuals or items to be placed on the Secretary of Defense preapproved rewards list for rewards in amounts that are in excess of the authority delegated to combatant commanders.
- Regular rewards paid to individuals providing the information after the target has been prosecuted and a monetary value established.

2-84. The Department of Defense Rewards Program can be used for information leading to the killing or capture of high-value individuals, the recovery of weapons caches, or information of impending attack on U.S. forces. Rewards can be paid in monetary funds or barter items. It cannot be used for weapons buyback programs, running an intelligence program, paying intelligence-source salaries, deceased persons (for example, an assassination program), or paying for illegal drugs (for example, a poppy, heroin, or cocaine buying program).

2-85. Rewards programs can be a potent asset to IO used to shape the information environment and provide a conduit to pass messages to the populace and the adversary. Examples of how rewards can be used for the purposes of IO include the following:

- *Key-leader engagement.* Rewards can be used as a means to establish working relationships and build influence with key leaders who have influence in their communities. Rewards can be used to bolster a key leader's position in their community.
- *Influence local population.* Rewards can be used to convince the local populace they can help control the local security situation. They can receive cash rewards for turning in weapon caches and insurgents that cause insecurity in their communities.
- *Message insurgent leaders and fighters.* Rewards can be used to send messages that affect adversary perceptions and decisionmaking. Placing a preapproved reward on a mid-level insurgent leader and then saturating his operating area with wanted posters and handbills may curtail his ability to move and conduct operations.
- *Rewards as part of deception*. Deceptive information about rewards can be used to conceal friendly TTP. Messages can be disseminated that insurgents are being captured because they are being turned in for rewards and not by friendly collection assets. The success of the reward program can be highlighted through MISO products, key-leader engagements, and the "rumor-mill."
- *Rewards as a divisive tool.* As rewards are paid to individuals concurrent with the kill or capture of high-value individuals, friction can be created within an enemy network as members consider who may be leaking information, intentionally or unintentionally, that places the network at risk.

CIVIL-MILITARY OPERATIONS

2-86. CMO establish, maintain, influence, or exploit relations between military forces, governmental and nongovernmental civil organizations, and the local populace. CMO contribute to shaping the operational area by focusing on civil aspects of the mission, their impact on military operations, and the impact of military operations on the civilian populace. A supportive civilian population can provide resources and information that facilitate friendly operations. As is the case with PA, CMO rely heavily on credibility with local leaders and the populace. CA forces are the designated forces and units organized, trained, and equipped to support the commander in planning and conducting CMO.

2-87. CA forces are structured to support JSOTF operations at the strategic, operational, and tactical levels while maintaining regional focus. The concept of CA support to the JSOTF is that a CA battalion (minus) with two CA companies supports the JSOTF. The CA battalion CA planning team is collocated with the JSOTF HQ to assist in CMO planning within the joint special operations area. A CA company HQ will be collocated with each SOTF and is capable of providing a civil-military operations center (CMOC) outside of each SOTF. A CA team is designated to support each SF advance operational base, as directed. The remaining CA teams are designated as a surge capability for the SOTF commander.

2-88. The CMOC is a standing capability formed by all CA units. The CMOC serves as the primary coordination interface for the U.S. armed forces and indigenous populations and institutions, humanitarian organizations, intergovernmental organizations, nongovernmental organizations, multinational military forces, and other civilian agencies of the USG. The CMOC facilitates continuous coordination among the key participants with regard to CMO and CAO from local levels to international levels within a given operational area, and develops, manages, and analyzes the civil inputs to the common operational picture. The CMOC center is the operations and support element of the CA unit as well as a mechanism for the coordination of CMO.

2-89. CA teams are typically four-Soldier elements consisting of a team leader, team sergeant, engineer, and medic. Besides planning, coordinating, and supporting civil reconstruction projects, CA teams can conduct medical civilian action programs, veterinary civilian action programs, and humanitarian assistance missions to provide quick-impact contributions to local populace quality of life. A CA teams' performance in a given area can affect the public perception in the local area. MISO can support these with radio broadcasts and other means to advertise the events and later exploit their success. PA can also exploit the success of these missions through press releases. It may be useful to attach COMCAM to a CA team to

document civil contributions or to provide photographs for intelligence analysis. If COMCAM assets are not available, any available Soldier with knowledge of the command's intent for the photographs may take pictures.

2-90. If friendly-force military operations create collateral damage and casualties among the populace, CA teams may conduct consequence management to mitigate the negative impact of such operations on the populace through payments or other types of reimbursement. The unit's CA officer may be a conduit to a provincial reconstruction team or other similar entities that have developed relationships with local leaders.

PUBLIC AFFAIRS

2-91. PA units provide timely and accurate information so that both U.S. and international audiences may assess and understand the facts concerning military operations. PA units have the following responsibilities:

- *Internal.* PA provides command information to inform the force and counter effects of adversary propaganda and misinformation.
- *External.* PA provides information regarding military operations to external agencies, governments, media, and populaces.

2-92. Although PA personnel strive to be separate from IO, there is no denying the impact of timely, relevant PA press releases on a given audience. This impact can be multiplied substantially and used to support command objectives when PA personnel are included in IO planning and able to prepare consequence-management activities by preparing press releases beforehand.

2-93. Adversary forces may review PA release information to cue intelligence and provide battle damage assessments. Additionally, PA may be an information conduit to adversary decisionmakers. Extreme care should be taken when employing PA, as successful and effective public relations depends on credibility, and credibility relies on truthful reporting. PA can support IO by—

- Getting ahead of enemy propaganda with the truth.
- Countering adversary misinformation and disinformation by publishing accurate information.
- Ensuring media awareness of the implications of premature release of certain information.
- Playing a key role in establishing ground rules for embedded reporters.

2-94. MISO and PA are separate capabilities that support the commander's objectives. Coordination must be conducted between both. For IO planners, it is important to understand that rural populations generally do not have access to PA release material. Further, PA is wholly dependent on local, regional, and international media to carry their messages. These rural and isolated groups are best informed through MIS assets, which do have organic production and dissemination capabilities. IO planners can facilitate this by ensuring PA releases and articles are sent to MISO planners for dissemination to the local populace. PA planners should review and deconflict messaging with MISO planners to ensure that tactical, operational, and strategic messages are mutually supporting or, at the very least, not contradictory.

Note. The best way to influence the populace through themes and messages is to use the most influential people in the area—the key communicators. Local leaders, FID partner forces, and religious leaders are just some examples of the types of personnel who can spread the message amongst the populace. Whoever is viewed as the most influential, trustworthy source (key is credibility of the messenger) should be the individual serving as a conduit to the target audience.

DEFENSE SUPPORT TO PUBLIC DIPLOMACY

2-95. DSPD are those activities and measures taken by Department of Defense components to support and facilitate public diplomacy efforts of the USG. DSPD is a key military role in supporting the USG's strategic communication program. It includes peacetime military engagement activities conducted as part of the combatant commanders' theater security cooperation plans.

2-96. The focus of defense support to the public diplomacy is to understand, engage, influence, and inform critical foreign audiences through words and actions to foster understanding of U.S. policy and advance U.S. interests. The decisions and actions executed by the SFODA on the ground can have a profound effect on U.S. public diplomacy efforts.

2-97. Figure 2-11, pages 2-32 through 2-35, and Figure 2-12, pages 2-36 through 2-38, provide an overview of IO capabilities. Figure 2-13, pages 2-39 and 2-40, outlines the support roles of IO, CMO, and PA.

OPSEC Supports By:	
MILDEC	• Concealing competing observables. • Degrading general situation information to enhance effect of observables. • Limiting information and indicators that could compromise military deception operations.
MISO	• Concealing contradicting indicators while conveying selected information and indicators. • Ensuring products do not contain classified information.
Physical Destruction	• Concealing friendly delivery systems from enemy offensive IO until it is too late for the adversary to react. • Denying information to the enemy on the success of offensive IO.
EW	• Concealing EW units and systems to deny information on extent of EA and EW support capabilities.
Physical Security	• Concealing EEFI. • Reducing the activities requiring physical security. • Hiding tools of physical security, thus preventing adversary from gaining access.
IA	• Concealing physical and electronic information system locations.
CI	• Ensuring EEFI are concealed from enemy collection assets.
Computer Network Attack (CNA)	• Concealing CNA capabilities.
CND	• Denying enemy knowledge about CND capabilities.
MILDEC Supports By:	
OPSEC	• Influencing adversary not to collect against protected units/activities. • Causing adversary to underestimate friendly operations security capabilities.
MISO	• Providing information compatible with MISO theme.
Physical Destruction	• Influencing adversary to underestimate friendly physical-destruction capabilities. • Influencing adversary to defend C2 element/systems that friendly forces do not plan to destroy.
EW	• Influencing adversary to underestimate friendly EA and EW support capabilities.
Physical Security	• Masking troop activities requiring safeguards.
IA	• Overloading adversary intelligence and analysis capabilities. • Protecting and defending friendly information systems.
CI	• Giving the adversary a cover story so his intelligence system collects irrelevant information.
CNA	• Providing MILDEC targets and deception stories to enhance CNA.

Figure 2-11. Mutual support within information operations capabilities

MILDEC Supports By (continued):	
CND	• Causing the enemy to believe U.S. CND defense is greater than it actually is. • Causing the enemy to believe all CND tools are in place.
MISO Supports By:	
OPSEC	• Disseminating rules of engagement. • Assisting in the countering of propaganda and misinformation. • Minimizing resistance and interference by local population.
MILDEC	• Creating perceptions and attitudes that MILDEC can exploit. • Integrating MISO actions with MILDEC. • Reinforcing the deception story with information from other sources.
Physical Destruction	• Causing populace to leave targeted areas to reduce collateral damage.
EW	• Broadcasting MISO products into adversary civilian and military frequencies. • Developing messages for broadcast on other service EW assets.
Physical Security	• Targeting adversary audiences to reduce the need for physical security.
IA	• Enhancing the ability of IA in the minds of the enemy.
CI	• Providing messages in enemy decisionmaker's mind that can be revealed by CI to determine enemy true intentions.
CNA	• Convincing enemy to not do something by describing effects of a CNA if they take undesirable actions. • Providing MISO messages for dissemination by CNA means.
CND	• Providing information about nonmilitary threat to computers in the AO.
Physical Destruction Supports By:	
OPSEC	• Preventing or degrading adversary reconnaissance and surveillance.
MILDEC	• Conducting physical attacks as deception events.
MISO	• Degrading adversary's ability to see, report, and process information. • Isolating target audience from information.
EW	• Destroying adversary C2 targets.
Physical Security	• Reducing physical security needs by attacking adversary systems able to penetrate information systems.
IA	• Attacking adversary systems capable of influencing friendly information systems availability and integrity.
CI	• Destroying appropriately nominated adversary collection assets.
CNA	• Supplementing computer network attack by destroying or degrading hard targets.
CND	• Destroying or degrading enemy CNA facilities before they attack friendly computers.
EW Supports By:	
OPSEC	• Degrading adversary electromagnetic intelligence, surveillance, and reconnaissance operations against protected units and activities. • Creating barrier of white noise to mask unit maneuvers.
MILDEC	• Using EA and EW support as deception measures. • Degrading adversary capabilities to see, report, and process competing observables causing the enemy to misinterpret information received by electronic means.

Figure 2-11. Mutual support within information operations capabilities (continued)

EW Supports By (continued):	
MISO	• Degrading adversary's ability to see, report, and process information. • Isolating target audience from information and herding that target audience onto MISO broadcast frequencies.
Physical Destruction	• Providing target acquisition through EW support.
Physical Security	• Using electronic protection to safeguard communications used in protecting facilities.
IA	• Using electronic protection to protect equipment.
CI	• None.
CNA	• Supplementing CNA with EA.
CND	• Using electronic protection to protect personnel, facilities, and equipment.
Physical Security Supports By:	
OPSEC	• Protecting operation plans and operation orders.
MILDEC	• Restricting access by level of security and number of personnel.
MISO	• Protecting inventory of sensitive products to prevent premature dissemination of messages.
Physical Destruction	• Safeguarding availability of information systems to use in physical destruction.
EW	• Safeguarding equipment used in electronic warfare.
IA	• Safeguarding information systems by implementing security procedures.
CI	• Safeguarding personnel, and preventing unauthorized access to equipment, installation, materiel, and documents.
CNA	• Safeguarding information systems from sabotage, espionage, damage, or theft.
CND	• Determining applicable risk and threat levels.
IA Supports By:	
OPSEC	• Ensuring information system confidentiality.
MILDEC	• Providing information system assets for conducting MILDEC operations.
MISO	• Ensuring availability of information systems for MISO.
Physical Destruction	• Ensuring information systems are available for physical destruction tasks.
EW	• Ensuring EW assets are available.
Physical Security	• Providing for information system authentication.
CI	• Ensuring information systems are available to conduct CI.
CNA	• Ensuring links with higher HQ to pass CNA.
CND	• Taking actions to ensure availability, integrity, authentication, confidentiality and nonrepudiation of computer.
CI Supports By:	
OPSEC	• Countering foreign human-intelligence operations.
MILDEC	• Countering foreign human-intelligence operations. • Identifying threat intelligence, surveillance, and reconnaissance capabilities.
MISO	• None

Figure 2-11. Mutual support within information operations capabilities (continued)

Page 2967 of 3957

CI Supports By (continued):	
Physical Destruction	• None.
EW	• Providing electronic countermeasures. • Conducting countersignal operations to allow broadcast of MISO messages.
Physical Security	• Countering foreign human-intelligence operations.
IA	• At certain echelons, helping ensure information integrity.
CNA	• Confirming results of CNA.
CND	• Detecting, identifying, assessing, countering, and neutralizing enemy intelligence collection.
CNA Supports By:	
OPSEC	• Attacking enemy computers before they can detect U.S. EEFI.
MILDEC	• Providing the deception story through computers.
MISO	• None.
Physical Destruction	• Attacking selected targets by nonlethal means, which allows lethal attacks on other targets.
EW	• Using with EA.
Physical Security	• Conducting risk assessment to determine consequence of second- and third-order computer network attack effects.
IA	• Attacking enemy computers before the enemy attacks friendly computers.
CI	• Exploiting enemy intelligence collection.
CND	• Attacking the enemy's ability to attack friendly computers.
CND Supports By:	
OPSEC	• Detecting enemy attempts to acquire information.
MILDEC	• Protecting the MILDEC plan resident inside computers.
MISO	• Preventing the compromise of MISO message before release.
Physical Destruction	• Protecting fire support C2 systems.
EW	• Using in conjunction with electronic protection.
Physical Security	• Erecting firewalls to protect intrusion into networks.
IA	• Supporting information assurance of information passed via computer networks.
CI	• Detecting, identifying, and assessing enemy collection efforts against computers.
CNA	• Protecting CNA weapons from enemy detection.

Figure 2-11. Mutual support within information operations capabilities (continued)

OPSEC Can Conflict By:	
MILDEC	• Limiting information that can be revealed to enhance deception story credibility.
MISO	• Limiting information that can be revealed to develop MISO messages.
Physical Destruction	• Limiting information that can be revealed to enemy to develop targets.
EW	• Electronic protection and operations security may have different goals.
Physical Security	• Should be no conflict.
IA	• Should be no conflict.
CI:	• Should be no conflict.
CNA	• Should be no conflict.
CND	• Should be no conflict.
MILDEC Can Conflict By:	
OPSEC	• Revealing information OPSEC normally seeks to conceal.
MISO	• Limiting MISO theme selection. • Limiting information that can be revealed to develop military information themes. • Undermining the credibility of overt messages and other MISO efforts.
Physical Destruction	• Limiting targeting to allow survival and conduct of critical adversary C2 functions.
EW	• Limiting EA targeting of adversary information systems to allow survival and conduct of critical adversary C2 functions.
Physical Security	• Negating the deception story by physical security preventing transmission of a realistic deception story.
IA	• Presenting data the enemy will believe versus assuring data is not revealing to enemy.
CI	• Giving the adversary a cover story that inadvertently supports his collection plan.
CNA	• Should be no conflict.
CND	• Should be no conflict.
MISO Can Conflict By:	
OPSEC	• Revealing information OPSEC normally seeks to conceal.
MILDEC	• Limiting deception story selection if deception story contains untruths.
Physical Destruction	• Limiting targeting of adversary C2 infrastructure to allow conveying of MISO messages.
EW	• Limiting EA against adversary communications frequencies to allow MISO messages to be conveyed.
Physical Security	• Should be no conflict.
IA	• Should be no conflict.
CI	• Should be no conflict.
CNA	• Should be no conflict.
CND	• Should be no conflict.

Figure 2-12. Potential conflicts within information operations capabilities

Physical Destruction Can Conflict By:	
OPSEC	• Causing firing systems to reveal their locations.
MILDEC	• Limiting selection of deception means by denying or degrading elements of adversary C2I command infrastructure necessary to process deception story.
MISO	• Limiting means available to convey MISO messages by denying or degrading adversary C2 systems and civilian communications infrastructure.
EW	• Limiting opportunities for communications intrusion by denying or degrading elements of adversary information systems.
Physical Security	• Limiting access to targeting data (consider need to know).
IA	• Attacking incorrect adversary systems capable of influencing friendly information system availability and integrity.
CI	• Destroying insufficient number of adversary collection assets.
CNA	• Should be no conflict.
CND	• Should be no conflict.
EW Can Conflict By:	
OPSEC	• Revealing EW assets prematurely.
MILDEC	• Limiting selection of deception measures by denying or degrading use of adversary C2 systems.
MISO	• Reducing frequencies available to convey MISO messages. • Jamming military and commercial frequencies used by MISO for electronic dissemination.
Physical Destruction	• Limiting targeting of adversary C2 systems.
Physical Security	• Revealing what physical security is trying to protect (EA). • Electronic protection should not conflict.
IA	• Should be no conflict.
CI	• Should be no conflict.
CNA	• Should be no conflict.
CND	• Should be no conflict.
IA Can Conflict By:	
OPSEC	• Should be no conflict.
MILDEC	• Reinforcing the deception story.
MISO	• Should be no conflict.
Physical Destruction	• Should be no conflict.
EW	• Deconflicting electronic protection and information assurance.
Physical Security	• Should be no conflict.
CI	• Having insufficient information systems available to conduct CI.
CNA	• Having no available links with higher HQ to pass CNA requests.
CND	• Should be no conflict.

Figure 2-12. Potential conflicts within information operations capabilities (continued)

CI Can Conflict By:	
OPSEC	• Should be no conflict.
MILDEC	• Should be no conflict.
MISO	• Should be no conflict.
Physical Destruction	• Killing sources.
EW	• Needing EW support for other activities.
Physical Security	• Should be no conflict.
IA	• Negating information integrity with ineffective CI.
CNA	• Should be no conflict.
CND	• Revealing CI on how networks are protected.
CNA Can Conflict By:	
OPSEC	• Attacking selected enemy targets may provide information on friendly activities.
MILDEC	• Resulting in attacks on wrong target if coordination is not made with MILDEC.
MISO	• Preventing the enemy from receiving MISO messages.
Physical Destruction	• Attacking same target with nonlethal and lethal weapons wastes both time and ammunition.
EW	• Needing to deconflict which systems attack which targets.
Physical Security	• Revealing computer network attack sources that should be protected.
IA	• Should be no conflict.
CI	• Attacking enemy computers before exploiting hostile intelligence collection efforts.
CND	• Should be no conflict.
CND Can Conflict By:	
OPSEC	• Should be no conflict.
MILDEC	• Reinforcing the deception story.
MISO	• Should be no conflict.
Physical Destruction	• Should be no conflict.
EW	• Should be no conflict.
Physical Security	• Should be no conflict.
IA	• Should be no conflict.
CI	• Should be no conflict.
CNA	• Should be no conflict.

Figure 2-12. Potential conflicts within information operations capabilities (continued)

IO Supported By:	
CMO	• Influencing informing populace of civil-military activities and support. • Neutralizing misinformation and hostile propaganda directed against civil authorities. • Controlling electromagnetic spectrum for legitimate purposes.
PA	• Countering adversary information and protecting from misinformation/rumor. • Developing EEFI to preclude inadvertent public disclosure. • Synchronizing MISO and OPSEC with PA strategy.
DSPD	• Ensuring accuracy of information. • Maintaining relevance of information. • Timeliness of information. • Usability of information. • Completeness of information. • Security of information.
COMCAM	• Coordinating guidance to COMCAM teams with commander's information/objectives. • Assisting in expeditious transmission of critical COMCAM images.
CMO Supported By:	
IO	• Providing information to support friendly knowledge of information environment. • Synchronizing communications media and assets and messages with other information capabilities. • Coordinating C2 target sets with targeting cell. • Establishing and maintaining liaison or dialogue with indigenous personnel and nongovernmental organization. • Supporting MISO with feedback on MISO themes. • Providing news and information to the local people.
PA	• Providing information on CMOC activities to support PA strategy. • Synchronizing communications, media, and message. • Identifying, coordinating, and integrating media, public information, and HN support.
DSPD	• Providing information to inform interagency elements on local information environment. • Synchronizing communications media and messages with other IO capabilities. • Establishing and maintaining liaison or dialogue with indigenous personnel and nongovernmental organizations. • Supporting DSPD with feedback on strategic communications themes.
COMCAM	• Using COMCAM capabilities to record priority civic action projects. • Synchronizing imagery assignments with COMCAM team leader.
PA Supported By:	
IO	• Coordinating with IO planners to ensure a consistent message and maintain OPSEC. • Supporting counter adversary information. • Providing assessment of effects of media coverage to OPSEC planners. • Providing assessment of essential nonmedia coverage of deceptions story.

Figure 2-13. Support roles of information operations, civil-military operations, public affairs, defense support to public diplomacy, and combat camera

PA Supported By (continued):	
CMO	• Providing accurate, timely, and balanced information for the public. • Coordinating with civil affairs specialist to verify facts and validity of information.
DSPD	• Coordinating with interagency planners to ensure a consistent message. • Proving assessment of media coverage.
COMCAM	• Managing release of key images through PA channels. • Coordinating for COCAM coverage and access to key events and operation.
DSPD Supported By:	
IO	• Providing a link to interagency for coordination and guidance on strategic communications themes and activities.
CMO	• Providing a link to interagency for coordination and guidance on strategic communications themes and activities.
PA	• Providing a link to interagency for coordination and guidance on strategic communications themes and activities.
COMCAM	• Providing a link to interagency for coordination and guidance on strategic communications themes and activities.
COMCAM Supported By:	
IO	• Providing responsive imagery coverage of events in the operational area.
CMO	• Providing responsive imagery coverage of events in the operational area.
PA	• Providing responsive imagery coverage of events in the operational area.
DSPD	• Providing responsive imagery coverage of events in the operational area.

Figure 2-13. Support roles of information operations, civil-military operations, public affairs, defense support to public diplomacy, and combat camera (continued)

Page 2973 of 3957

Chapter 3

Planning Information Operations

IO are planned as part of the planning process, whether it is the military decisionmaking process, the joint planning process, or some abbreviated planning method. However, in comparison with planning other operations, there are two noticeable differences:

- A longer lead time is required for planning IO. Many IO capabilities have time requirements for preparation (notably MILDEC, MISO, and CNO).
- The threat of hostile information from outside the operational area is great. The ease of information flow through information networks and the media means that operating boundaries are porous to outside influences.

The focus of mission planning for IO is to gain information superiority. Information superiority is an operational advantage derived from the ability to collect, process, and disseminate an uninterrupted flow of information while exploiting or denying an adversary's ability to do the same. Because absolute information superiority is rarely possible to gain or maintain, IO should seek information superiority at or before the operation's decisive point. If the operation is phased, it may be necessary to achieve a form of information superiority in each phase. If the operation is not phased, planners may determine that operational advantages are needed before, during, and after the operation.

Successful IO Plan

The primary role of the IO planner is to coordinate, synchronize, and deconflict while ensuring the appropriate capabilities are employed based on the desired effect. An example of this is an information operation that took place in the Basra Province of Iraq in 2009.

The mission was to conduct an information operation with and through the HN forces to bolster popular support for a partner unit and decrease the influence of extremist groups in the province to set conditions for a safe and secure environment.

The concept was broken down into three phases and focused on four information capabilities: PSYOP, PA, COMCAM, and CMO. The first phase was education and training; the focus of this phase was to provide the partner unit with training on how to interact properly with the populace and the media. The PSYOP teams took the lead during this phase by providing information team training based on various approved courses. This was also an assessment phase for the PAO and the CA officer on the partner unit's media relations and CMO capabilities. In addition to conducting assessments, the PAO, in cooperation with COMCAM, published numerous press releases highlighting the successes of the partner unit's direct action missions. The second phase was planned engagements; the focus of this phase was to assist the partnered unit with providing the locals with much-needed supplies and materials. The CA planner took the lead during this phase by working with the SFODA to determine the best areas to deliver goods and in which areas the SFODA wanted to increase their influence. (*continued)*

Page 2974 of 3957

The PAO and COMCAM supported this phase by highlighting the engagements via press releases and photos. They also utilized a broadcaster to gather video footage of the successful engagements. Based on the relationships developed during phase two, the SFODA transitioned to phase three—planned operations. The SFODA used the information gathered during the planned engagements to assist with targeting efforts, and focused on decreasing the influence of the insurgent groups in the region.

By incorporating multiple capabilities of IO into a focused, coordinated effort, the plan achieved the desired effects to bolster popular support for a partner unit and decrease the influence of extremist groups in the province.

THE STAFF ESTIMATE FOR INFORMATION OPERATIONS

3-1. The staff estimate is an assessment of the situation and an analysis of the COAs a commander is considering. It includes an evaluation of how factors in a staff section's functional area influence each COA or assigned mission, and includes conclusions and recommendations. Staff estimates are developed as part of the planning process. These estimates normally are text documents; however, they may be formatted as maps, graphics, or charts. Whatever form they take, the estimate should be as comprehensive as possible without becoming overly time-consuming.

3-2. The staff estimate for IO is an estimate focused on the information environment and the use of information by adversary and friendly forces. It assesses the situation in the information environment and analyzes the best way to achieve information superiority for the assigned mission.

3-3. Staff sections, particularly at the tactical level, rarely have the time to complete all five paragraphs of a formal doctrinal estimate. In that case, the estimate should concentrate on situation assessment rather than COA development, and only paragraphs 1 and 2 need be produced and updated as operations progress.

3-4. Figure 3-1, page 3-3, provides a format for an IO staff estimate. Figure 3-2, page 3-4, provides an example of a graphic IO estimate.

PLANNING CONSIDERATIONS DURING MISSION ANALYSIS

3-5. The purpose of mission analysis for IO is to assist planners in seeing the information environment, the adversary, and friendly forces in the context of the assigned mission. At the end of mission analysis, IO personnel should have—

- The intelligence preparation of the operational environment (IPOE) products, such as a combined information overlay (CIO) and a template of adversary operations in the information environment.
- The essential tasks for IO.
- The capabilities in the information environment.
- The constraints for IO.
- The critical information requirements for IO.
- The EEFI.

ESSENTIAL TASKS FOR INFORMATION OPERATIONS

3-6. Units rarely conduct an information operation autonomously. There will always be higher HQ and tasks. Although some tasks may have been specifically assigned by the higher HQ, others may be implied (meaning they are necessary to accomplish specified tasks or the overall mission). Implied tasks should require resources and not be administrative in nature. From the specified and implied tasks, planners should identify tasks that the command must successfully accomplish to affect adversary and friendly use of information. These are the unit's essential tasks for IO.

1. **MISSION.** The unit mission.
2. **SITUATION AND CONSIDERATIONS.**
   - **a. Characteristics of the Information Environment.** Summarize significant characteristics of the information environment and the impact on military operations.
     - **(1)** Subinformation environments. How terrain and weather, populace, civilian information infrastructure, civilian population, third-party organizations, and other physical and cognitive features of the information environment create subinformation environments.
     - **(2)** Information nodes. Identify what places, persons, or infrastructure in each subinformation environment shape information contact and flow by creating or transmitting information.
   - **b. Adversary Forces.** Adversary capabilities, vulnerabilities, and activities in the information environment.
   - **c. Friendly Forces.**
     - **(1)** Friendly COA. IO concept of support for each COA.
     - **(2)** Current status of resources. The availability of organic IO capabilities and assets (as translated into capabilities to operate in the information environment).
     - **(3)** Current status of other resources. The availability of supporting IO capabilities and assets from higher HQ, other commands, agencies, and organizations.
     - **(4)** Friendly-force vulnerabilities in the information environment.
     - **(5)** Comparison of requirements versus capabilities and recommenced solutions.
     - **(6)** Key considerations (evaluation criteria) for COA supportability.
   - **d.** Assumptions. Assumptions for IO developed during mission analysis.
3. **COURSES OF ACTION.**
   - **a.** List the COAs that were war-gamed.
   - **b.** List evaluation criteria identified during COA analysis.
4. **COA ANALYSIS.** Analyze each COA using the evaluation criteria. Estimate the likelihood of accomplishing the IO objectives given the available time and capabilities. Determine the potential for unintended consequences of IO tasks and the possible impacts on friendly and adversary forces' COAs.
5. **COMPARISON.** Compare COAs using evaluation criteria. Rank-order COAs for each criterion. If possible use a decision matrix to support.
6. **CONCLUSIONS AND RECOMMENDATION.** Recommend COA based on the comparison (most supportable by IO). Identify IO issues, deficiencies, risks, and recommendations to reduce their impacts.

Figure 3-1. Information operations staff estimate

3-7. Typically, essential tasks for IO number between three and five. More than five essential tasks present the risk of overtaking subordinate elements or having an information operation that is too complex to execute.

3-8. One useful technique for validating an essential task is to ask the following question: "If the unit accomplishes all other tasks marginally and does this one well, will it accomplish the mission?" If the answer is "no," then the task is not essential. If more than five essential tasks are identified, planners should question the validity of each essential task or the nature of the requirements levied on the unit by higher HQ.

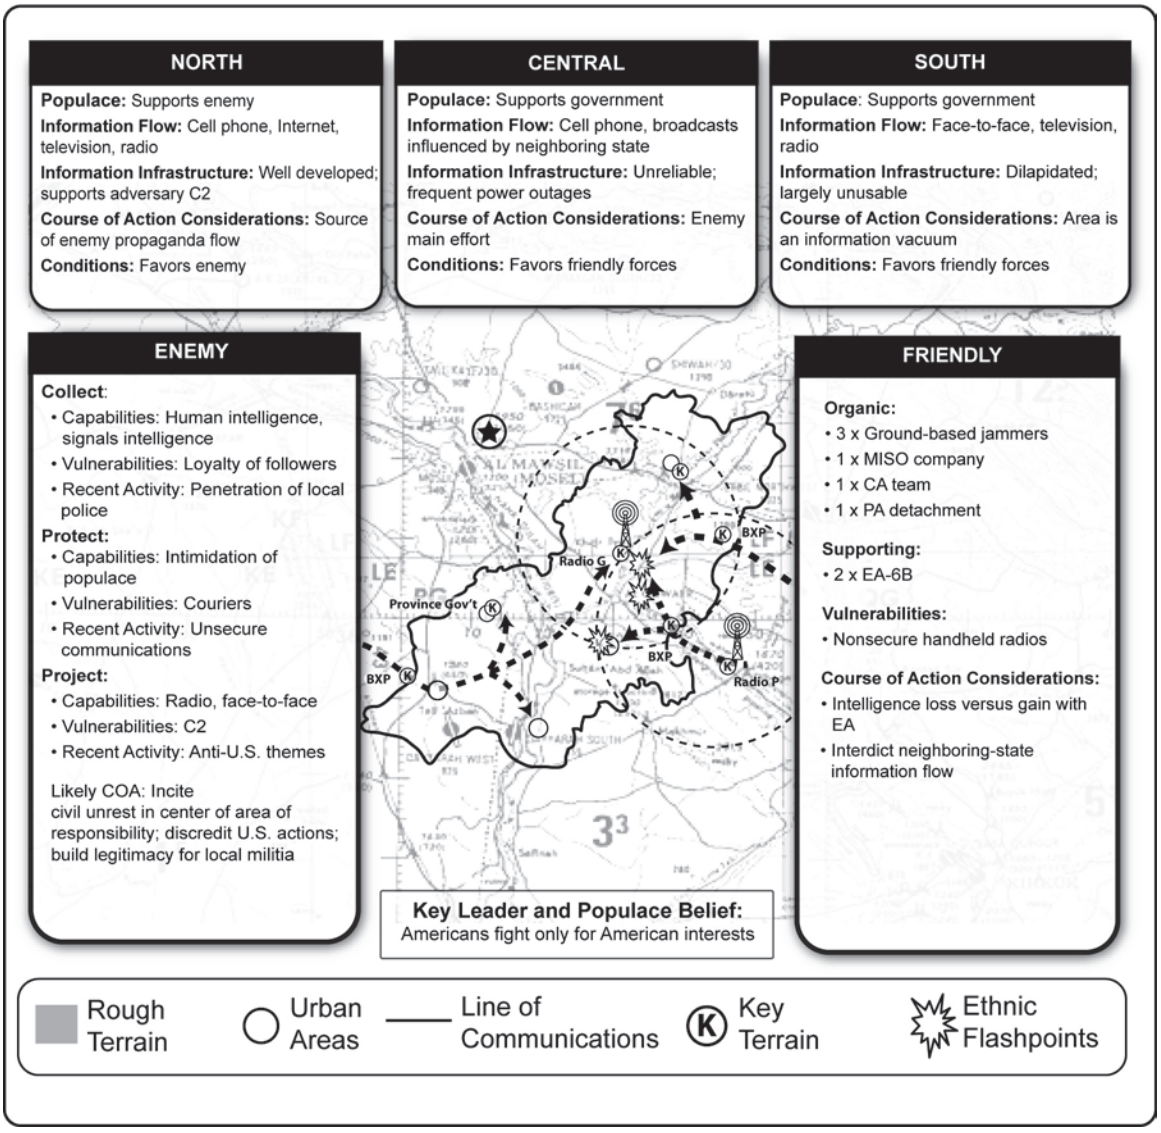

Figure 3-2. Example graphic information operations estimate

CAPABILITIES IN THE INFORMATION ENVIRONMENT

3-9. IO planners should determine if the command has the assets to perform assigned tasks. This is done by identifying any or all organic and supporting IO-capable assets. Organic assets are resident in assigned or attached forces. Supporting assets are available to the command from a higher HQ or government agency. Available assets are then compared with the IO mission requirements (specified and implied tasks) to identify capability shortfalls and any additional assets that are required. It is important to keep in mind that IO planners do not possess any of the individual IO capabilities; these assets all reside within the supporting elements. To ensure use of these assets, IO personnel must start coordination early.

3-10. IO planners face a challenge in expressing IO capabilities to the commander and staff. A simple list of IO capabilities (that is, three ground-based jammers, nine MIS teams, two COMCAM teams, and so on) does not help the commander visualize the command's capabilities in the information environment. In developing its staff estimate. IO planners should consider the following basic questions:

- What can the command do using organic assets?
- What can supporting assets from the higher HQ do?
- What can not be done?

3-11. One possible solution to this problem is to organize IO capabilities by elements, asset, and means in terms of their contributions to friendly-force operations in the information environment. Figure 3-3 shows a sample asset list.

Element	*Assets*	*Means*	*Supported Essential Tasks for IO*	*Effect*	*Targets*
MIS detachment	• 4 x MIS teams	• Loudspeaker operations • Handbills and posters • Radio and TV broadcasts • Face-to-face • Key-leader engagement	• Degrade adversary morale • Influence local populace to not interfere with friendly operations	• Degrade • Influence • Inform	• Insurgent cell • Local populace • Key leaders
SF detachment	• SF teams	• Direct action • Face-to-face	• Disrupt adversary C2 • Build legitimacy of HN security forces	• Disrupt • Destroy • Degrade • Influence	• Insurgent leaders • Insurgent cells • Local populace
EA	• 2 x EA-6B	• Jammer	• Disrupt adversary C2 • Degrade adversary morale	• Disrupt • Degrade • Isolate • Influence	• Insurgent leaders • Insurgent cells

Figure 3-3. Sample information operations asset list

CONSTRAINTS ON INFORMATION OPERATIONS

3-12. Constraints are restrictions placed on the command by a higher HQ that either require the use of resources to execute a specific task or prohibit the commander from taking specific actions. In either case, constraints reduce the commander's freedom of action.

3-13. Like most other operations, IO are constrained by rules of engagement, U.S. national policy, international politics, and other legal, moral, cultural, or operational factors. Additionally, IO planners should consider that IO capabilities have constraints of their own, particularly MILDEC, MISO, CNO, and EW. Common constraints include approval authority for deception operations, MISO themes to avoid, allied forces' national policies and capabilities, restricted targets and frequencies, and PAO guidance.

3-14. To enhance understanding, IO constraints are organized in terms of information content and flow, as shown in Figure 3-4, page 3-6.

Information Content	• Themes should avoid favoring any ethnic group. • Themes should stress highlighted cooperation. • During current operations, approval authority is delegated down to the JSOTF and brigade combat team commanders. • Joint task force commander approves deception.
Information Flow	• No cross-boundary EA. • All EA must be coordinated with the JSOTF. • Non-U.S. allies may not disseminate U.S. MISO products. • PA posture is passive. • Mosques are on the restricted-target list. • COMCAM priorities.

Figure 3-4. Example of information content and flow organization

CRITICAL INFORMATION REQUIREMENTS FOR INFORMATION OPERATIONS

3-15. Commander's critical information requirements (CCIRs) identify information needed by the commander to visualize the operational area and make critical decisions. CCIRs also filter information to the commander by defining what is important to mission accomplishment. If the information operation is important to the mission, then there should be IO input to the CCIR.

3-16. The staff nominates information requirements to become CCIRs based upon the commander's guidance, higher HQ CCIRs, the essential-task list, and the J-2/G-2/S-2 IPOE (situation template). There are two types of CCIRs—

- *Priority intelligence requirements (PIRs).* PIRs are information the commander must know about the adversary. For IO, PIRs should focus on conditions in the information environment and adversary actions that affect the information environment. PIRs that may be required for IO include the following:
  - What media outlets are producing or disseminating hostile propaganda?
  - What propaganda themes are being disseminated to the populace by adversary forces?
- *Friendly-force information requirements (FFIRs).* FFIRs are items of information the commander must know about the friendly force. For IO, FFIRs provide information on critical aspects of the command's information system, IO-capable assets, and execution of the information operation. FFIRs that may be required for IO include the following:
  - Death or serious injury of noncombatants by friendly forces.
  - Media coverage of alleged friendly-force misconduct.

ESSENTIAL ELEMENTS OF FRIENDLY INFORMATION

3-17. EEFI are the critical aspects of a friendly operation that—if known by the adversary—would subsequently compromise, lead to failure, or limit success of the operation, and therefore must be protected from detection. In other words, EEFI is a list of information that must be protected from the adversary's intelligence system to prevent the adversary from making timely decisions and allowing friendly forces to retain the initiative. Typically, EEFI include the command intentions, subordinate element status, or the location of critical assets (such as command posts and signal nodes). EEFI should be refined throughout the planning process, as some information may not be identified until COA development. Once EEFI are developed, specific measures (in the form of tasks to subordinate units) are developed to protect the information (OPSEC process). Two examples of EEFI are—

- Friendly forces' means of intelligence collection.
- Tribal leaders assisting friendly forces.

Note. Chapter 4 provides additional information on how to develop EEFI.

MISSION ANALYSIS WORK SHEET

3-18. A mission analysis work sheet (Figure 3-5) guides planners through the critical parts of mission analysis. The format to conduct a mission analysis brief to the commander is identical to the mission analysis brief format.

1. **Facts.** Statements of known data concerning the situation, including adversary and friendly disposition, available troops, unit strengths, and material readiness that will directly affect the mission.
2. **Assumptions.** Suppositions on the current or future situation assumed to be true in the absence of facts and which will typically describe future eventualities on which success of the operation depends.
3. **Tasks.**
   - a. **Specified.** Tasks specifically assigned to the command by higher HQ (extracted from paragraphs 1, 2, and 3 of the higher HQ base order, annexes, and overlays).
   - b. **Implied.** Tasks that must be performed to accomplish specified tasks of the overall mission (developed from an analysis of specified tasks).
   - c. **Essential.** Tasks that must be executed to accomplish the mission (derived from analyzing specified and implied tasks lists: essential tasks are included in the mission statement).
4. **Constraints.** Restrictions placed on the command by higher HQ that dictate an action or inaction, thus restricting the command's freedom of action (extracted from higher HQ guidance, concept of operations, coordinating instructions, and annexes—especially IO, rules of engagement, themes to avoid, CMO, and PA).
5. **Available Assets.** Organic and supporting troops and equipment available for the operations (derived from higher HQ order, current tasks organization, and unit status reports).
6. **Risk Assessment.** Hazards that may be encountered during the mission because of the presence of the adversary or hazardous condition in the AO (developed from staff experience and SOPs).
7. **CCIRs.** Information the commander needs to make critical decisions, especially to determine or validate COAs.
   - a. **PIR.** Information the commander must know about the adversary (derived from known gaps in information required to accomplish the operations).
   - b. **FFIRs.** Information the commander must know about the friendly force (developed form knowledge of the friendly force and mission).
8. **EEFI.** Critical aspects of the friendly operation that—if known by the adversary—will compromise, lead to failure, or limit success of the operation and, therefore, must be protected from detection (derived from higher HQ order and developed by using the OPSEC process).

Figure 3-5. Mission analysis work sheet

COURSE OF ACTION DEVELOPMENT

3-19. A COA is a possible plan to accomplish the assigned mission. The IO planner's goal is to develop a concept of support that will generate effects that create information superiority over the adversary at the proper time and place. An IO concept of support should be—

- *Suitable.* The concept must create information superiority over the adversary.
- *Feasible.* The COA must be practical in terms of time, space, and resources. Considerations include time available to shape the information environment and availability of IO capabilities.
- *Acceptable.* The command's information operation must consider the cost of resources, as well as the operational and accidental risks associated with the proposed concept.

- *Distinguishable.* Each COA should be supported with a unique information operation, although the differences may be subtle. These differences include the use of different IO capabilities, changes to the allocation of the capabilities, or changes in the time or sequence of IO tasks.
- *Complete.* The COA should provide information superiority and address friendly-force actions in the case of undesirable results.

3-20. Successful IO give subordinates maximum latitude for initiative and postures the unit for follow-on missions. Likewise, with a little foresight, IO planners can use one information operation to jump-start another. Occasionally, a tactical-level information operation may just be the perfect catalyst for an operational-level information operation (and so on).

STRENGTHS AND WEAKNESSES: INFORMATION ADVANTAGE

3-21. The first step in developing an IO concept of support is to determine whether friendly or adversary forces have the information advantage. A nondoctrinal term, *information advantage* means being in a superior position (able to operate better) in the information environment relative to one's opponent. Information advantage is relative, meaning that although two opposing forces are operating in the same information environment, how each force operates in the information environment is different.

3-22. To determine relative information advantages, leaders compare friendly and adversary forces' strengths (capabilities) and weaknesses (vulnerabilities) in the information environment. This analysis is an asymmetric evaluation, meaning that there will unlikely be a direct correlation between the assets used by either friendly or adversary forces, and how those forces employ the assets. Therefore, IO planners should attempt to relate similar capabilities and attributes in terms of how information is—

- *Collected.* Information collection describes how friendly and adversary forces' means and capabilities are used to collect information about the opponent. Leaders must consider capabilities in terms of HUMINT, SIGINT, imagery intelligence, measurement and signature intelligence (MASINT), and OSINT.
- *Protected.* Information protection describes friendly and adversary forces' means and capabilities to protect critical information and maintain means of communication.
- *Projected.* Information projection describes friendly and adversary forces' means and capabilities to put information into the operational area's information environment. Leaders must consider the type and number of information systems possessed by each side (for example, face-to-face, radio, or TV).

3-23. The adversary forces' capabilities and weaknesses can be derived from IPOE, whereas friendly-force capabilities come from mission analysis, and vulnerabilities from a center-of-gravity (COG) analysis of friendly forces. The results are compared to determine which side is at an advantage or disadvantage in each function. If no apparent advantage or disadvantage exists, then that aspect of operations in the information environment is neutral for both sides. The end result is a subjective determination of whether friendly or adversary forces have the overall advantage in the information environment, and in what way one side has the advantage. Once the analysis is concluded, IO planners should have insight into the following:

- The friendly forces' information capabilities needed for the operation.
- The friendly and adversary forces' vulnerabilities in the information environment.
- The type of operations in the information environment that may be possible from both the friendly and adversary forces' perspectives.
- The additional IO capabilities and resources required to execute the operation.
- The allocation of existing IO capabilities and resources.

The information advantage work sheet (Figure 3-6, page 3-9) is a tool for estimating information advantage.

Page 2981 of 3957

Capabilities in the Information Environment	Strength/Weakness		Relative Advantage	
	Enemy	Friendly	Enemy	Friendly
Information Collect	• OSINT • Couriers	• Overhead and night capabilities • HUMINT sources		X
Information Protect	• Centralized leadership • Unsecure communications	• Secure communications • Internet leaks	X	
Information Project	• Face-to-face • Inconsistent messages	• Radio broadcasts • Lack of credibility with populace	X	
Overall Information Advantage			X	

Figure 3-6. Information advantage work sheet

GENERATING INFORMATION SUPERIORITY

3-24. Once a thorough understanding of each side's capabilities and vulnerabilities is established and apparent advantages and disadvantages are determined, IO planners can begin generating options (COAs) to achieve information superiority.

3-25. Information superiority is an operational advantage derived from the ability to collect, process, and disseminate an uninterrupted flow of information while exploiting or denying an adversary's ability to do the same. Information superiority can be achieved by attacking the adversary force with information or shaping the information environment (or both). These attacks are directed at reducing any relative advantages the adversary has and exploiting its relative vulnerabilities in the information environment.

3-26. This duality of information operations—attacking the adversary and shaping the information environment—is analogous to fires and maneuver, where fires equate to attack of the adversary's ability to use information for C2 and as a weapon against friendly forces, and maneuver is an activity to seize and retain information nodes for the purpose of gaining a positional advantage in the information environment. To be effective, an information operation balances activities to attack the enemy force with those that shape the information environment. Through a combination of both, a military force seeks information superiority over the adversary. Figure 3-7 shows examples of information superiority.

Focus of IO	Cognitive Dimension	Physical Dimension
Adversary Force	• Slow decisionmaking • Reduce morale	• Misemployment of forces
Information Environment	• Change populace support	• Change populace behavior

Figure 3-7. Examples of information superiority

3-27. Once identified, information superiority becomes the purpose of the information operation, and as COAs are developed, they must be nested to the unit's main operation. To do this, IO planners determine the operational advantage (that is, information superiority) that will be sought in the information environment and ensure its purpose supports the purpose of the mission statement.

CONCEPT OF SUPPORT STATEMENTS AND SKETCHES

3-28. The IO concept of support describes how available forces will achieve information superiority. It states when and where information superiority needs to be achieved and describes how IO will support the operation and how IO capabilities will be employed. IO planners develop an IO concept of support for

each assigned mission or COA based on what the command's assets and resources can do to achieve the IO objectives. To build an IO concept of support, the IO planner develops the—

- Purpose of the information operation (information superiority).
- IO objectives or essential information operations tasks (EIOTs) that will create the effects in the information environment to achieve information superiority.
- Tasks to subordinate units and staff elements that assign specific actions that will achieve the IO objectives' desired effects.
- Target nominations. Certain IO tasks may result in the identification and nomination of targets.
- Request for support from higher HQ.
- Assessment plan to measure progress.

INFORMATION OPERATIONS OBJECTIVES

3-29. IO objectives describe the effects that will achieve information superiority. IO objectives do not stand alone, but support the commander's operational intent. As such, an IO objective is a statement of what IO will do to attack the adversary or shape the environment to achieve information superiority. For example, if information superiority for an operation is "prevent target from moving from Objective Black prior to attack," then IO objectives could be "disrupt adversary communications within Operational Area Blue to prevent early warning," "deceive adversary decisionmakers on Objective Black to prevent relocation of C2," or "influence local populace in Operational Area Blue to support friendly-force operations with preventing populace reporting of friendly-force activities."

3-30. For each mission or COA considered, IO planners develop IO objectives based on the tasks for IO identified during mission analysis. Depending upon the complexity or duration of the mission (for example, a tactical direct-action mission versus a long-term FID defense mission) there may be only one IO objective or there may be numerous IO objectives developed for each phase of the overall operation. Generally, regardless of the mission, no more than five objectives are planned for execution at any one time in the operation.

3-31. When possible, IO objectives should be observable (the desired effect is detectable), achievable (assets and time are available to accomplish the objective), and quantifiable (the desired effect can be measured). The effects describe a physical or cognitive condition either in the information environment (focus on information content and flow) or against adversary forces (focus on cognition and behavior). IO objectives should not specify ways or means (that is, IO capabilities).

3-32. There is no doctrinal format for an IO objective. One possible format uses target, action, purpose, effect:

- *Target* describes the object of the desired effect.
- *Action* describes the capability or cognitive function of the target.
- *Purpose* describes what will be accomplished for the friendly force.
- *Effect* describes the outcome (for example, destroy, degrade, disrupt, or deceive).

3-33. It is important that IO objectives are written in terms of effects, because it is the desired effect that focuses the activities (tasks) of IO capabilities. For IO, a proper effect falls into one of the three following categories:

- *Effects against the adversary.* IO effects against the adversary focus on the adversary's ability to collect, protect, and project information. An example IO objective is to **disrupt** (effect) **insurgent** (target) abilities to **conduct C2** (action) to **surprise** adversary forces in and around Village X (purpose).
- *Effects to shape the information environment.* IO effects shape information content and flow within the operational area's information environment. An example IO objective is to **influence** (effect) **local populace** (target) **perception** of the insurgents (action) to **increase reporting** of insurgent activity and locations to coalition forces (purpose).
- *Effects to protect friendly forces.* IO effects regarding friendly forces seek to prevent adversary interference with friendly abilities to collect, protect, and project information. An example IO

objective is to **deny** (effect) **insurgent** (target) ability to **exploit** negative effects of friendly-force operations (action) to **prevent support** to adversary efforts (purpose).

Note. Figure 3-8 provides an example of directed effects.

3-34. Because it is impossible to anticipate all possible effects, terms other than those presented in this TC may be used to describe the desired effects for IO. Effects terms should describe a condition—not a task. Definitions may vary for the same effect based on the physical and cognitive nature of the effect and the target of the specific effect.

3-35. As IO objectives are developed, IO planners should consider the indications of success (MOEs) and how the indications will be collected. If adequate indications and collection means cannot be identified, the objective may have to be refined to produce measurable and detectable results. If an objective's MOE is focused on behavior or beliefs, planners must consider physical actions that are a result of the desired behavior, or belief, as an indicator.

Effects Against the Adversary		***Effects to Shape the Environment***	
Physical Effects	Cognitive Effects	Information Content	Information Flow
Destroy – Use lethal or nonlethal means to render adversary capabilities to collect, protect, or project information ineffective, unless reconstituted. **Degrade** – Use nonlethal or temporary means to reduce the adversary's effectiveness or efficiency to collect, protect, or project information. **Disrupt** – Interrupt the flow of information to and from the adversary and within the adversary organization. **Isolate** – Seal off an adversary from sources of support or contact with other adversarial elements.	**Deceive** – Mislead the adversary decision-makers, causing them to take specific actions or inactions that contribute to friendly-force mission accomplishment. **Influence** – Cause adversaries or others to behave in a manner favorable to friendly forces. **Isolate** – Prevent effective adversary decisionmaking by impeding the adversary's efforts to collect and project information.	**Destroy** – Use lethal or nonlethal means to render adversary information or information systems ineffective, unless reconstituted. **Degrade** – Use nonlethal or temporary means to reduce the effectiveness or efficiency of adversary message content. **Exploit** – Gain advantage of an adversary action that has negative effects on the populace. **Influence** – Cause adversaries or others to behave in a manner favorable to friendly forces.	**Degrade** – Use nonlethal or temporary means to reduce the effectiveness or efficiency of adversary communication methods with the populace. **Exploit** – Take advantage of gained access to a populace. **Isolate** – Prevent populace groups from communicating with each other. **Influence** – Cause information to move faster or slower, resulting in populace behavior that is favorable to friendly forces. **Disrupt** – Break or interrupt the flow of information between selected key-information nodes.
Effects to Protect Friendly Forces			
Deny – Withhold information about friendly-force capabilities and intentions that adversaries need to make effective and timely decisions. **Mitigate** – Reduce negative effects of friendly-force operations on the populace. **Neutralize** – Render an adversary's collection capability ineffective with regard to time, space, and purpose.			

Figure 3-8. Effects for information operations

ESSENTIAL INFORMATION OPERATIONS TASKS

3-36. At the tactical level, in a time-constrained environment, it is sometimes more straightforward to write IO objectives as EIOTs. EIOTs serve the same function as objectives; specifically, they focus the activities

(tasks) of the various IO capabilities. One difference is that EIOTs include the methods or means that will be used to perform the EIOT. A possible format for an EIOT uses task, purpose, method, effect:

- *Task* (for example, jam adversary's C2 communications).
- *Purpose* (for example, prevent coordinated efforts against friendly forces).
- *Method* (for example, EW EA-6B).
- *Effect* (for example, disrupt).

INFORMATION OPERATIONS TASKS TO SUBORDINATE UNITS AND STAFF ELEMENTS

3-37. Once IO objectives or EIOTs are written, IO planners develop tasks to subordinate units and staff elements that possess the IO capabilities needed to accomplish the IO objectives or EIOTs. Therefore, the aggregate execution of assigned tasks should achieve the effect of the IO objective or EIOT. Tasks for IO capabilities to subordinate units translate the broad concepts of the objectives and EIOTs into discreet actions. Tasks are often written as—

- *Task.* The task is the action to be performed and the location of the task (for example, prevent local populace interference in Village X).
- *Purpose.* The purpose is the reason why the task is assigned (for example, prevent civilian casualties).
- *Method.* The method describes what unit or capability will conduct the task (for example, MIS Team C121).

3-38. To develop tasks, IO planners should consider all available organic and supporting IO capabilities and resources that can help achieve each IO objective. As a matter of course, it is best to have representatives for each IO capability write their own tasks.

3-39. Similar to effects, tasks can be organized into three categories (Figure 3-9, page 3-13). These tasks are as follows:

- *Tasks against the adversary.* These tasks target adversary capabilities and vulnerabilities to collect, protect, and project information (as identified during the COG analysis). An example task is C*ounter insurgent propaganda to maintain populace support for capture/kill missions*.
- *Tasks to shape the information environment.* These tasks shape information content and movement by impacting the key nodes in each subinformation environment to influence local populace perceptions and behavior. An example task is *Engage religious leaders to stop inflammatory rhetoric.*
- *Tasks to protect friendly forces.* These tasks seek to protect friendly-force vulnerabilities in the information environment from adversary capabilities to collect and project information. An example task is *Detect intrusions into friendly-force information systems to prevent adversary collection of critical information.*

3-40. An IO planning work sheet (Figure 3-10, page 3-14) is a tool that can be used to develop an IO concept of support for input to COA development. One work sheet is filled out for each IO objective.

INFORMATION OPERATIONS CONCEPT OF SUPPORT

3-41. The IO concept of support is a word picture that explains how the information operation supports the operation from beginning to end, and how IO capabilities will be employed to provide information superiority. The IO concept requires defining information superiority for the operation. A well-written concept is concise and understandable. Although there is no doctrinally prescribed formula for an IO concept of support, leaders should consider the following:

- *Commander's intent for IO* describes what the commander wants IO to do to the adversary or to shape the information environment.
- *Information superiority* is described in the context of the operational situation and the command's mission; this should include the specific time and place for it to be achieved (should be linked to decisive points in the operation).

- *General plan for IO* lists the IO objectives, tasks to be executed, capabilities that will execute, associated MOEs for the objectives, and collection methods that will be used for assessment.
- *Priority of support* designates which subordinate unit or element has the priority of IO assets and capabilities. *Restrictions on the employment of IO* lists prohibited and directed actions that affect the employment of IO.
- *General scheme for IO* uses doctrinal concepts and terms to explain how the IO objectives will be achieved, who will perform them (that is, the tasked units), and the sequencing of key tasks; it relates the key tasks to the achievement of information superiority.

Tasks Against the Adversary	*Tasks to Shape the Environment*
Counter – Diminish adversary information to correctly portray friendly intent and actions. **Demonstrate** – Show or reveal. MILDEC typically conducts tasks to demonstrate. **Deter** – Prevent action through the existence of a credible threat of unacceptable counteraction. MISO forces typically conduct tasks to deter. **Disseminate** – Spread or disperse. MISO and CMO typically conduct tasks to disseminate. **Jam** – Interfere with or prevent the clear reception of signals by electronic means. EW typically conducts tasks to jam. **Persuade** – Induce to believe something or convince. MISO forces typically conduct tasks to persuade. **Prevent** – Keep from happening or avert. OPSEC typically conduct tasks to prevent.	**Broadcast** – Transmit and make public by means of radio or TV. Typically MISO forces conduct tasks to broadcast. **Demonstrate** – Show or reveal. MILDEC typically conducts tasks to demonstrate. **Disseminate** – Spread or disperse. MISO and CMO typically conduct tasks to disseminate. **Engage** – Initiate contact to open dialogue with or communicate a message to a target. MISO and CMO typically conduct tasks to engage; however, any friendly-force asset with access to the target has potential to conduct face-to-face engagements. **Inform** – Provide information or educate a specific target audience. MISO, PA, and CMO typically conduct tasks to engage; however, any friendly-force asset with access to the target has potential to inform through face-to-face engagements. **Persuade** – Induce to believe something or convince. MISO forces typically conduct tasks to persuade. **Publicize** – Bring to the attention of the public. PA typically conducts tasks to publicize.
Tasks to Defend Friendly Forces	
Detect – Discover or discern the existence, presence, or fact of an intrusion into information systems. IA, CI, and EW typically conduct tasks to detect. **Protect** – Guard against espionage or capture of sensitive equipment or information. OPSEC, IA, CNO, physical security, EW, and CI typically conduct tasks to protect. **Respond** – React quickly and appropriately to an adversary attack or intrusion in the information environment. All IO capabilities have potential to respond, depending on the specific incident. **Restore** – Bring information systems or conditions in the information environment back to their original state. IA typically conducts tasks to restore.

Figure 3-10. Example of an information operations planning work sheet

INFORMATION OPERATIONS CONCEPT OF SUPPORT SKETCH

3-42. The IO concept of support sketch is a visual graphic (Figure 3-11, page 3-15) of the information operation. It is the product used to brief the commander and staff on what IO capabilities will do during the mission. The format or medium used for the sketch is not as important as ensuring the correct elements of information are presented, that the sketch shows that the information operation is synchronized with other operations, and that it clearly depicts the synchronization of the IO capabilities involved with the operation. The sketch should answer the following questions:

- *Who?* What capabilities will be employed to perform the IO tasks?
- *What?* What operational advantage is provided by the information operation (that is, information superiority)? What objectives (or EIOTs) must be achieved and what are the required tasks to IO capabilities?

- *When?* What time during the operation will tasks be performed?
- *Where?* Where in the operating area will the IO tasks be performed?
- *Why?* What is the purpose of each IO task?

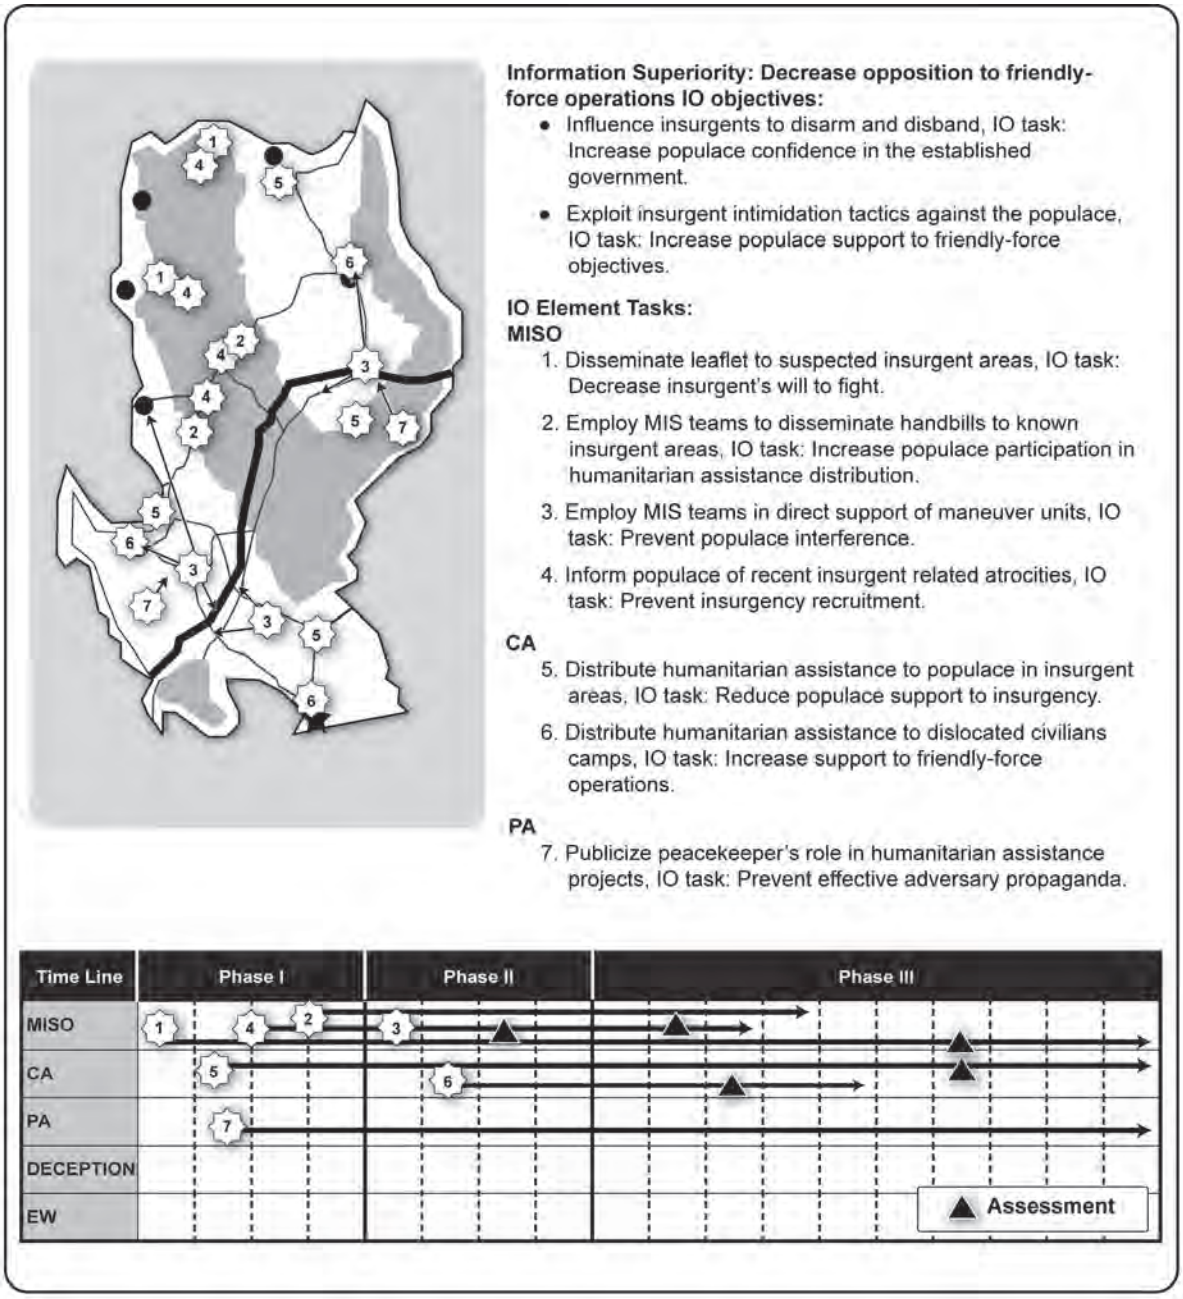

Figure 3-11. Example information operations concept of support sketch

ORDERS PRODUCTION

3-43. Plans and orders are as detailed as time permits. The size of these documents depends on the command and mission; they can run the gamut—from a series of overlays with written comments to voluminous documents of hundreds of pages. Regardless of the format used, an order must be clear, concise, timely, and useful to the implementing commands and units.

3-44. The IO annex (Army orders format) or appendix (joint orders format) describes the complete IO mission and how IO will gain information superiority in support of the scheme of the maneuver. This approach places a lesser emphasis on individual IO assets and capabilities and greater emphasis on the aggregate IO effects needed to achieve information superiority. The IO staff must be careful to not let the requirement to develop and explain IO capabilities contribution to the operation overwhelm the primary purposes of the IO annex, which are to—

- Provide operational details on the information operation.
- Focus element and unit tasks on achieving specific effects in the information environment.
- Provide the information needed to assess the information operation.

3-45. There are two basic formats for an IO annex: a five-paragraph (Figure 3-12, pages 3-16 and 3-17) and a matrix annex. The five-paragraph annex is used when sufficient planning time is available. The matrix annex is used when time is limited or when directed by the J-3/G-3/S-3 or unit SOP.

ANNEX P (INFORMATION OPERATIONS) TO OPERATIONS ORDER NO ##

1. SITUATION.

a. AO. Describe the information environment's subenvironments. Identify significant characteristics (for example, terrain, weather, populace, civilian information infrastructure, civilian population, and third-party organizations). State the aggregate impact on adversary and friendly operations. Identify aspects of the information environment, to include key information nodes that favor adversary and friendly operations.

b. Adversary Operations in the Information Environment. Describe how, when, where, and why adversary forces will operate in the information environment. Describe likely objectives and activities and how information capabilities will be employed. Identify adversary capabilities and vulnerabilities in the information environment in terms of information collection, protection, and projection.

c. Friendly Capabilities and Vulnerabilities in the Information Environment. Identify friendly-force capabilities to shape the information environment and attack adversary forces with information.

d. Civil Considerations. Identify key people, groups, and organizations that operate in the information environment and will affect friendly and adversary forces' operations. Describe likely objectives and activities in the information environment.

e. Attachments and Detachments. List organic and supporting assets that are available to execute the information operation.

2. MISSION. State the unit mission.

3. EXECUTION.

a. Concept of Support. Describe how IO will be conducted and who will perform it from beginning to end, to include adversary capabilities and vulnerabilities to be attacked and friendly critical vulnerabilities to be protected. Define information superiority (that is, the operational advantage derived from operating in the information environment) and explain how and when IO will achieve it. Include IO effects (that is, objectives or EIOTs), sequencing of key tasks, and IO capacities priorities by phase.

b. Assessment. Describe the assessment plan for the information operation.

c. Tasks to Subordinate Units. List subordinate units and assigned IO tasks.

d. Coordinating Instructions. List IO instructions common to two or more units. State any rules of engagement applicable to IO capability. List constraints not contained in the concept of support.

4. SERVICE SUPPORT. Identify requirements for support pertaining to IO as a whole. Identify service support to individual IO elements in their respective appendixes or annexes.

5. COMMAND AND SIGNAL. Significant command and signal information related to IO not covered in the base order. Include arrangements needed to exchange information among IO capabilities.

ACKNOWLEDGE: (If distributed separately from base plan/order)

APPENDIXES:

1. OPSEC
2. MISO
3. MILDEC
4. EW
5. IO Execution Matrix

Figure 3-12. Format for a five-paragraph information operations annex (Army orders format) (continued)

3-46. Typically, at the tactical level, the information operation can be adequately described on a matrix order format (Figure 3-13). When combined with a copy of the IO concept of support sketch, most IO capabilities can understand and execute accordingly. There is no specific format for an execution matrix. Figures 3-14 and 3-15, pages 3-18 and 3-19, are two examples.

Enemy Situation: See Appendix 1 to Annex B	**Friendly Situation:** XXI Corps EC-130H, EC-130E, EA-6B, F-16CJ (HARM), AC-130 (Specter)
Mission: Prevent preemption of air assault; influence local population to not interfere in and around the objective; shape the information environment to establish order and provide basic services.	**Information Superiority:** Dominance of the information environment which permits mission success without effective opposition and minimal civil interference.
Concept of Support: Prevent preemption of the air assault and minimize civil interference in and around the objective by destroying, degrading, disrupting, and exploiting adversary mission command and fire support systems; deceiving adversary decisionmakers; destroying, degrading, disrupting, and deceiving enemy information systems; denying adversary decisionmakers information about XXI Corps intentions and capabilities; protecting mission command and information systems.	
IO Objectives/Tasks: Prevent compromise of the operation; protect XXI Corps mission command; disrupt 109th Division air defense and targeting systems during critical periods of the operation; minimize civilian interference.	**Assessment:**
Coordinating Instructions: XXI Corps: Contact counterparts to coordinate and synchronize efforts to identify suspected SPF locations.	
Service Support: No change.	
Command and Signal: XXI Corps IO cell is located in the Main CP.	
Appendixes: Appendix 1 (OPSEC), Appendix 3 (EW), Appendix 4 (IO Execution Matrix).	

Figure 3-13. Example of a format for a matrix information operations annex (Army orders format)

Capability	*Phase I*	*Phase II*	*Phase III*	*Phase IV*
EW	Monitor signals of interest. Electronic protection for personnel and equipment.	Electronic attack to disrupt enemy communications. Electronic protection for personnel and equipment.	N/A	N/A
MISO	Broadcast harassment messages for enemy. Broadcast noninterference messages for local populace.	N/A	Broadcast via mobile radio to keep population informed on mission.	Broadcast on mission success. Coordinate with combat camera crews for post-mission propaganda and counter-propaganda.
OPSEC	Determine essential elements of friendly information for mission.	Implement measures to protect essential elements of friendly information to protect movement routes, mission command, and objective.	N/A	N/A
CNO	Maintain computer network defense to protect friendly communications and information.	Maintain computer network defense to protect friendly communications and information.	Maintain computer network defense to protect friendly communications and information.	Maintain computer network defense to protect friendly communications and information.
MILDEC	N/A	N/A	N/A	N/A
CMO	Prepare Commander's Emergency Response Program paperwork for funds disbursement. Coordinate with provincial reconstruction team.	N/A	N/A	Assist personnel returning to villages. Assess small-scale immediate projects.
PA	Prepare press releases.	N/A	N/A	Send press releases. Control local and national media.
COMCAM	Document operation.	Document operation.	Document operation.	Document operation.
HN Forces	Take lead in all lethal actions on the objective.	Take lead in all lethal actions on the objective.	Take lead in all lethal actions on the objective.	Take lead in all lethal actions on the objective.
Other	N/A	N/A	N/A	N/A

CONSIDERATIONS

3-47. IO planning can be initiated at the SFODA typically by the attached MIS element as the only information capability at that echelon, and finalized at the SOTF. Typically, an SFODA will not have access to all of the IO capabilities. When developing a concept of operations, planners must consider and include the applicable capabilities in Figure 3-14, page 3-18. The SOTF IO planner will coordinate for assets and synchronize and deconflict the effects. It is important for the SFODBs and SFODAs to understand the JSOTF/SOTF IO plans to ensure the higher HQ intent is nested within their plans.

CONSEQUENCE MANAGEMENT

3-48. When planning, the SFODAs should consider what actions to take if the operation does not go as planned. In the event that an operation does go awry, it is important to understand the information environment, to include the influential leaders that SFODAs and their FID partnered units should engage to assist in getting the appropriate information and messages to the populace. Also, it is important to note what media outlets are available to assist with getting ahead of the news cycle. Key consideration is that the first voice is the loudest. If the SFODA or the HN provides the facts of an operation or event in a timely manner, the adversary will be forced into defense and will have to react and counter the information as they fight to influence the population.

Chapter 4
Execution of Information Operations

This chapter focuses on the key staff tasks IO planners must accomplish during execution of an information operation. Once execution begins, IO planners monitor the adversary and friendly situations, track IO task accomplishment, determine the accomplishment of the IO objectives and tasks, and detect and track any unintended consequences. Three staff tasks critical to execution include the following:

- *Monitor.* Planners must maintain situational awareness and monitor the progress of operations to determine if the operation is going according to plan.
- *Evaluate.* Planners analyze the progress of the information operation, the status of the adversary, and the effects in the information environment to determine if there are variances from the plan and the significance of the variances.
- *Adjust.* Planners estimate the effectiveness of task execution and the effectiveness of IO on the adversary, the local populace, and friendly operations. If an unexpected incident occurs, IO planners—in coordination with current operations staff—coordinate with subordinate units and staff elements to develop an appropriate task for that incident.

MONITORING

4-1. The key to monitoring is the collection of information critical to execution of the information operation. The first step is determining what information is needed to evaluate and adjust the information operation. Two sources for deriving the information are the CCIR and the J-2/G-2/S-2 decision support template. From these sources, IO planners can determine their own information requirements; notably, intelligence requirements and FFIRs that will help guide the information collection effort.

4-2. Next, IO planners monitor both the command's overall operation and the IO tasks and activities as spelled out in the operation order, IO appendixes, annexes, and execution matrices. Then, operations reports and intelligence summaries are reviewed for IO-relevant information and paired against the IO objectives to evaluate progress of the information operation. If necessary, requests for information are submitted and tracked for clarification or additional information.

EVALUATING

4-3. The purpose of the assessment is to judge success or progress of the information operation. Progress is determined by analyzing relevant information and intelligence from unit operations and intelligence reports. The information is then applied against current IO objectives to determine whether the desired effects are being achieved. However the assessment is conducted, planners should consider the following principles:

- The assessment should lead to recommendations to the commander to continue, end, or change the operation.
- The assessment must detect situation changes quickly enough for commanders to respond effectively.

Page 2994 of 3957

- A balanced assessment considers changes in both the friendly and adversary forces' information environment.
- The assessment of an information operation should focus on collective rather than individual tasks and targets, because changes in the information environment or adversary force usually are not the result of any single task or target.

4-4. Assessing IO can appear complex and difficult, but it need not be burdensome if IO planners use a simple methodology to assess the information operation. In principle, assessing an operation consists of evaluating the operations against measures of performance (MOPs) and MOEs.

Note. IO planners must be careful not to over assess by becoming bogged down in formal assessment procedures for numerous tasks and effects, or to overwhelm subordinate units or staff elements with requirements for numerous reports, questions, and information requirements.

4-5. MOPs measure friendly actions in terms of task accomplishment and performance. IO cannot generate effects if the planned tasks are not successfully executed. As such, assessment should account for task execution. Because task completion affects execution as well as assessment, it is important that the IO capability representatives and subordinate units report accomplishment of their respective tasks. MOPs are not measures of success—they gauge task completion and do not measure effect success or failure.

4-6. MOEs are used to measure the results achieved in the overall mission and execution of IO objectives. More practically, MOEs determine if a desired condition or outcome is in place (that is, effect), even if not directly caused by planned military action. Because IO objectives are written to articulate a specific condition or state in the operational environment, most MOEs are crafted and used to measure the effects generated by those tasks collectively executed to achieve each IO objective.

4-7. An assessment plan is normally developed as part of the planning process. For complex or long-term operations, it may be necessary to form an assessment working group to produce the information required to assess the information operation. Attendees to the working group may include representatives from the J-2/G-2/S-2; J-3/G-3/S-3; plans directorate of a joint staff (J-5); assistant chief of staff, plans staff section (G-5); MISO; EW; CA; and PA. During combat operations, the combat assessment board may supplant the assessment working group.

Note. One of the critical factors in a successful relief-in-place or transfer of authority between IO planners is the passing on of all historical IO data and ongoing assessment plans.

4-8. There is no standardized or doctrinal assessment process. In the absence of a doctrinal process, IO planners must develop their own methodology to guide assessment. Based on field experience, the following process is a logical approach to assessing an information operation:

- *Develop assessment criteria.* The first step in the assessment process is to develop the assessment criteria. This involves developing the items that support the MOE, indicators, and MOPs. One or more MOE is normally developed for each IO objective. Each MOE should clearly articulate the desired condition (effect) or end state that supports the associated IO objective. For example, for an IO objective to "reduce popular support for insurgents," an MOE could be "level of popular support to insurgents." Next, indicators are developed for each MOE. Multiple MOEs should be developed and used to determine if the IO objective is being achieved. Indicators for the MOE "increased reporting of insurgent activities" could include increased tips-line reporting, increased tips to patrols, and increased walk-in tips. MOPs assess task accomplishment. Example MOPs include the number of face-to-face interviews conducted, the number of handbills disseminated, and the number of radio broadcasts (all observable and measurable activities).
- *Define the measures.* Once MOEs, indicators, and MOPs are developed, IO planners establish a foundation for comparison and analysis (also known as *benchmarking*). Benchmarking determines the current state of MOEs and supporting indicators.

- *Collect and analyze data.* The next step is to identify sources of data needed to assess the MOEs, indicators, and MOPs. Data collection requirements should be kept as simple as possible. When possible, standard operations and intelligence reports are used as the means to collect the data. Figure 4-1 shows some data collection sources.
- *Provide recommendations.* Assessment should yield changes to execution (based on MOPs), changes to desired effects (based on MOEs), and changes to resource allocation. Recommendations based on the assessment should provide the commander with the bottom line, a recommended way ahead, and any issues requiring the commander's involvement.

Data Collection Sources	
Internal	Situation reports, intelligence summaries, current operations data, and other command reports.
Organic	HUMINT, CA, MISO, and PAO reports; significant acts database; subordinate unit assessments.
External	Other government agencies, international organizations, polling and populace surveys, media analysis, OSINT.

Figure 4-1. Sources of data collection

4-9. As the data is collected, it should be analyzed against the established indicators to establish the benchmarks. Follow-on data collection periods and assessments establish changes to the indicators and MOEs. The sum of indicators then provides the assessment for each MOE. Figure 4-2 shows an example of an assessment graphic.

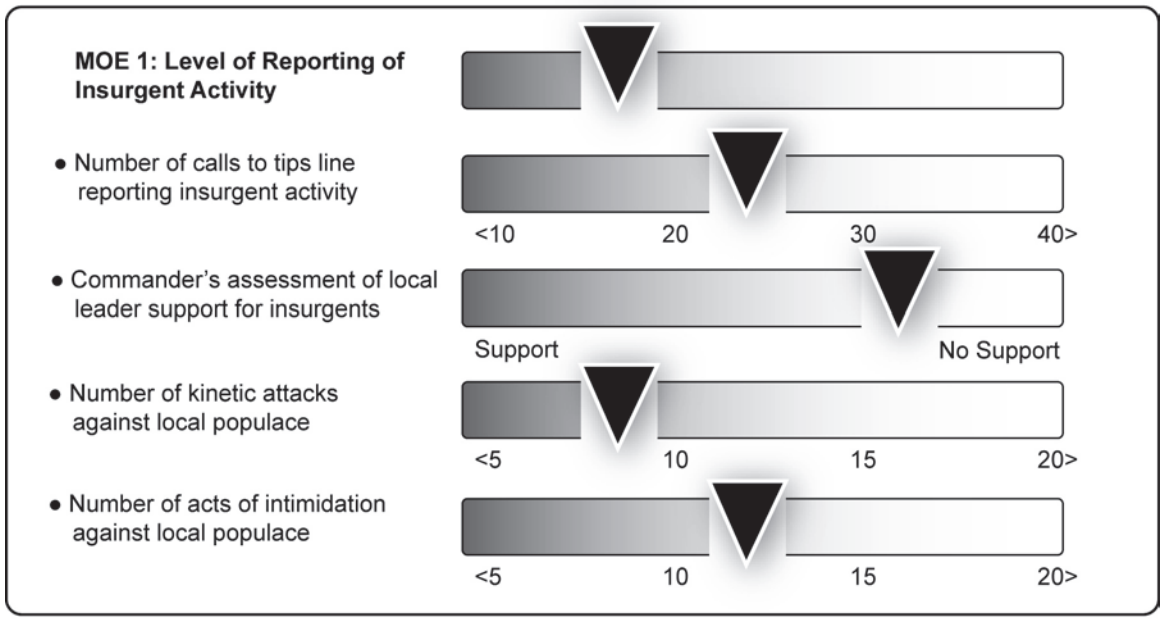

Figure 4-2. Example of an assessment graphic

ADJUSTING

4-10. The ways that IO planners can adjust the information operation in response to events in the information environment are battle drills, the IO working group, and crisis-action teams. In a best-case scenario, IO planning accounts for all possibilities and sets conditions for further operations. The information environment is never static, and planning for consequence management through battle drills and rehearsed crisis-action teams is critical to staying ahead of the adversary's information cycle. By the same token, proactive planning of synchronized IO efforts helps preclude reactive IO responses

for example, facilitating more timely and better prepared MISO and PA products and preplanned key-leader engagements.

BATTLE DRILLS

4-11. Staff battle drills are planning aids designed to speed response to crisis situations that occur during the conduct of a mission. For IO, quick responses to the adversary's actions and events in the operational area are necessary to beat the adversary in the information environment and ultimately achieve information superiority.

4-12. Battle drills are developed during the planning process; however, they are not complete and final COAs. Rather, battle drills are predeveloped concepts that anticipate crises. Once a crisis occurs, the battle drill (that is, the COA) can be quickly adjusted to address the realities of the situation at hand.

4-13. A military operation can be thought of as a series of events, planned and unplanned, that force both friendly and enemy forces to react to a changing situation. Some of these events, referred to as critical events, are keys to mission success of friendly or enemy forces. Critical events—

- Can create both intended and unintended effects and may be brought on by friendly, adversary, or third-party actions.
- Can be either negative or positive. The staff can develop drills that react to either type. For negative critical events, a battle drill should mitigate the impact of the event on the populace and friendly forces. For positive critical events, a battle drill should exploit the event to maximize the impact on the populace and adversary forces.
- Can be triggers or cues for the staff to initiate a battle drill.

4-14. An IO battle drill is a generic concept of support that addresses a friendly-force IO response to a critical event that may occur during execution of the operation. There is no established format for battle drills, though it should be recognizable to the staff and mirror existing products. Development of battle drills does not follow an established guide, but rather, they are developed to suit specific missions and potential branches and sequels of missions. Each battle drill should—

- Identify critical events.
- Define information superiority.
- Develop IO concept of support.
- Determine tasks and targets.

The information contained in a battle drill is not a final and complete plan, but rather a concept that must be refined to the realities of the situation at hand. Depending on the battle drill, productions of approved MISO products (such as radio scripts or other products) may be appropriate.

Identify Critical Events

4-15. Planners determine what critical events may result from friendly, adversary, or third-party action. During an upcoming operation, planners focus on events that will either occur in or affect the information environment and are significant enough to affect the command's mission. The following list provides some examples of critical events:

- Civilian collateral damage.
- Civilian casualties.
- Fratricide incidents.
- Populace interference with friendly-force operations (for example, civil demonstrations).
- Quick-reaction force deployment.
- Adversary or friendly forces violation of law of land warfare (for example, atrocities against civilians, mass-grave discovery).
- Environmental incident (for example, hazardous-material spill).
- Propaganda directed against friendly forces.
- EEFI or any other sensitive or classified information disclosure.

Define Information Superiority

4-16. Battle drills are designed to respond to a specific situation. Therefore, the situation must be sufficiently defined so the IO planners can adjust the battle drill's concept to compensate for the differences between the planned and actual situation. For IO, this means defining information superiority for each battle drill. Information superiority is the operational advantage provided to the commander through the control and management of information content and flow in the AO. Examples of information superiority for mitigation and exploitation battle drills are as follows:

- A mitigation battle drill:
  - *Event.* Disclosure of EEFI or classified information.
  - *Target.* Adversary.
  - *Information superiority.* Adversary decisionmakers are unable to take advantage of sensitive information about the friendly force.
- An exploitation battle drill:
  - *Event.* Destruction of key infrastructure by adversary.
  - *Target.* Populace.
  - *Information superiority.* Populace does not support the actions of enemy forces.

Develop Information Operations Concept of Support

4-17. The concept of support is a concise and easily understandable word picture describing how IO capabilities may be employed and what staff coordination must be conducted to employ the capabilities. The concept must be integrated with the overall operation, when applicable. How much information is known when the battle drill is created determines the level of detail. The IO concept of support should include the following:

- *Assumptions.* Planners list information accepted as true in the absence of facts at the time the battle drill is developed. Planners periodically review and update the battle drill by validating the assumptions.
- *Information superiority.* Planners determine and then describe the operational advantage IO will provide.
- *General scheme for IO.* Planners use doctrinal concepts and terms to explain how IO will achieve information superiority, listing any IO objectives, EIOTs, and who will perform each key task at what time.

Note. Where the tasks are performed is determined once the battle drill is put into action.

- *Priority of support.* Planners designate which subordinate unit or element has priority use of IO capabilities.
- *Constraints on IO.* Planners list prohibited and directed actions that are expected to affect the information operation, paying particular attention to information content and flow (for example, no jamming in urban areas).

Determine Tasks and Targets

4-18. Leaders develop tasks, purpose, methods, and means, and, if appropriate, targets for each participating IO capability. A purpose for each task is included to explain each capability's part in the operation. If appropriate, general target sets are identified for each tasked element or capability. All IO-relevant capabilities—maneuver units and those staff entities that may have important roles in responding to the battle drill event—are considered. A purpose for each task is included to maximize asset initiative. Supporting elements develop MOP for their assigned tasks.

Note. The formal battle drills are developed and coordinated at the SOTF level. The SOTF IO planner will use the 7-day mission tracker to ensure they are ready to provide support upon start of mission.

EXAMPLE STAFF BATTLE DRILL

4-19. There are several different battle drill formats currently in use. Figure 4-3 provides a sample format that has worked well in the field. Leaders should modify the format as needed to fit the command's needs and situation. Figure 4-4, page 4-7, provides an abbreviated staff battle drill.

SITUATION: Insurgent forces attack friendly forces, a friendly third-party organization, or an opposing faction (for example, a bombing, shooting, or mortar attack).

ASSUMPTIONS: The insurgent attack does not cause significant friendly causalities.

LIKELY FRIENDY ACTION: A response force is deployed to secure the site, and find and destroy the insurgent force. Security operations are conducted in and around the area of attack. If necessary, force protection measures are increased.

IO CONCEPT: The purpose of this IO is to gain populace support for counterinsurgency activities and identify hidden insurgent cells for targeting. IO capabilities provide direct support to the response force. MIS teams disseminate print products to the populace near the attack site. Unit leaders, MIS teams, and CA teams engage local leaders to gain support for friendly operations. PAO issues a press release to explain the command's position and counter misinformation concerning the situation. **Restrictions:** MISO products must conform to and support approved programs. **MOE:** Increased reporting of insurgent activity by populace.

Capability	*Key Tasks*	*Purpose*	*Method*	*Target*
MISO	Disseminate print products and radio broadcasts to the populace of villages in and around the attack site.	Identify hidden insurgent cells. Reduce populace support for insurgent forces and activities.	Handbills and posters. Contact radio.	Local populace. Insurgent fence-sitters.
CA	Engage local leaders.	Gain support for counterinsurgency activities.	Face-to-face.	Civil leaders.

Figure 4-3. Battle drill format for insurgent-related violence

INFORMATION OPERATIONS WORKING GROUP

4-20. An information operations working group (IOWG) consists of staff representatives who meet to coordinate and provide recommendations for the planning, execution, and assessment of IO. The IOWG also is used to synchronize the contributions of the IO capabilities. Participation in the IOWG is typically a mix of staff representatives and subject-matter experts.

Note. IOWGs are formed at the SOTF and JSOTF levels.

4-21. The frequency of IOWG meetings depends on the situation and echelon. The working group may gather daily, weekly, or monthly depending on the situation, echelon, and time available. The formality of the IOWG also varies by echelon. For purposes of organization and focus, even the simplest IOWG should have an agenda. The composition of the IOWG is tailored to the agenda. Representatives from every staff

need not attend every IOWG. Participants are selected because they either represent a critical element or capability or because they have expertise that is critical to the information operation. Typical attendees include the following:

- IO planners.
- MIS representatives.
- EW representatives.
- OPSEC representatives.
- COMCAM representatives.
- CA representatives.
- PA representatives.
- MILDEC representative.
- Representatives from the J-2/G-2/S-2.
- Representatives from the J-3/G-3/S-3, effects cell.
- Special technical operation planners.
- Fire support officer.
- Others, as required.

Note. Appendix A, pages A-1 through A-6, provides detailed information on IOWG.

1. **Situation:** React to collateral damage resulting from coalition-force action.
2. **Information Superiority:** Preempt adversary propaganda and negative media reporting.
3. **Immediate (on-site):**
   - Notify commander.
   - Document the scene (for example, COMCAM photos).
   - Conduct on-site key-leader engagement to determine facts and conduct initial mitigation.
4. **Within 2 Hours:**
   - Notify operational-area owner.
   - Notify local-government officials.
   - IO coordinates and synchronizes a public statement of the facts for broadcast by local print, radio, and TV media.
5. **Within 24 Hours:**
   - Conduct key-leader engagements with local elders using HN partner-unit commanders, coalition commanders, and local-government officials.
   - Assess damage for possible CMO projects.
6. **After 24 Hours:**
   - Coordinate for follow-up media coverage and key-leader engagement by operational-area owner.
   - Compensate family (if appropriate) and conduct CMO activities.

Figure 4-4. Abbreviated staff battle drill

CRISIS-ACTION TEAM

4-22. For significant operational matters, a crisis-action team may be activated. The crisis-action team consists of key members of the staff, to include the IO officer. When activated, the crisis-action team plans and rehearses the command's reaction to the event, and then issues a fragmentary order. To be a viable participant, IO planners should develop response options to support the crisis-action team planning process. When possible, IO planners use battle drills as the basis for adjustments to the information operation and tasks to the IO capabilities.

REPORTING

4-23. Significant events and friendly- and adversary-force activity in the information environment should be routinely reported to the J-2/G-2/S-2, J-3/G-3/S-3, and, as appropriate, the higher HQ' IO staff. The guiding principles for reports are to—

- Keep the report as simple and as short as possible.
- Include only that information which feeds a planning, assessment, or reporting requirement.

4-24. At the JSOTF, it may be useful to develop an IO intelligence summary or IO operation summary. Depending on the mission and tempo of the operation, these reports may be daily, weekly, or monthly products. The IO situation report is an event-driven report that provides basic information on significant activity in the information environment as it occurs.

INFORMATION OPERATIONS INTELLIGENCE SUMMARY

4-25. An intelligence summary is provided to subordinate commands, interested staff elements, and higher HQ. The primary focus of the report is to capture significant events in the information environment (focused on the IO planners' intelligence requirements) and assess their impact on friendly- and adversary-force operations.

INFORMATION OPERATIONS OPERATION SUMMARY

4-26. Subordinate units provide operation summary reports on the status of IO in their respective AOs. The primary focus of the report is assessment. The report provides recent significant activities, current and planned operations, capability status, and assessment of IO objectives, key tasks, and engagements.

INFORMATION OPERATIONS SITUATION REPORT

4-27. The purpose of the IO situation report is to provide an update since the last reporting period. An IO situation report is event-driven by significant changes to the characteristics of the subinformation environments with regard to information content and flow, or modifications to adversary actions that address the characteristics. The information in the situation report usually consists of the 5Ws (who, what, when, where, and why). Situation reports are rendered as needed.

4-28. At the SOTF level and below, an IO summary should be produced. The IO summary should include significant events in the information environment, focusing on—

- IO planners' intelligence requirements and assessments of their impact on friendly- and adversary-force operations.
- Recent significant activities, current and planned operations, capability status, and activities and assessment of IO objectives and key tasks.
- Engagements and significant changes to the characteristics of the subinformation environments with regard to information content and flow.
- Modifications to adversary actions that address the characteristics.

Chapter 5

Intelligence Support to Information Operations

Intelligence is the product resulting from the collection, processing, and integration of information and knowledge about adversaries and their networks obtained through observation, investigation, analysis, or understanding. IO planning and execution rely on the existing intelligence capabilities of the command to provide support. IO significantly increase the demand for intelligence and require detailed analysis of the information environment and the adversary's use of the information environment.

Intelligence support to IO is not solely an intelligence-community task. The intelligence staff is responsible for coordinating and overseeing all command intelligence; however, each staff section and element involved in planning and execution has a responsibility to assist in this task. Thus, IO planners should work closely with intelligence personnel throughout the intelligence cycle to ensure effective intelligence support, but they must also conduct their own research and analysis.

Intelligence support to IO is continuous and requires long lead times. The intelligence necessary to affect the perceptions and decisionmaking of adversaries or other audiences often requires that specific sources and methods be positioned and employed to collect the information and conduct the analyses needed for the information operation. The challenge is to get the right information and intelligence at the right time.

As in other intelligence activities, analysts should be careful not to describe or portray the adversary's actions in the information environment as a mirror image of U.S. IO concepts, doctrine, and TTP. Culturally, the adversary is unlikely to think or act as the United States does.

The key terms used in this chapter are defined below:

- *Information requirement.* Information requirements are information elements required for planning, executing, and assessing operations.
- *Intelligence requirement.* An intelligence requirement is a requirement for the intelligence system to fill a gap in the commander's and staff's knowledge or understanding of the operational environment or threat.
- *Priority intelligence requirement.* The commander designates PIRs. PIRs are requirements associated with a decision that affects mission accomplishment. Information requirements not designated by the commander as PIRs become intelligence requirements.
- *Intelligence estimate.* An intelligence estimate is an appraisal of available intelligence relating to a specific situation or condition with a view to determining the COAs open to the enemy or adversary and the order of probability of their adoption.
- *Intelligence preparation of the operational environment.* IPOE is an analytical methodology employed to reduce uncertainties concerning the enemy,

Page 3002 of 3957

environment, and terrain for all operations. IPOE builds an extensive database of potential areas where units may be required to operate. The database is analyzed in detail to determine the impact of the enemy, environment, and terrain on operations and then presents the analysis in a graphic form. IPOE is a continuing process. In joint doctrine, IPOE is referred to as joint intelligence preparation of the operational environment.

INFORMATION OPERATIONS AND THE INTELLIGENCE CYCLE

5-1. All intelligence for the command and staff, to include that needed for IO, is produced as part of the intelligence cycle. By working closely with the J-2/G-2/S-2 during the intelligence cycle, IO planners can minimize intelligence gaps and maximize available intelligence and collection assets to develop a reasonably accurate understanding of the information environment and a representative and reliable model of adversary operations in the information environment. To integrate into the intelligence cycle, IO planners—

- Identify intelligence gaps (IO-specific) concerning the information environment and adversary operations in the information environment, develop PIRs, and submit requests for information to fill the gaps.
- Become familiar with available collection assets, capabilities, and support relationships (direct support or general support). Planners determine time requirements for each collection asset and consider the capabilities and limitations of the assets that will perform the mission.
- Coordinate with the collection manager to ensure information requirements for IO are considered for inclusion as collection tasks.
- Establish relationships with key intelligence personnel. Planners should not go directly to an analyst without awareness or concurrence of J-2/G-2/S-2 leadership.
- Vet all intelligence products developed from reachback support and other external sources through the J-2/G-2/S-2 to avoid disconnected analysis.
- Provide feedback on the quality of intelligence provided and its usefulness to facilitate refinement.
- Assess the intelligence support that is provided to improve the working relationship with the intelligence staff while providing feedback to the intelligence analyst for improvements.

INTELLIGENCE “PUSH” AND “PULL”

5-2. Intelligence is disseminated by either the “push” or “pull” principle. For “push,” IO planners must coordinate with the J-2/G-2/S-2 staff to get access to the dissemination means that have IO-pertinent products. This is accomplished by working with the intelligence analysts to get IO-specific information requirements injected into the collection cycle, nominating PIRs for either the information environment or adversary actions in the information environment, and coordinating with higher HQ IO staffs to get routine access to their intelligence products. To “pull” intelligence from the J-2/G-2/S-2 staff, IO planners should coordinate for access to those assets and systems that have IO-relevant information and intelligence, attend J-2/G-2/S-2 staff updates and fusion meetings, and coordinate with troop units and specialized teams (SFODAs, MIS teams, CA teams, and so on) to collect and report collateral information that is relevant to IO.

5-3. OSINT is an often overlooked way to get information and intelligence. Much useful information about the populace and media is available from public sources. This information often addresses the IO’s information and intelligence requirements. Like other aspects of planning, IO planners must be prepared to conduct their own OSINT gathering.

REQUESTS FOR INFORMATION

5-4. Intelligence production is requirements-driven. Requests for information are used to request specific information and intelligence. Each command has its own requests for information format and procedures; however, the following rules should be observed when developing requests for information:

- *Conduct initial research.* Units should try to find the information or intelligence on their own, using requests for information to get information that is not readily available. Sources already checked should be listed so the intelligence analyst does not waste time working with materials and products that do not have the requested information.
- *Clearly state the requirement.* Units should describe—as specifically as possible—what information is needed. Language and terms associated solely with IO should be avoided, as should requests for a particular type of intelligence (for example, SIGINT or HUMINT). Requests for information should be restricted to one question.
- *Justify the request.* Units must articulate why the request is important. For greater priority, units may try to tie the requests for information to a PIR.
- *State accurately the latest time the information will be of value.* Units should state when information will no longer be useful, being truthful about the date. The information that units provide affects collection management and assets dedicated for higher-priority missions.

INTELLIGENCE PREPARATION OF THE OPERATIONAL ENVIRONMENT

5-5. The basis of intelligence support to IO is the IPOE process, a prerequisite to planning any operation. The mechanics of analyzing the information environment and adversary operations in the information environment are generally the same as those established to support IPOE for other military planning. Ideally, the J-2/G-2/S-2 has the lead on conducting IPOE and will include IO considerations in the analysis. However, IO planners can expect to assist in the process or conduct portions of the IPOE that are specific to IO. In such a case, J-2/G-2/S-2 products should be used as the basis for any IO-oriented analysis.

5-6. Information IPOE differs from traditional IPOE in purpose, focus, and end state. The purpose of IPOE is to gain an understanding of the information environment in a specific geographic area and to determine how the adversary will operate in that environment. The focus is on analyzing the adversary's use of information to gain an advantage. The end state is the identification of adversary vulnerabilities that friendly forces can exploit with IO, and adversary capabilities in the information environment against which friendly forces must defend.

5-7. For IO, IPOE results in the production of a graphic visualization product known as the CIO. The CIO is a map of the information environment that shows where and how information content and flow will affect military operations.

VISUALIZING THE INFORMATION ENVIRONMENT

5-8. To employ IO properly, commanders and staffs must grasp the character and impact of the information environment in their operational area. To do this, it is necessary to rationally analyze the information environment using the IPOE process and the three-dimensional model of the information environment (as described in Chapter 1).

5-9. Every operational area has an information environment with information moving through it. This information flow (the information domain) creates tangible, real-world effects by converting real-world situations (the physical dimension) into human perceptions that form the basis of individual and organizational behavior (the cognitive dimension).

5-10. Visualization of the information environment begins with the identification of its significant characteristics. To do this, planners must examine the operating area and identify the existing and projected characteristics that are relevant to the content and flow of information (for example, Step 1 of IPOE).

Although there is no single set of characteristics useful for analyzing every information environment, some broad characteristics that can serve as starting points are terrain (weather), populace, civilian information infrastructure, civilian population, and third-party organizations. Figure 5-1 provides a broad list of characteristics of the information environment.

Significant Characteristic	*Elements of the Characteristic*	*Information Requirements*
Terrain	Those aspects of terrain and geography that impact information content and flow.	• How does terrain (and weather conditions) canalize and compartmentalize information content and flow? • How does terrain (and weather conditions) impact information flow?
Civilian Information Infrastructure	Key information system links and nodes (information conducts) in the operating area.	• What are the key information systems (telephone, microwave, Internet, and so on)? • What information content is passed on each information system? • Who (friendly forces, enemy, civilians, other organizations) uses each information system? • Who manages and controls the information systems?
Media	Radio, TV, print, and Internet, to include audiences.	• What media sources are available (for adversary and friendly use) in the AO? • What information content is reported by each media source? • Who is each media's audience? • What is the context or bias of the media outlets?
Civilian Population	• Demographics, such as distribution, language, religion, ethnicity, and education. • Cultural factors, such as societal structures, ideologies, perceptions, and beliefs.	• How does the populace communicate? • What information content does the populace need or want? • What are the populace's biases? • What is the populace's social organization? • What are the populace's cultural characteristics?
Third-Party Organizations	Interagency, nongovernmental organizations, private volunteer organizations, and international organizations that can be competing influences in the information environment.	• Who are the interagency, nongovernmental organizations, private volunteer organizations, and international organizations in the AO? • What are their purpose, goals, and objectives? • What information do these organizations project?

Figure 5-1. Visualization of the information environment

5-11. Planners analyze each of the previously identified significant characteristics using the three-dimensional model to determine specific impacts on operations in the information environment (that is, Step 2 of IPOE). To accomplish this task, each characteristic is considered within the framework of the three following dimensions:

- *Physical.* Units focus on what information systems in the operational area collect, process, and disseminate information. Identification should include the tangible aspects of each significant characteristic, such as technical information systems and networks (for example, radio towers, fiber-optic networks, and telephone networks) and nontechnical (human) information network nodes and links (such as persons with influence, key leaders, and face-to-face communications networks). Additionally, analysis should show where those information systems and networks are located in the physical environment.
- *Cognitive.* Units focus on the values, beliefs, and perceptions of key individuals and organizations in the operational area that make decisions, as well as how those decisions are formulated. This analysis should show how this human mental programming affects the value of specific information to those key individuals and organizations in the operational environment.
- *Information.* Units focus on how information flows and the content of that information. Flow describes the exchange of information in terms of conduits, form, and speed. Content includes the major subjects or topics circulating in the AO.

THE COMBINED INFORMATION OVERLAY

5-12. Analysis of the information environment should result in a CIO. The CIO (Figure 5-2, page 5-6) is not a static document; it is intended to be a working product that is continually refined as new information becomes available. Building a CIO begins with a map of the operational area (ideally the same map used by the intelligence and operations staffs). The information environment's significant characteristics are combined and plotted on the map to show aggregate effects in relation to the terrain of the operational area. This should result in the identification of subinformation environments.

5-13. Subenvironments are areas in which the information environment's significant characteristics and effects notably differ from adjacent areas. Because the composition of the information environment is not uniform, there will be distinct subinformation environments in the operating area. Physical features and cognitive aspects of the information environment determine subinformation environments. Leaders must consider that subinformation environments may transect international borders and unit boundaries. For example, subinformation environments may be based on the significant characteristics of ethnicity, media presence, and population density. One subenvironment may have a single ethnic group with widespread access to media and information, whereas another subinformation environment may have an entirely different populace group with limited or no access to outside media. The subenvironments can be further analyzed to determine their composition and character. Ideally, analysis will identify those parts of the operational area that favor either the friendly or adversary forces' operations.

5-14. After subenvironments are identified, key information nodes are selected within each subinformation environment. Information nodes are places, persons, or infrastructure that shape information content and flow by creating or transmitting information. Identifying key nodes is important because these areas may be the most-effective means for inserting messages into the local populace or adversary networks. The nodes critically affect information content and flow. Each subinformation environment will likely have one or more key information nodes. An information node can be human (for example, key communicators or leaders), technological (for example, cellular telephone towers, media outlets, and religious or meeting centers), or both. Nodes critical to both are key terrain in that they critically affect information within the operational environment and provide an advantage to either adversary or friendly forces. For example, a well-known mosque with an influential imam is a possible candidate for a key node because it creates or perpetuates information content affecting military operations.

5-15. The CIO is a guide, not a rigid template. It typically depicts mission-significant aspects of the information environment, subinformation environments, key information nodes, and information flow in the operating area. The information included in the graphic should be presented in a concise manner. Whatever final form the CIO takes, it must present an operationally-relevant overview of the information environment. Every CIO will be unique because every information environment is different.

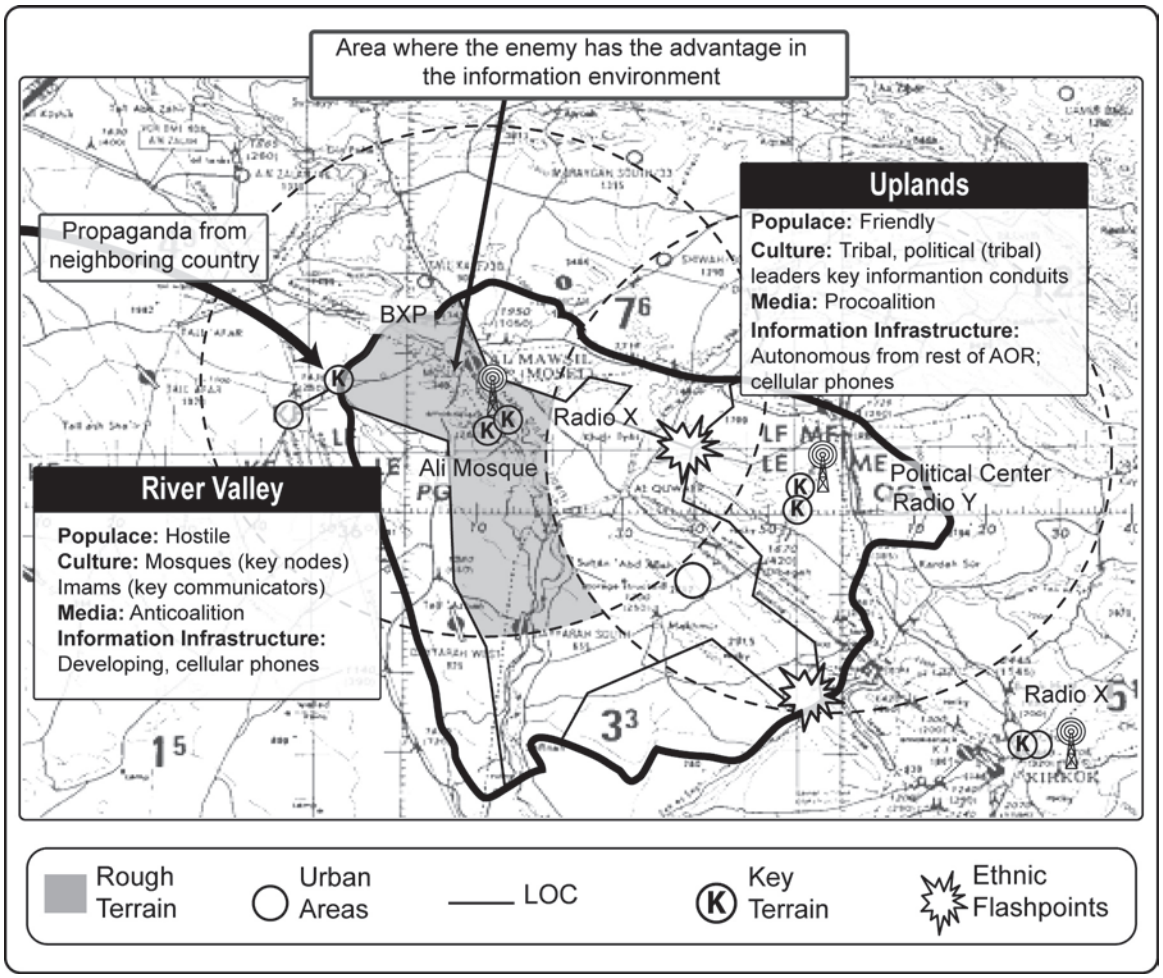

Figure 5-2. Example combined information overlay

ADVERSARY OPERATIONS IN THE INFORMATION ENVIRONMENT

5-16. Information and the information environment are not benign and often favor one side over another. Opposing forces use the information environment just as they use the physical environments of air, land, and sea to place their enemy at a disadvantage and to achieve their objectives. Understanding this, IO planners must identify how the adversary views and uses the information environment.

5-17. The adversary does not use the information environment in the same way or have the same constraints and means as U.S. forces. To avoid mirror-imaging the friendly concept of IO upon the adversary and to prevent mismatching U.S. capabilities and vulnerabilities, adversary operations in the information environment can be viewed in terms of activities to collect, protect, and project information. These three functions are universal to any armed force's ability to use information as combat power regardless

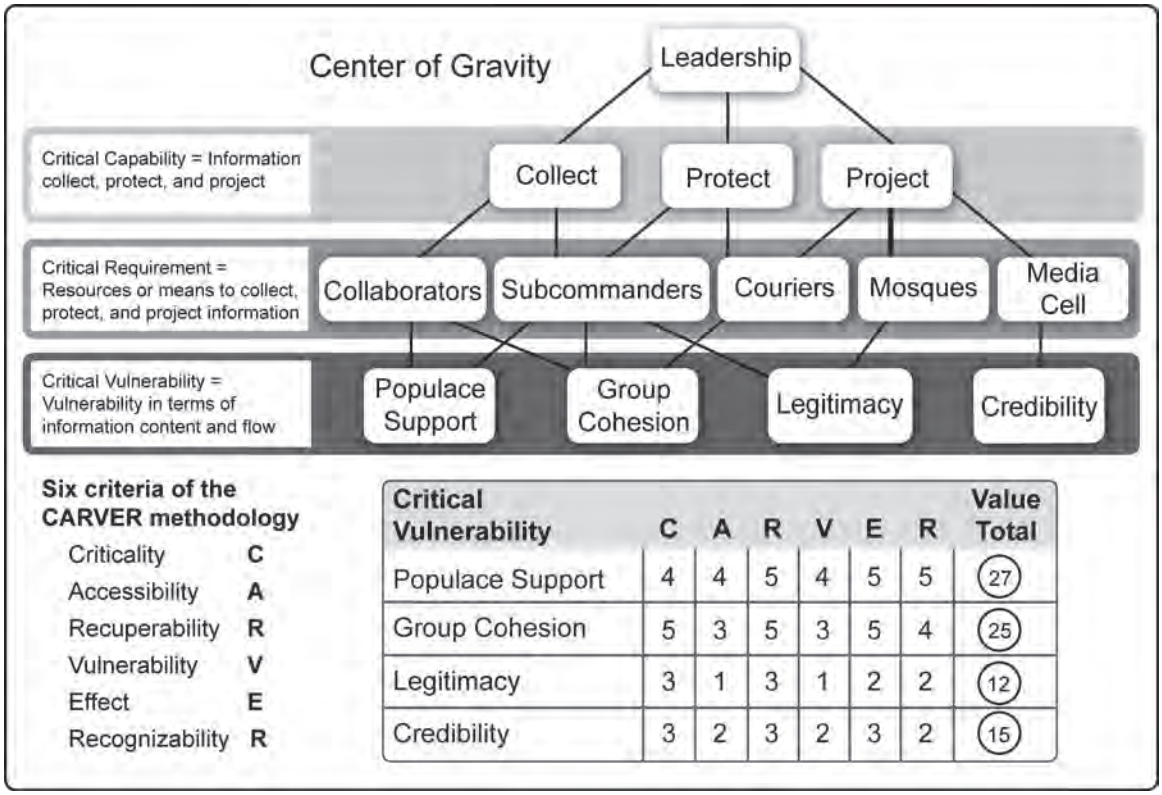
of its organization, capabilities, and mission. As such, they form the basis of the adversary's capabilities (and vulnerabilities) in the information environment. Collect, protect, and project are defined as:

- *Collect.* To plan and execute operations, the adversary must collect accurate and timely information.
- *Protect.* To be successful, the adversary must protect its critical information from collection and maintain its means of communication.
- *Project.* To further its goals and objectives, the adversary must project the information into the information environment to influence the perceptions of its target audiences.

5-18. Depending on the adversary, the means used can be as simple as direct human observation and open sources (collect); couriers and intimidation (protect); and night letters, other printed materials, and graffiti (project). Ideally, analysis of how the adversary operates in the information environment is based on modeling, or templating.

TEMPLATING USING CENTER-OF-GRAVITY ANALYSIS

5-19. Once a clear understanding of the environment is established, IO planners should analyze adversary capabilities, requirements, and vulnerabilities in the information environment (Figure 5-3). The purpose of performing a COG analysis is to determine and evaluate the adversary's critical vulnerabilities for exploitation. Because this tool is used to evaluate the adversary, the appropriate time to perform this analysis is during Step 3 (evaluate the threat) of IPOE. The results of the COG analysis are later used during COA development to exploit identified vulnerabilities.



Critical Vulnerability	C	A	R	V	E	R	Value Total
Populace Support	4	4	5	4	5	5	27
Group Cohesion	5	3	5	3	5	4	25
Legitimacy	3	1	3	1	2	2	12
Credibility	3	2	3	2	3	2	15

Figure 5-3. Example center-of-gravity analysis and the use of the CARVER process to rank and plot critical vulnerabilities in the information environment

5-20. The COG analysis of the adversary should be conducted by the J-2/G-2/S-2. If not, IO planners and operational detachments in the field can use a COG analysis to analyze the adversary in the information environment by—

- *Identifying potential threat COGs.* Visualize the threat as a system of functional components. Based upon how the threat organizes, fights, makes decisions, and its physical and psychological strengths and weaknesses, select the threat's primary source of moral or physical strength, power, and resistance. Depending on the level (strategic, operational, and tactical), COGs may be tangible entities or intangible concepts. To test the validity of the COG, the question that needs to be asked is: "Will the destruction, neutralization, or substantial weakening of the COG result in changing the threat's COA or denying its objectives?" When possible, the J-2/G-2/S-2 identifies the COG. If these assets are unavailable, then an independent information environment may need to identify the COG. Typically this is the adversary's information position, which is a way of describing the quality of information an organization possesses and its ability to use that information.
- *Identifying critical capabilities.* Each COG is analyzed to determine what primary abilities (functions) the threat possesses in the context of the operational area and friendly mission that can prevent friendly forces from accomplishing the mission. Critical capabilities are not tangible objects; rather, they are threat functions. To test the validity of a critical capability, the questions that need to be asked are: "Is the identified critical capability a primary ability in context with the given missions of both threat and friendly forces? Is the identified critical capability directly related to the COG?" A critical capability is a means that is a crucial enabler for a COG to function and, as such, is essential to the accomplishment of the adversary's specified or assumed objectives.

Note. The adversary's critical capabilities are the functions in the information environment—collect, protect, and project.

- *Identifying critical requirements for each critical capability.* Each critical capability is analyzed to determine what conditions, resources, or means enable threat functions or mission. To test validity of a critical requirement, the questions that need to be asked are: "Will exploitation of the critical vulnerability disable the associated critical requirement? Does the friendly force have the resources to affect the identified critical vulnerability?"

Note. Critical requirements usually are tangible elements such as communications means, nodes, or key communicators.

- *Identifying critical vulnerabilities for each critical requirement.* Each critical capability is analyzed to determine which critical requirements (or components thereof) are vulnerable to neutralization, interdiction, or attack. As the hierarchy of critical requirements and critical vulnerabilities are developed, interrelationships and overlapping between the factors are sought to identify critical requirements and critical vulnerabilities that support more than one critical capability. When selecting critical vulnerabilities, a critical-vulnerability analysis is conducted to pair critical vulnerabilities against friendly capabilities.

Note. Critical vulnerabilities may be tangible structures or equipment, or intangible perception, populace belief, or susceptibility.

- *Prioritizing critical vulnerabilities.* The CARVER is a special operations forces methodology to prioritize targets. The methodology can be used to rank-order critical vulnerabilities, thereby prioritizing the targeting process. The six criteria are applied against the critical vulnerability to determine impact on the threat organization as follows:
  - *Criticality* is the estimate of the critical vulnerability importance to the enemy. Vulnerability will significantly influence the enemy's ability to conduct or support operations.

- *Accessibility* is the determination of whether the critical vulnerability is accessible to the friendly force in time and place.
- *Recuperability* is the evaluation of how much effort, time, and resources the enemy must expend if the critical vulnerability is successfully affected.
- *Vulnerability* is the determination of whether the friendly force has the means or capability to affect the critical vulnerability.
- *Effect* is the determination of the extent of the effect achieved if the critical vulnerability is successfully exploited.
- *Recognizability* is the determination if the critical vulnerability, once selected for exploitation, can be identified during the operation by the friendly force, and can be assessed for the impact of the exploitation.

5-21. The result of the analysis should determine the adversary's vulnerabilities that can be attacked by friendly-force IO capabilities. Figure 5-3, page 5-7, provides a visual depiction of the relationship between critical vulnerabilities.

5-22. In testing the validity of the COG analysis, leaders should apply the following questions:

- Will destruction, neutralization, or substantial weakening of the COG result in changing the threat's COA or denying its objective?
- Does the friendly force have the resources and capabilities to accomplish destruction or neutralization of the threat COG? If the answer is no, than the threat's identified critical factors must be reviewed for other critical vulnerabilities, or planners must reassess how to attack the previously identified critical vulnerabilities with additional resources.

ADVERSARY ACTIVITIES IN THE INFORMATION ENVIRONMENT

5-23. As part of determining the adversary's COA (Step 4 of IPOE), IO planners should determine how the threat employs its assets to operate in the information environment and achieve information superiority over U.S. forces. To be valid, this analysis should be developed in concert with, and integrated into, the intelligence staff's analysis.

5-24. To graphically depict an adversary's COA in the information environment, planners start with the CIO and then add why (likely information objectives and actions), where (location of primary information assets and means), when (a forecast of when the adversary will employ its assets), and how (the employment of capabilities) the adversary will seek information superiority. The result is a concept of the operation that describes how the adversary will operate in the information environment. In turn, this product can be used during mission planning.

CONSIDERATIONS

5-25. Intelligence that may be considered less-than-credible or insignificant to a traditional intelligence analyst can be key to an IO planner. Some examples include the following:

- *Perceptions.* Planners use the target audience's existing perceptions to their advantage. Knowledge and understanding of existing perceptions of the population, insurgent groups, and HN government and forces can provide IO opportunities to exploit to achieve desired effects or counter the adversary's exploitation. Gaps in understanding perceptions can be answered using MIS teams, CA teams, and during the conduct of key-leader engagements. Examples of perceptions to exploit or counter include—
  - An insurgent group that believes a mole exists within their organization (exploit).
  - The populace believes that insurgents are forcing U.S. forces out of bases (counter).
- *Rumors.* Planners use rumors as a method to achieve an effect. IO planners look for various fissures in organizations to exploit and shape perceptions. Examples are—
  - Mistrust or jealousy among individuals.
  - Greed or desire for power.

- *Sensitive-site exploitation.* Soldiers conducting sensitive-site exploitation, should observe the location and mentally record information that may not be of immediate tactical value but can be used by IO planners to better understand the information environment. Questions that Soldiers should ask include—
  - Is there a TV? What channel is it on?
  - Is there a radio? What station is it on?
  - Are there periodicals? If so, what type are they? What language?
  - Are there music compact discs? What type of music?
  - How much food is in the house? Is it more than necessary to support the family?

Appendix A

Planning Aids

This appendix provides multiple planning aids for Soldiers conducting IO missions. It outlines the duties and responsibilities of the IOWG and provides Soldiers with numerous mission analysis tools.

INFORMATION OPERATIONS WORKING GROUP

A-1. The IOWG brings together representatives of those staff elements concerned with the information operation. It is the most important meeting held by the assistant chief of staff, information operations (G-7)/information operations staff officer (S-7). The unit SOP should address the following for the working group:

- *Purpose.* The purpose of the IOWG is to synchronize the contributions of all staff elements to the work of the IO section.
- *Frequency.* The frequency of IOWGs depends on the situation and echelon. The working group may gather daily, weekly, or monthly, depending on the situation, echelon, and time available. Corps and division HQ may have daily (combat operations) or weekly (stability operations) IOWGs. Battalion and brigade HQ normally have fewer working groups than higher echelons.
- *Composition (chair and attendees).* The G-7/S-7 determines participation in the IOWG. It is a mix of staff-element representatives and subject-matter experts.
- *Inputs and outputs.* Attendees must know what information, products, and formats they are required to produce and use.
- *Agenda.* The formality of the IOWG also varies by echelon. For purposes of organization and focus, even the simplest IOWG should have an agenda.

COMPOSITION

A-2. The composition of the IOWG is tailored to the agenda. Representatives from every staff section need not attend each and every IOWG. Participants are selected because they either represent a critical element or capability, or have expertise that is critical to the IO. Core participants are staff members and subject-matter experts who regularly attend the IOWG due to their role in IO. Core participants include the following:

- IO personnel.
- MIS representatives.
- EW representatives.
- OPSEC representatives.
- COCAM representatives.
- CA representatives.
- PA representatives.
- MILDEC representatives.
- Representatives from the J-2/G-2/S-2.
- Representatives from the J-3/G-3/S-3, effects cell.
- Special technical operation planners.
- Fire support officer.
- Others, as required.

Page 3012 of 3957

A-3. There are other staff members who may not attend the IOWG on a regular basis, but whose role is no less important. They include the following:

- COMCAM officer in charge.
- G-6/S-6 representative.
- Cultural advisor.
- Chaplain.
- Political advisor.
- Subordinate-unit IO officers.
- Staff Judge Advocate representative.
- Liaison officers.

DUTIES AND RESPONSIBILITIES

A-4. Figure A-1 provides the duties and responsibilities of the IO working group members.

G-7/S-7	• Chair and facilitate working group. • Establish and enforce agenda. • Encourage active participation.
IO Capability Representatives	• Serve as subject-matter expert for their staff function or unit. • Provide input on capability status. • Provide input on current and future tasks and activities.
G-2/S-2 Representatives	• Provide intelligence relevant to IO. • Answer working group requests for information.
G-3/S-3 Representatives	• Provide input on current and future operations.
Subordinate Unit IO Representatives/Liaison Officers	• Serve as subject-matter expert for their unit. • Provide input on current and future missions, priorities, and tasks.
Recorder	• Record, write, and disseminate minutes of working group.
Other Participants	• Serve as subject-matter expert for their staff function or area of expertise. • Actively participate in the working group.

Figure A-1. Information operations working group duties and responsibilities

PREPARATION

A-5. Preparation is critical to a successful IOWG. A successful working group requires a collective effort from the IO section. For example, someone sets and prepares the agenda, another person notifies participants and ensures each is prepared to provide meaningful input to the working group, and another person prepares the IOWG presentation. Preparation tasks for the IWOG include the following:

- Set agenda.
- Notify participants:
  - Verify time and place of IOWG.
  - Identify additional participants.
- Review status of due-outs and contact those participants with due-outs.
- Coordinate with participants who have formal input.
- Publish a read-ahead packet:
  - If possible, provide IOWG materials to participants prior to the meeting.
  - Ensure participants provide input to IOWG presentation prior to the meeting.
- Assign a recorder to take minutes for the working group.

A-6. There are certain basics of meeting management that—if applied to the IOWG—can increase its effectiveness. Some basic suggestions include the following:

- Meet at established times and places.
- Keep meetings short—1 hour is a good rule of thumb.
- Have an agenda and follow it.
- Tailor working group membership to those people who are truly needed.
- Encourage participation by members; working groups are not one-way conversations.
- Complete detailed work and coordinate actions before the IOWG. Discuss actions and issues that are relevant to the working group.
- Identify and work critical issues. Identify and work side issues after the working group.
- Follow through on actions and due-outs. Record and track the results of the working group and publish minutes.
- Insist on timely delivery of due-outs and products.
- Invite subordinate and higher-command representatives.
- Give feedback to working-group members.

AGENDA

A-7. IOWG agendas vary by mission, situation, and echelon. A typical IOWG agenda includes the following:

- Roll call.
- Due-outs from previous IOWG.
- Intelligence update.
- Assessment update.
- Operations update.
- Discussion and issues.
- Review of due-outs.
- Conclusion.

A-8. Some IOWGs are organized along the lines of a targeting meeting, whereas others are similar to an operations meeting. Regardless of what agenda the IOWG takes, the purpose remains the same—to synchronize IO's contributing capabilities.

Due-Outs from Previous Working Group

A-9. Due-outs address unanswered questions or issues from the previous IOWG. Previous due-outs not answered during the IOWG should be carried over to the next IOWG for resolution. Typically, a due-out identifies the issue or question requiring resolution, and the person or element responsible for answering the due-out.

Intelligence Update

A-10. The purpose of the intelligence update is to answer current G-7 intelligence requirements. As such, it focuses on the information environment, the adversary's actions in the information environment, and the impact of those actions on friendly operations. Intelligence updates for IO should not be a regurgitation of other conventional intelligence updates. One way to structure the intelligence update is to capture significant events in the information environment and organize them by the G-7's intelligence requirements. Figure A-2, page A-4, provides a sample intelligence update format.

Assessment Update

A-11. The purpose of the assessment update is to assess the impact and effectiveness of current IO. Its focus is on analyzing and presenting information and intelligence from unit operations and intelligence reports, as well as input from the IOWG members. Figure A-3, page A-4, provides a sample of how the

assessment update can be depicted. Each operational area has a pie chart that represents the status of the current IO objectives (in this example there are five IO objectives).

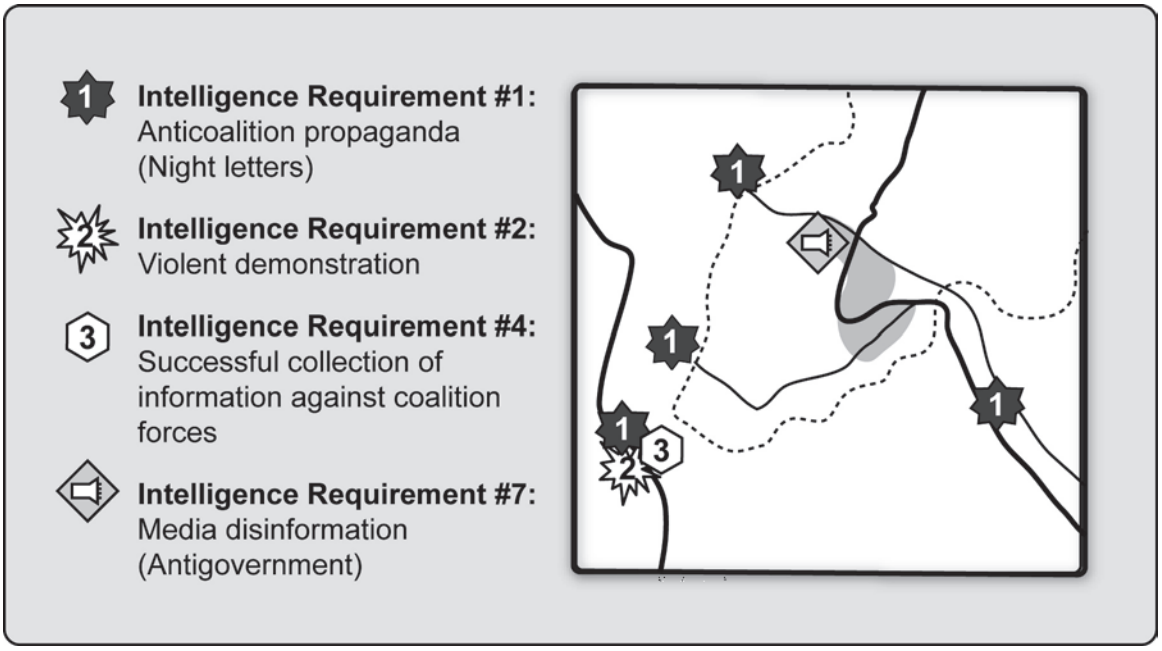

Figure A-2. Sample intelligence update format

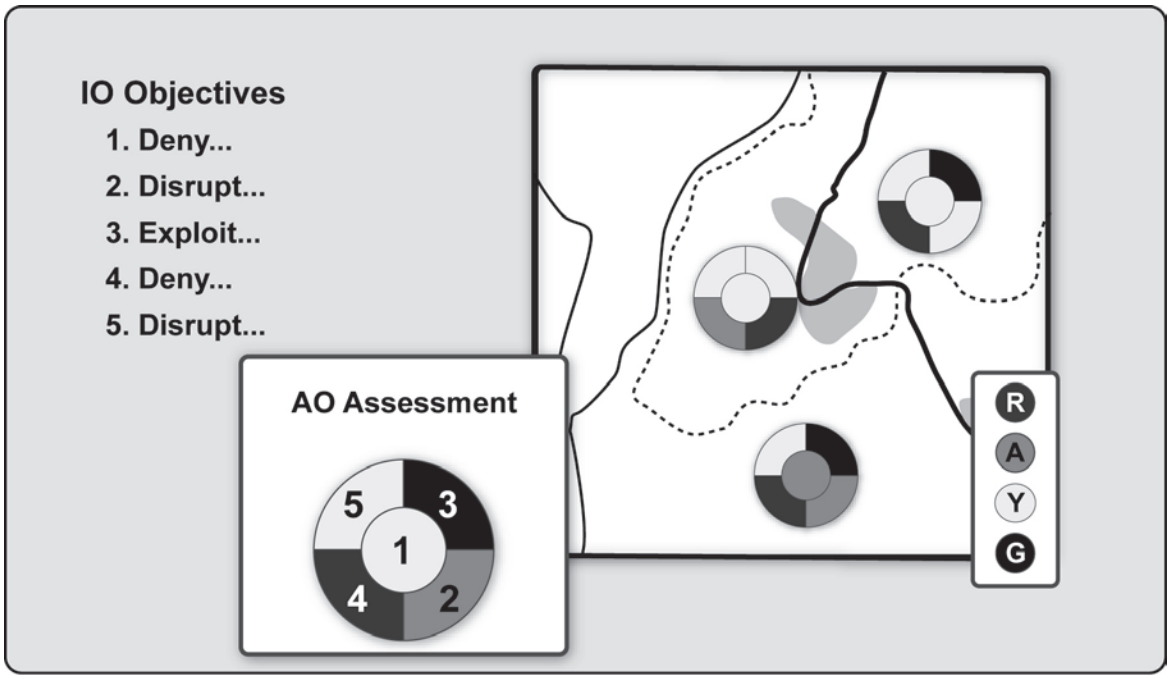

Figure A-3. Sample assessment update format

OPERATIONS UPDATE

A-12. The purpose of the operations update is to synchronize the IO objectives with element/capability tasks and targets for current and future (mid-range) IO. The focus is on gaining or maintaining information

superiority. One way to structure the operations update is to use graphics that show time, location, and purpose for key IO tasks for each major operation. Figure A-4 provides a sample format.

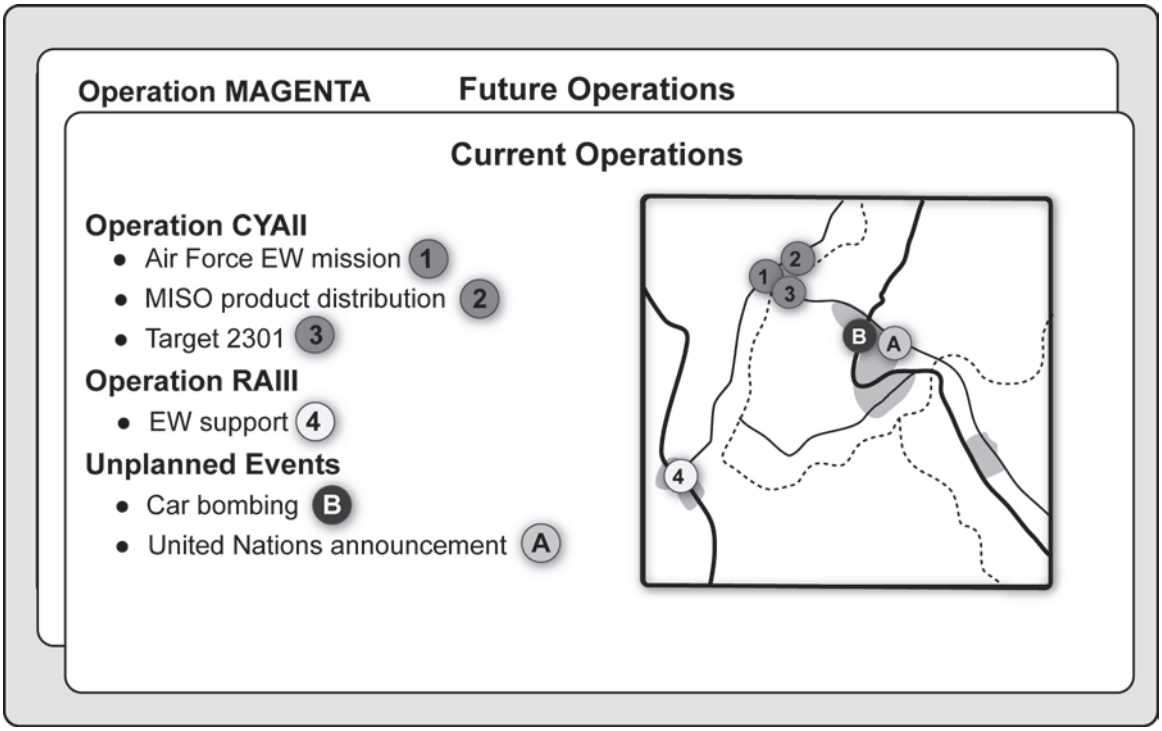

Figure A-4. Sample operations update format

Discussion and Issues

A-13. The purpose of the discussing issues or special topics is to support the G-7/S-7 decisionmaking and to synchronize the current and future activities of IO supporting capabilities. Discussion topics are selected by the G-7/S-7. Working-group participants have the opportunity (and responsibility) to discuss the topics from the perspective of their staff function or area of expertise. This discussion can be facilitated or focused by the use of an operations calendar (Figure A-5, page A-6) containing critical events and planned operations.

Review of Due-Outs

A-14. The purpose of reviewing due-outs is to ensure the working group participants understand and acknowledge their due-outs and responsibilities for the next meeting. Prior to final questions and comments, the G-7/S-7 reviews new due-outs identified during the working group as well as any open due-outs from the previous working groups. Each due-out should identify the issue or question requiring resolution, and the person or element responsible for answering the due-out.

Conclusion

A-15. The G-7/S-7 briefly discusses what the meeting accomplished and what working-group objectives were met. If necessary, side conversations, meetings, and other subworking groups are identified and scheduled.

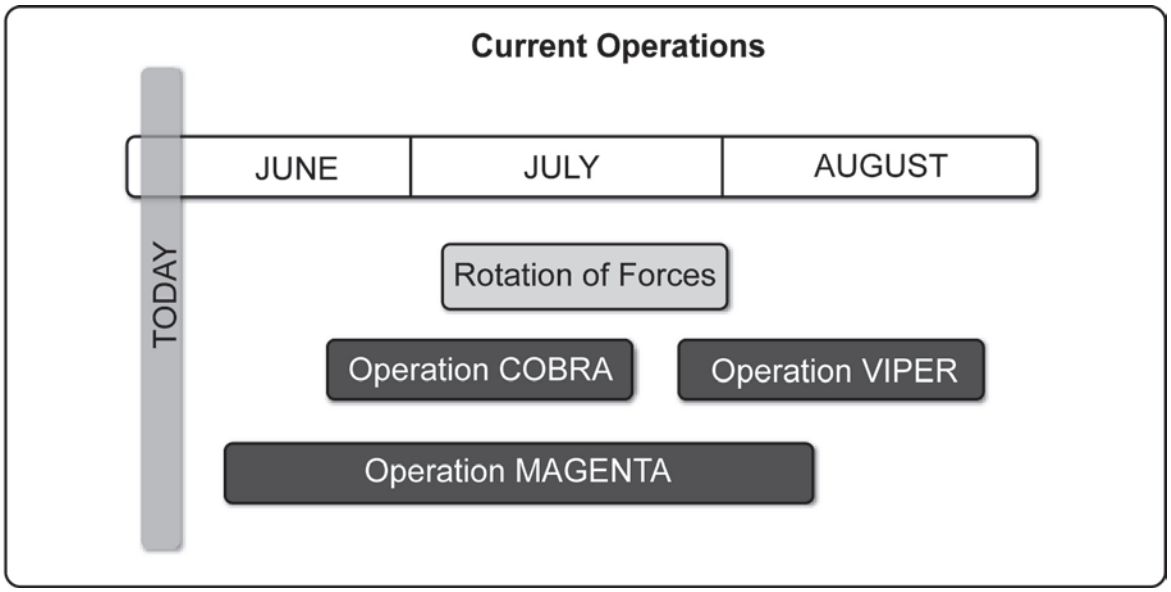

Figure A-5. Sample operations calendar

INFORMATION OPERATIONS PLANNING AIDS

A-16. Figure A-6 is an IO planning aid depicting the relationship between the military decisionmaking process and IO. Figure A-7, page A-7, depicts the relationship between IPOE and IO.

Military Decisionmaking Process Step	*Information Operations Focus*
Receipt of Mission	• Conduct initial assessment of information operation. • Determine IO planning requirements.
Mission Analysis	• Understand IO situation. • Analyze the higher HQ IO. • Define and analyze the information environment and threat. • Develop IO mission statement and objectives. • Seek commander's IO guidance.
COA Development	• Identify friendly IO capabilities and vulnerabilities. • Develop IO concept of support.
COA Analysis	• Visualize operations in the environment. • War-game IO concept of support against how the enemy will employ its information systems and assets.
COA Comparison	• Analyze and evaluate IO support to each COA.
COA Approval	• Finalize details of the information operation.
Orders Production	• Prepare IO annex and input to base operation order/operation plan.

Figure A-6. Information operations planning aid

A-17. The purpose of performing a COG analysis (Figure A-8, page A-7) is to determine and evaluate the adversary's critical vulnerabilities for exploitation. Because this tool is used to evaluate the adversary, the appropriate time to perform this analysis is during Step 3 (evaluate the threat) of IPOE.

A-18. In testing the validity of the COG analysis, leaders should apply the following questions:

- Will destruction, neutralization, or substantial weakening of the COG result in changing the threat's COA or denying its objective?
- Does the friendly force have the resources and capability to accomplish destruction or neutralization of the threat COG? If the answer is no, then the threat's identified critical factors must be reviewed for other critical vulnerabilities, or planners must reassess how to attack the previously identified critical vulnerabilities with additional resources.

Intelligence Preparation of the Operational Environment Steps	*Information Operations Focus*	*Analysis Product*
Define the operational environment.	Define the information environment.	Combined information overlay—significant characteristics of the information environment and effects on operations.
Describe the operational environment's effects.	Describe the information environment's effects.	
Evaluate the threat.	Evaluate the threats' information system.	• Threat COG analysis—critical vulnerabilities. • Threat templates—who makes decisions; what nodes, links, and systems the threat uses; how information assets are employed.
Determine threat COAs.	Determine threat actions in the information environment.	Information situation template—when, where, and why the threat will seek to gain information superiority.

Figure A-7. Relationship between intelligence preparation of the operational environment and information operations

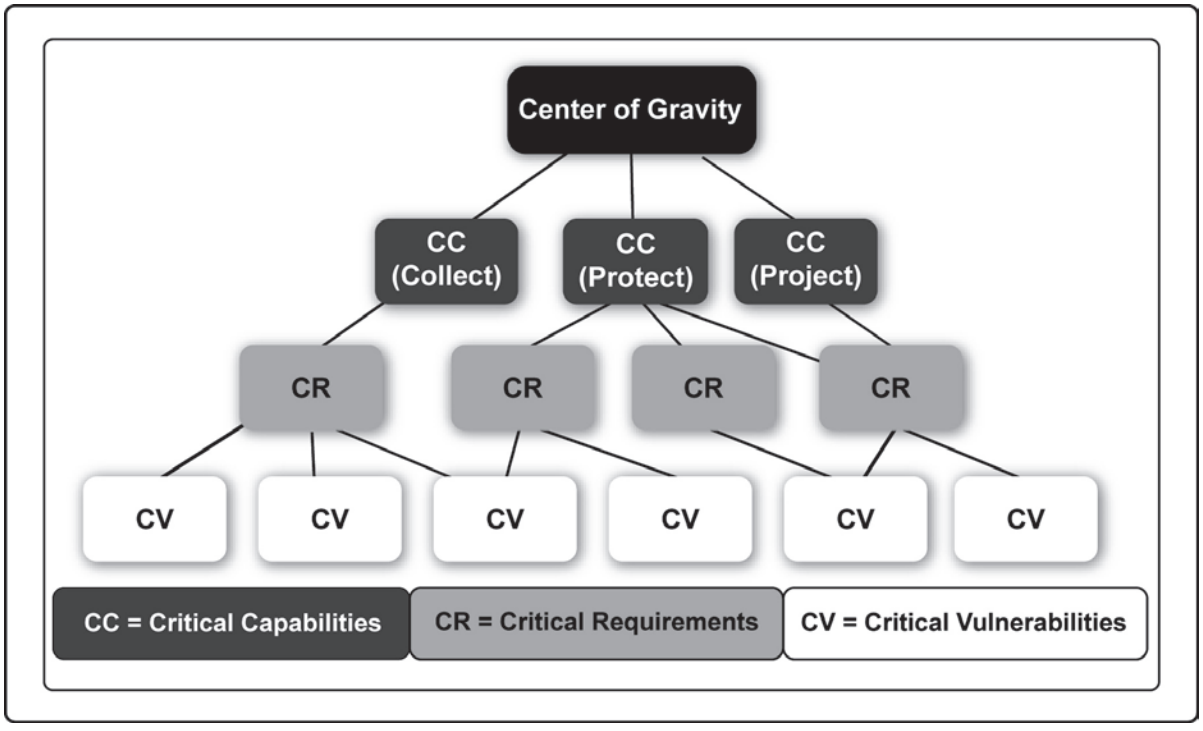

Figure A-8. Sample center-of-gravity analysis

A-19. Figure A-9, page A-9, is a sample combined information overlay. Figure A-10, page A-9, depicts a sample IO mission-to-task product chart. Figure A-11, page A-10, depicts a sample IO mission and tasks (tactical level). Figure A-12, page A-10, depicts a sample COA sketch.

A-20. In addition to doctrinal effects, IO have a number of nondoctrinal effects, to include the following:

- *Destroy.* This renders a target so damaged that it cannot function as intended nor be restored to a usable condition without being rebuilt.
- *Degrade.* This reduces the effectiveness or efficiency of adversary information systems, assets, or functions.
- *Disrupt.* This temporarily interrupts the flow of information.
- *Deceive.* This misleads or manipulates adversary understanding of friendly forces' activities, capabilities, vulnerabilities, and intentions.
- *Influence.* This affects an adversary or others perceptions, attitudes, and behavior to support friendly-force objectives.
- *Preserve (nondoctrinal).* This maintains the effectiveness or efficiency of friendly-force information systems, assets, or functions (related to doctrinal effect *protect*).
- *Deny.* This hinders or prevents an adversary and others from gaining access to, collecting, or using information concerning friendly forces.

A-21. Possible IO tasks include the following:

- Control.
- *Counter.*
- Counter-reconnaissance.
- Defeat.
- Delay.
- *Demonstrate.*
- Destroy.
- *Deter.*
- *Engage.*
- Fix.
- *Inform.*
- Interdict.
- Isolate.
- *Jam.*
- Neutralize.
- *Persuade.*
- *Prevent.*
- *Protect.*
- Secure.
- Suppress.

Note. Italicized tasks are proposed IO tactical tasks.

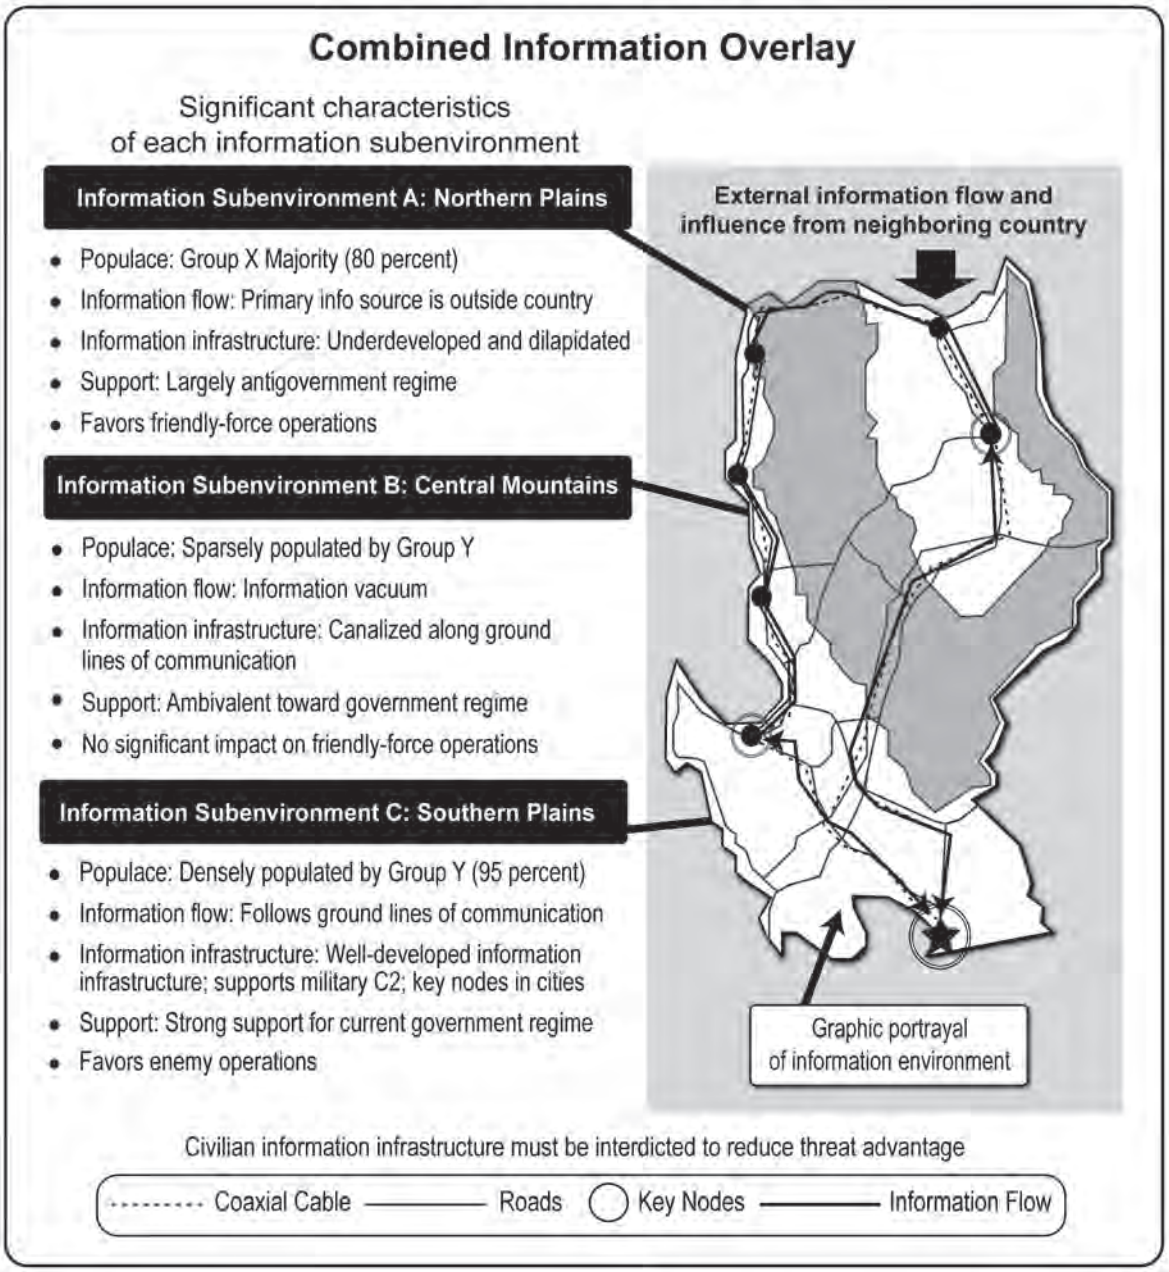

Figure A-9. Sample combined information overlay

Mission	*Tasks Products*
IO Mission Statement	How IO will support the command's mission (who, what, where, when, why).
IO Objectives (3 to 5 Objectives per Phase)	What IO will do to affect the information environment (effect, object of the effect [target], purpose of the effect).
Tasks to IO Elements	What actions the elements will perform to execute the information operations (task, purpose).
Tasks to Units	Task, purpose.
IO Concept of Support	How the information operation will be conducted (commander's intent for IO, information superiority for the operation, general plan for IO, priority).

Figure A-10. Mission-to-task products

IO Mission: On order, the friendly force disrupts the enemy ground and air defense forces' C2, influences civilian populace perceptions, and protects Corps' critical information in the AO to facilitate destruction of 1st Operational Strategic Command forces.

IO Objectives:

- Disrupt the enemy force's air defense C2 to prevent coordinated engagement of the friendly force's deep attacks.
- Disrupt operational reserve command posts and communication networks to delay employment of reinforcing or counterattack forces.
- Influence civilian populace in occupied areas to minimize interference with the friendly force's operations.
- Deny detection and identification of the friendly force's main and tactical command posts to prevent targeting by the enemy force's artillery fires.

Figure A-11. Sample information operations mission and tasks (tactical level)

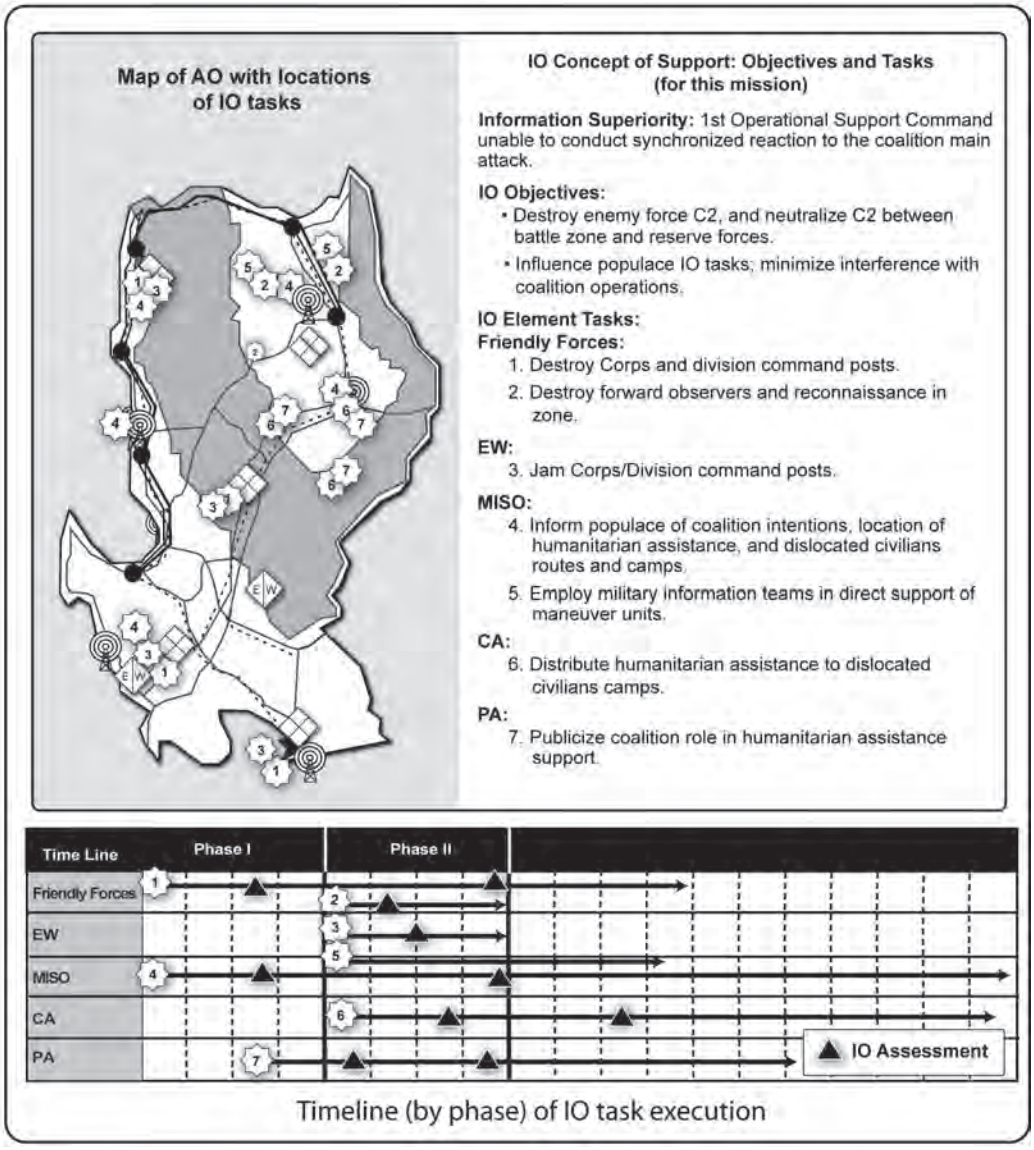

Figure A-12. Sample course-of-action sketch

MISSION ANALYSIS AND INFORMATION OPERATIONS

A-22. As part of the planning process, the IO staff must conduct its own mission analysis. Figure A-13 depicts the relationship between IO and mission analysis.

Military Decisionmaking Process Step	*Information Operations Focus*
Analyze Higher HQ Order	Analyze the higher HQ IO.
Perform IPOE	Define information environment and determine threat COAs.
1. Determine Tasks	Determine what the IO must do.
2. Review Available Assets	Determine organic and support IO capabilities.
3. Determine Constraints	Determine constraints on information content and flow.
4. Identify Facts and Assumptions	Identify facts and assumptions relevant to information content, flow, and use.
5. Perform Risk Assessment	Input hazards resulting from IO tasks.
6. Determine CCIR and EEFI	Determine EEFI.
Determine Intelligence, Surveillance, and Reconnaissance Plan	Input information requirements for IO.
Update Timeline	Input lead time for IO tasks.
Write Restated Mission	Write IO mission statement (if used).
7. Deliver Mission-Analysis Briefing	Input to mission-analysis briefing.
Approve Restated Mission	Approve IO mission statement (if used).
Develop Commander's Intent	Input to commander's intent.
Issue Commander's Guidance	Issue guidance for IO.
Issue Warning Order	Input for IO.
Review Facts and Assumptions	Address changes to IO planning factors.

Figure A-13. Mission analysis and information operations

A-23. Figure A-14, page A-12, provides a sample mission-analysis work sheet. The mission-analysis work sheet—

- Provides a tool to conduct mission analysis.
- Focuses on the minimum information needed for a plan.
- Follows the sequence of the mission-analysis briefing format, not the steps of mission analysis.

A-24. Identify specified and implied tasks to IO; not tasks to the capabilities. Tasks to the capabilities may be a constraint because they allocate resources away from the IO. Specified tasks are tasks specifically assigned to a unit by its higher HQ. Implied tasks are tasks that must be performed to accomplish a specified task or the mission, but are not stated in the higher HQ order.

A-25. IO tasks ignore staff coordination, administrative, and SOP tasks (for example, conducting a weekly IOWG, or submitting daily reports). Leaders organize identified specified and implied tasks to improve clarity. Tasks may be divided into two categories—

- Tasks to shape the information environment and to engage enemy forces.
- Tasks associated with information flow and information content.

A-26. Essential tasks are specified or implied tasks that must be executed to accomplish the mission. Leaders select three to five essential tasks, which are approved by the commander during the mission-analysis briefing.

1. **Facts:** Situation remains that the enemy will continue to use improvised explosive devices, small-unit attacks, and ambushes to attempt to gain strength for its cause. Friendly forces will continue to find and engage the enemy to eliminate improvised explosive devices. Current strength remains at 90 percent. Troops in the area of operations remain on the offensive and material readiness remains at 90 percent.
2. **Assumptions:** Attacks will continue to increase as the weather continues to improve, allowing for more insurgents and better leadership. This has been the pattern over the last several years and by all indications will continue.
3. **Tasks:** a. Specified: Detachments within the area of operations will continue to hunt for suspected insurgents and find, fix, capture, or eliminate as situation dictates. Additionally, detachments will continue to provide support to coalition forces and provide humanitarian support to the host nation. b. Implied: Continue offensive operations against insurgents. Continue to provide operational support to coalition forces and provide humanitarian support and security for the host nation. c. Essential: Provide for security and protect essential elements of friendly information. Provide training support to host-nation and coalition forces and conduct offensive operations to deter and eliminate insurgent activities in concert with collation partners.
4. **Constraints:** Close air support is authorized in rural areas. The use of close air support in urban areas must be approved by regional commander. Cultural support team will interrogate women and children only and detachments will provide security, as applicable.
5. **Available Assets:** All organic detachment equipment will be used, to include combat controllers, interpreters, Civil Affairs teams, Military Information Support teams, provincial reconstruction teams, and coalition support. Current rules of engagement remain in effect. Avoid using themes that will denigrate host-nation forces, such as cultural and religious themes. All releases to the media must first be approved by the public affairs office.
6. **Risk Assessment:** Improvised explosive devices will remain a constant threat. Weather conditions will hamper aviation and air support.
7. **CCIR:** In order to maintain the offensive, the commander needs to know current situational status and personnel status for both U.S. and coalition forces. a. PIR: Commander needs a clear and concise understanding of the enemy strengths and weaknesses; the disposition of forces and key leaders. b. FFIR: Commanders need a clear and concise understanding of coalition and friendly forces within the area of operations—specifically, which units are available to support detachments if needed, to include other ongoing operations within the detachment area of operations.
8. **EEFI:** Protection of intelligence requirements. Mission of higher and friendly forces within the area of operations, infiltration and exfiltration routes, unit strength, and communications must be protected.

Figure A-14. Example of a mission-analysis work sheet

Review Available Assets

A-27. Leaders examine available assets to determine IO capabilities and limitations, considering both organic and supporting assets based on current task-organization, support relationships, and status of units. Assets are compared to specified, implied, and essential tasks to determine if there are enough assets to accomplish all tasks. It may be useful to translate assets into IO capabilities (effects and targets). Figure A-15, page A-13, provides a sample matrix to help in this comparison.

Organization	*Asset*	*Means*	*Supported Essential Task*	*Effect*	*Target*
Organic Assets					
Tactical Psychological Operations Company	1 x Product Development Detachment 9 x Tactical Psychological Operations Teams	Face-to-face Loudspeaker Handbills Posters Radio Television	N/A	Influence Inform Deceive	Local populace
Military Intelligence Company	3 x Prophet	Electronic attack	N/A	Disrupt	Enemy communication
Civil Affairs Battalion	12 x Tactical Support Teams	Face-to-face Humanitarian assistance Medical assistance Reconstruction projects	N/A	Influence Inform Co-opt	Local civilian leaders Local populace
Supporting Assets					
CFACC	EA6B EC130	Electronic attack Electronic support	Disrupt Degrade Destroy Inform Influence		Division-level communications Corps-level communications

Figure A-15. Example of an information operations asset/capability matrix

DETERMINE CONSTRAINTS

A-28. Constraints are restrictions on the use and employment of IO. The two types of constraints are prohibited actions (cannot do) and directed actions (must do; that is, resources and assets are required to do something). Constraints affect the use of IO capabilities and may be found in base orders, annexes, and appendixes. Constraints may be organized by affect on information content and flow (Figure 3-4, page 3-6).

FACTS AND ASSUMPTIONS

A-29. Facts and assumptions establish an understanding of the situation. Facts are known data concerning the situation. Assumptions are accepted as true in absence of facts. Leaders focus on facts and assumptions that concern assigned tasks. Figure A-16, page A-14 provides a sample fact and assumption analysis. Facts and assumptions may be organized as follows:

- Information environment (content and flow).
- Adversary capabilities and vulnerabilities in the information environment.
- Friendly capabilities and vulnerabilities in the information environment.

Information Environment	• Local populace is illiterate. (Fact) • Radio primary means to reach populace. (Fact) • Populace is pro-United States. (Fact) • Local leaders can control populace behavior. (Assumption)
Adversary Forces	• SIGINT is limited to short-range very high frequency radio. (Fact) • Use satellite and cell phones for C2. (Fact) • Will direct adversary information against U.S. forces. (Assumption)
Friendly Forces	• Friendly forces can jam the enemy's C2. (Fact) • Friendly forces can use local radio stations. (Assumption)

Figure A-16. Example of a fact and assumption analysis

RISK ASSESSMENT

A-30. Leaders identify and assess risks in the information environment arising from the essential tasks for IO. Risk assessment has five steps:

- Identify hazards (accomplished during mission analysis).
- Assess hazards (accomplished during mission analysis).
- Develop controls.
- Determine residual risk.
- Implement controls.

A-31. IO planners identify two kinds of hazards (risks). Tactical risk is concerned with hazards that exist because of the presence of the enemy or adversary. Accidental risk includes risks to friendly forces, to civilians, and the operation's impact on the environment.

INPUT TO COMMANDER'S CRITICAL INFORMATION REQUIREMENT

A-32. The CCIR identifies the information needed for direct execution of the mission. There are two types of CCIRs—PIRs and FFIRs:

- PIRs are information the commander must know about the enemy. For IO, PIRs focus on conditions in the information environment and threat actions to affect the information environment.
- FFIRs are information the commander must know about the friendly force. For IO, FFIRs focus on the friendly force's capability to shape information content and flow.

ESSENTIAL ELEMENTS OF INFORMATION

A-33. EEFI is information that must be protected from the adversary's intelligence system. Sources of information for developing EEFI are commander's guidance, facts, assumptions, and essential-task lists, and the intelligence estimate (information about adversary intelligence capabilities and requirements). EEFIs are written as statements, not questions; otherwise, EEFI may be confused with PIRs. Figure A-17, page A-15, provides an example.

PIR	• What information systems is the adversary using for C2? • What means is the enemy using to disseminate propaganda? • Is adversary information turning popular opinion against operations?
FFIR	• Media coverage of alleged friendly force's misconduct. • Civilian casualties caused by friendly-force operations.
EEFI	• Friendly force's means of intelligence collection. • Tribal leaders who are assisting friendly forces.

Figure A-17. Example of a commander's critical information requirement and essential elements of information for information operations

MISSION-ANALYSIS BRIEFING

A-34. The IO portion of the briefing is included either in the G-3 and G-2 planners' presentations or, when appropriate, developed as separate slides. IO input typically includes the following:

- *Mission.* Commander's intent for IO of HQ two levels up and own commander's IO guidance.
- *IPOE.* CIO and enemy COAs in the information environment.
- *Facts and assumptions.* Critical facts and assumptions for IO.
- *Tasks.* Specified, implied, and essential tasks for IO.
- *Constraints.* Restrictions on the use and employment of IO.
- *Forces available.* Organic and supporting IO-capable assets and their capabilities and limitations.
- *Risk assessment.* Risks in the information environment.
- *CCIR.* Input to PIR, FFIR, and EEFI.
- *Timeline.* Input to the time allocation plan for accomplishment of IO essential tasks.
- *Restated mission.* IO mission statement (if used).

INFORMATION ENVIRONMENT CONSTRUCT

A-35. Figure A-18 depicts the different dimensions of the information environment and their key characters.

Information Environment Dimensions	*Key Characteristics*
Cognitive • Individual and collective consciousness • Where decision are made	• Beliefs • Values • Perceptions • Awareness • Decisionmaking
Information • Intersection of physical and cognitive dimension • Where information is created and exists	• Information content • Information flow • Information functions—collect, project, protect
Physical • The physical world—land, sea, air, and space • Where information systems and networks reside	• Technological information systems, Internet, media • Human—societal organization, military formations, third-party organizations

Figure A-18. Information environment

DEFINE INFORMATION ENVIRONMENT

A-36. Leaders define the information environment by examining the AO to identify the following significant characteristics of the cognitive, information and physical dimensions:

- *Terrain.* Canalization and compartmentalization.
- *Civilian information infrastructure.* Key links and nodes.
- *Media.* Radio, TV, print, and Internet, including audiences.
- *Civilian population:*
  - Demographics, such as distribution, language, religion, ethnicity, and education.
  - Cultural factors, such as societal structures, ideologies, perceptions, and beliefs.
- *Third-party organizations.* Nongovernmental organizations, private organizations, criminal organizations.

A-37. The information environment variances by level of war are depicted in Figure A-19.

Tactical	Physical	• Terrain and weather. • Local information systems. • Face-to-face contact.
	Information	• Line-of-sight flow. • Content addresses immediate needs.
	Cognitive	• Immediate perceptions and behavior.
Operational	Physical	• Regional information systems.
	Information	• Over-the-horizon flow. • Content addresses higher-level issues and concepts.
	Cognitive	• Near-term group perceptions and behavior.
Strategic	Physical	• Mass, long-distance information systems.
	Information	• Global flow. • Content addresses abstract ideas, ideologies, and philosophies.
	Cognitive	• Long-term perceptions and beliefs.

Figure A-19. Information environment variances by level of war

DESCRIBE THE INFORMATION ENVIRONMENT'S EFFECTS

A-38. Leaders analyze each significant information environment characteristic in detail and plot the data in a template (such as the sample provided in Figure A-20, page A-17).

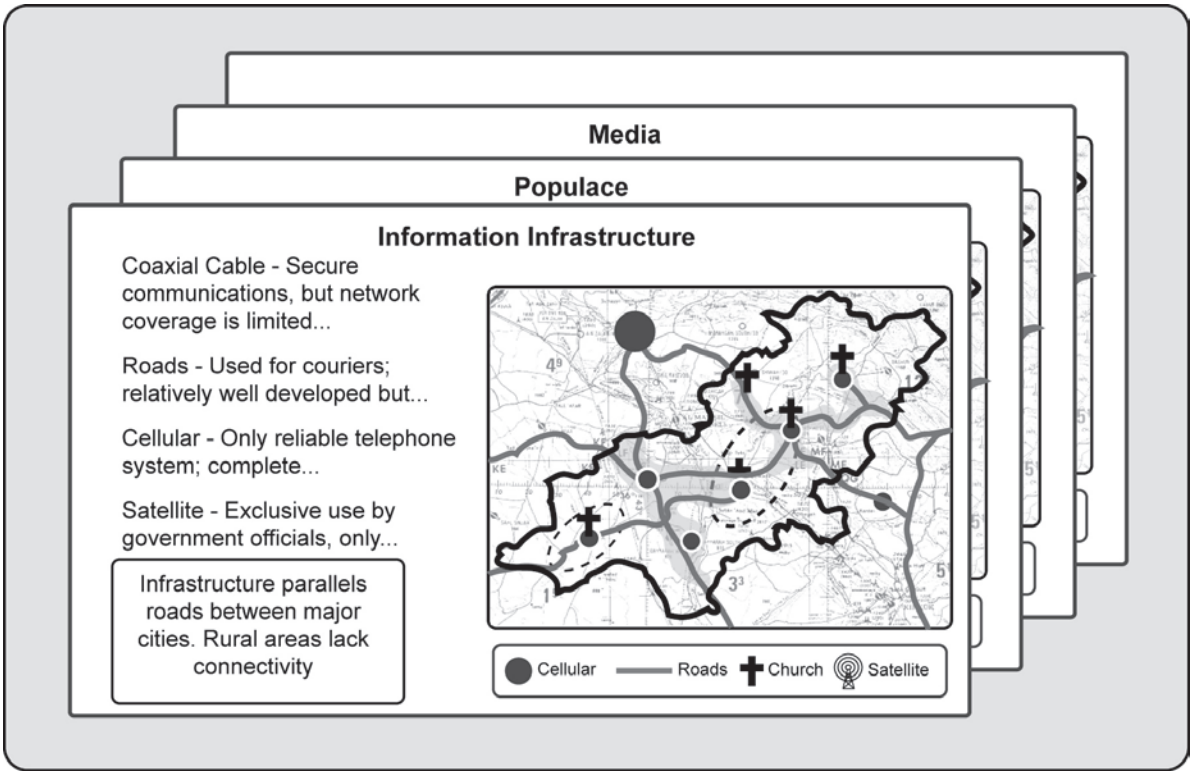

Figure A-20. Sample information environment effects matrix

Describe Subinformation Environment and Key Nodes

A-39. By identifying and acting on key nodes, a military force can affect the information environment. Subinformation environments are areas in which the information environment's characteristics and effects are notably different from those of adjacent areas. Subinformation environments—

- Are determined by physical features and cognitive aspects of the information environment.
- Are formed by interactions of physical and cognitive dimensions.
- Determine an advantage to the friendly or adversary force.

A-40. Information nodes are key terrain in the information environment. Information nodes are places, persons, or infrastructures that shape information content and flow by creating or transmitting information. Information nodes—

- Exist in each subinformation environment.
- Can be human, technological, or both.
- Are located at the center of information content and flow.
- Critically affect information flow and content.
- Provide an advantage to one side or the other.

Combined Information Overlay

A-41. The CIO is a graphic depiction of where and how the information environment's effects will impact military operations. Figure A-21, page A-18, provides a template for a CIO. Figure A-22, page A-19, provides a sample CIO. The CIO—

- Depicts subinformation environments and key nodes.
- Describes information flow in the operating area.
- Includes a "so what" analysis.

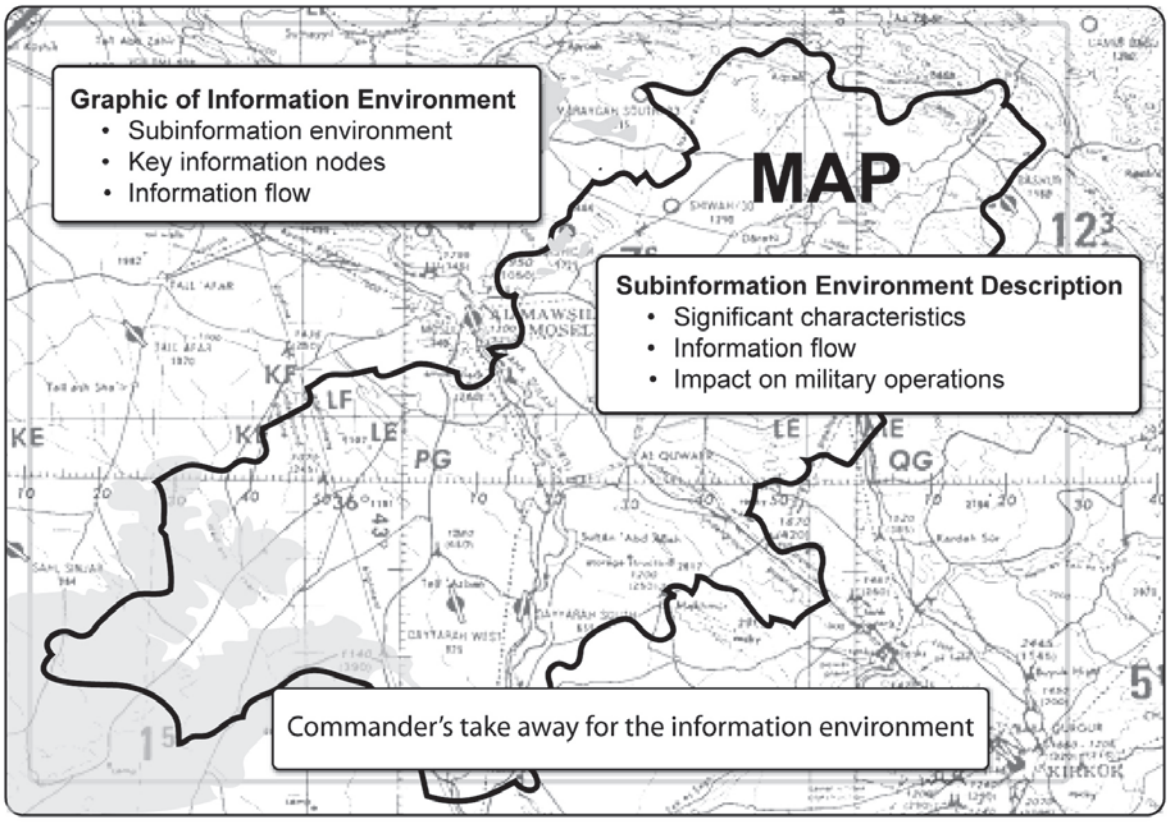

Figure A-21. Combined information operations overlay template

EVALUATE THE THREAT—CENTERS OF GRAVITY

A-42. The purpose of performing a threat COG analysis is to determine and evaluate the enemy's (and others') critical vulnerabilities for exploitation. Because this tool is used to evaluate the threat, the appropriate time to perform this analysis is during step 3 (evaluate the threat) of IPOE. The results of COG analysis are later used during COA development to exploit identified vulnerabilities. Chapter 5, Templating Using Center-of-Gravity Analysis, page 5-7, provides additional information.

A-43. The COG analysis of the threat should be conducted by the G-2. The IO staff will provide input to the COG analysis and use it to determine what aspects of the threat IO should engage. Figure A-23, page A-20, provides a graphical depiction of where the COG analysis falls into the military decisionmaking process.

EVALUATE THE THREAT—TEMPLATING

A-44. More formal modeling produces templates that portray the normal or doctrinal (historical) composition and organization of the adversary's information system and its assets. The result should identify adversary capabilities and vulnerabilities under ideal conditions in the information environment. Templates will vary widely by operation—the examples provided are illustrative only.

Decisionmaking Template

A-45. The decisionmaking template identifies who makes decisions. Its purpose is to identify key leaders, organizational structures, linkages and interrelationships, key decisionmakers, and decisionmaking characteristics. Figure A-24, page A-20, provides a sample decisionmaking template.

Information Infrastructure Template

A-46. The information infrastructure template identifies what assets and means the adversary uses to collect, protect, and project information. The template identifies critical adversary information system nodes, links, and systems (to include those assets capable of impacting the information environment). Figure A-25, page A-21, provides a sample information infrastructure template.

Information Tactics Template

A-47. The information tactics template identifies how the adversary will collect, protect, and project information. It identifies adversary tactics, past use of information, and available assets. Figure A-26, page A-21, provides a sample information tactics template.

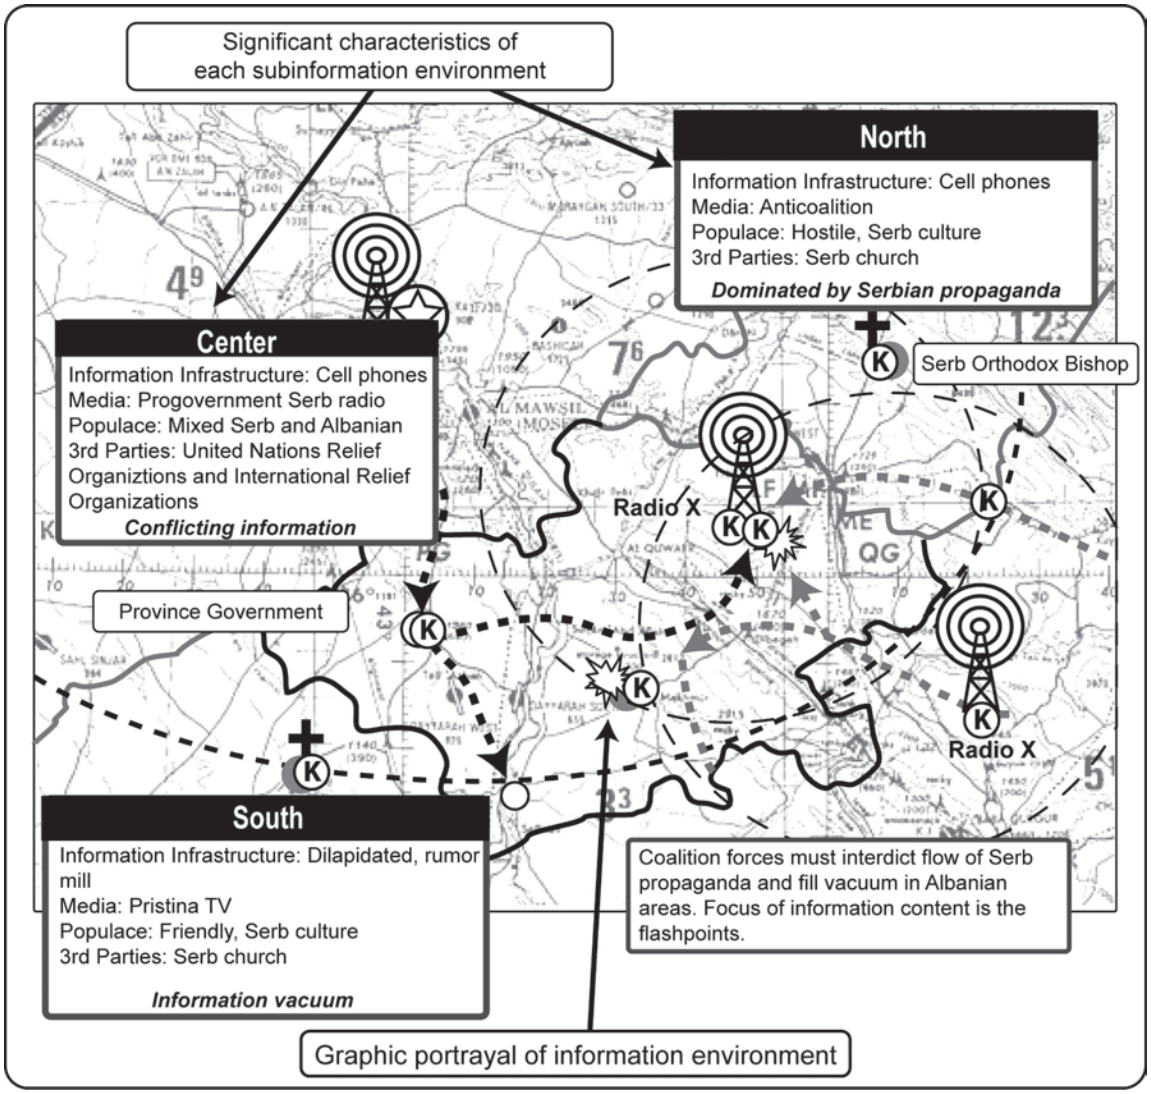

Figure A-22. Example of a combined information operation

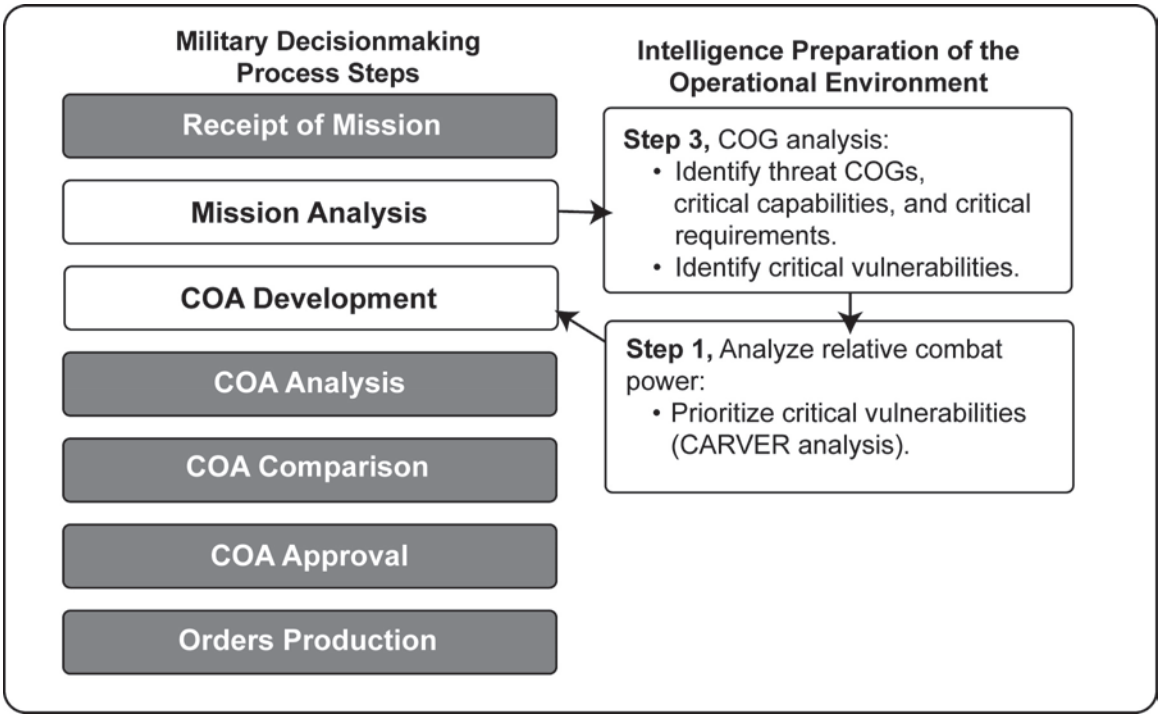

Figure A-23. Relationship between center-of-gravity analysis and the planning process

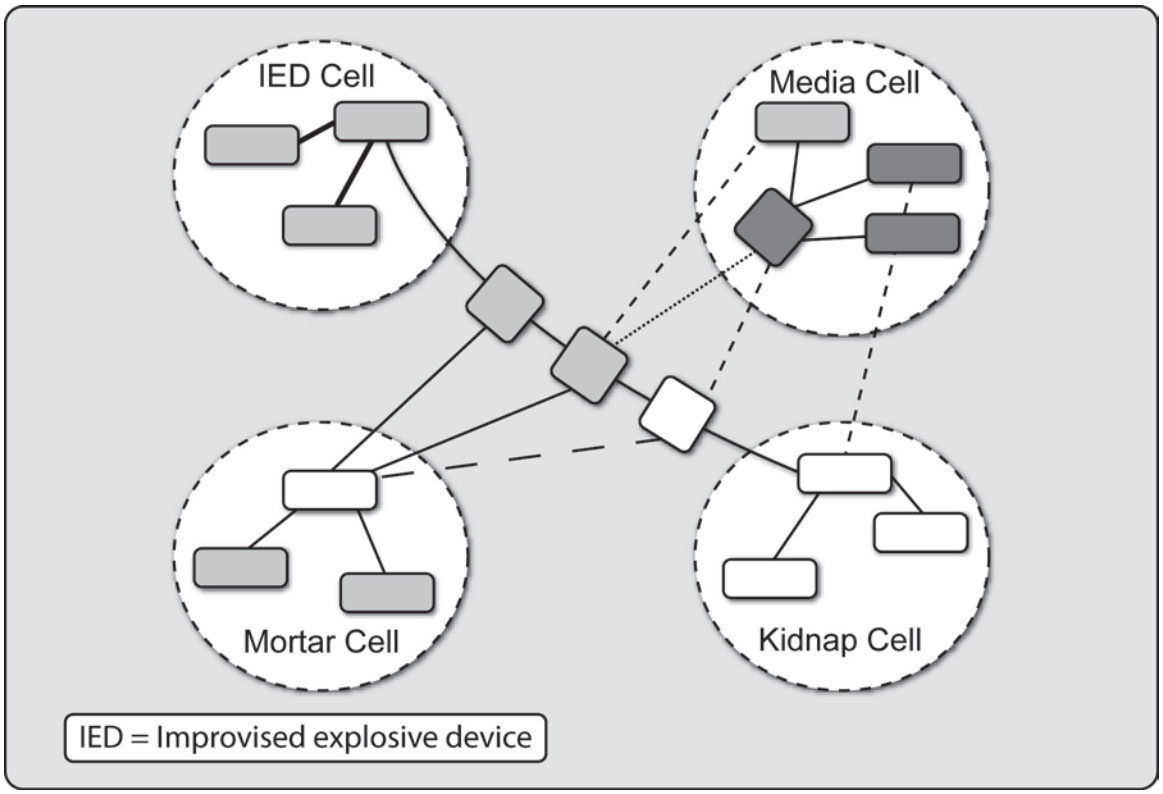

Figure A-24. Decisionmaking template

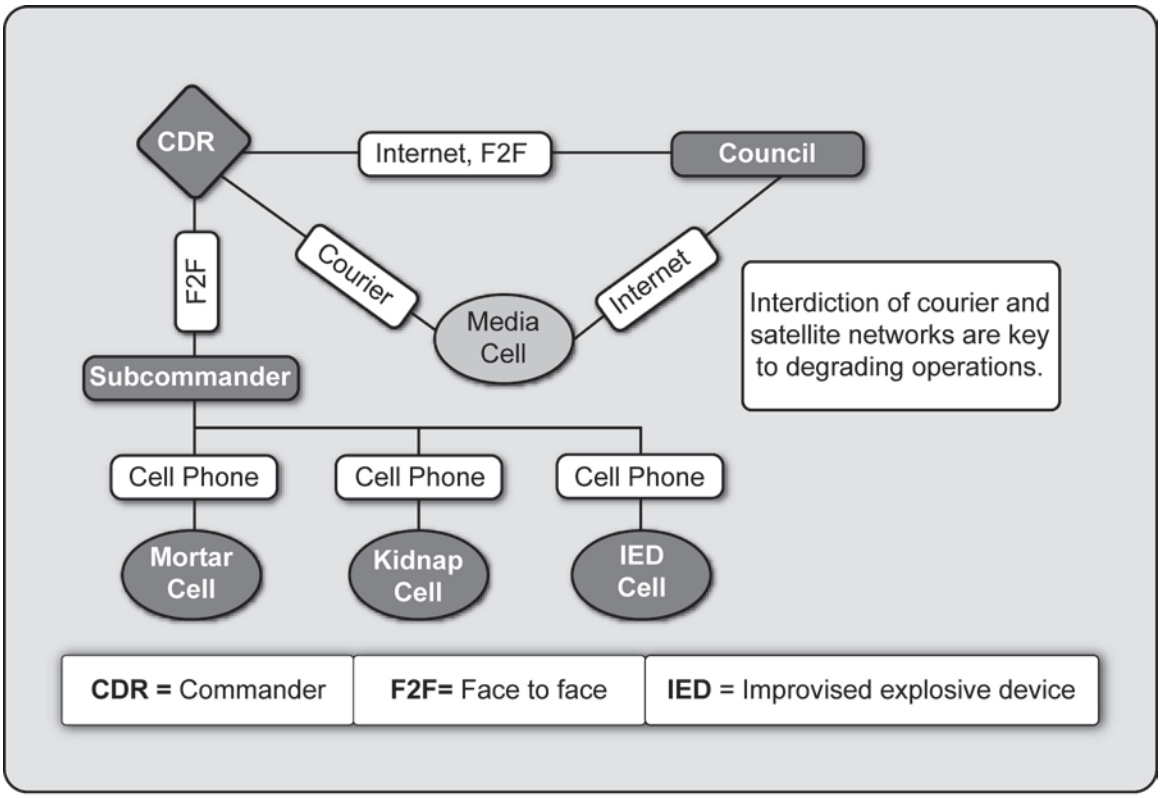

Figure A-25. Information infrastructure template

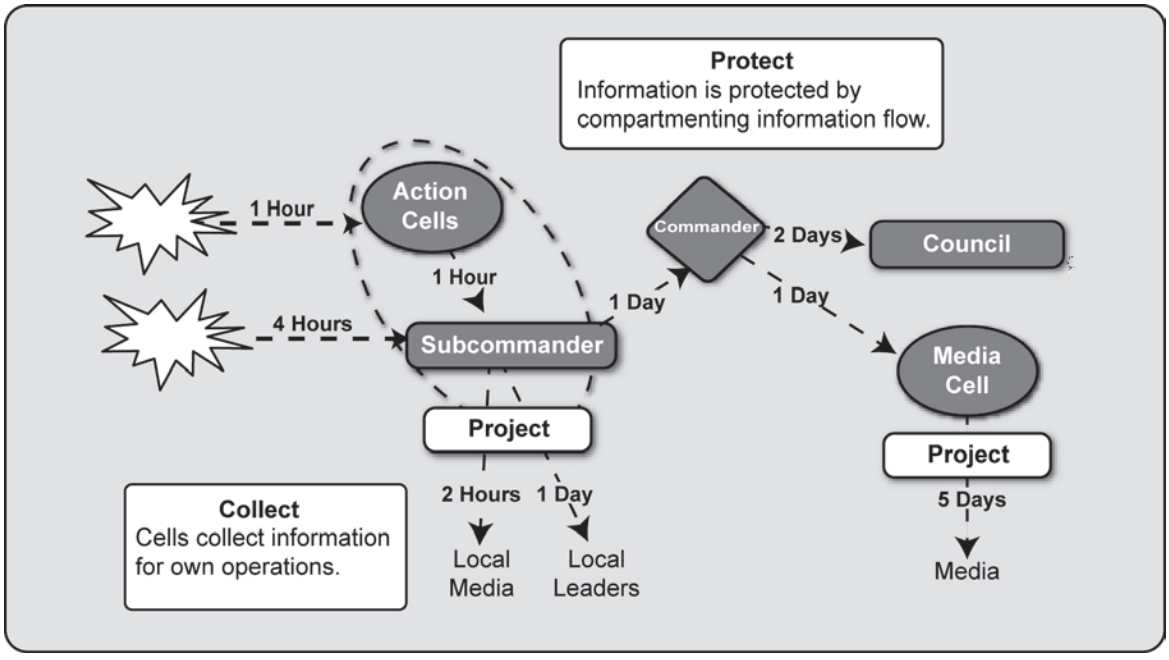

Figure A-26. Information tactics template

DETERMINE THREAT ACTIVITIES IN THE INFORMATION ENVIRONMENT

A-48. The information situation template identifies where, when, and why the adversary will seek information superiority. The result is a concept of operations that describes how the adversary will operate in the information environment. Figure A-27 provides a sample information situation template.

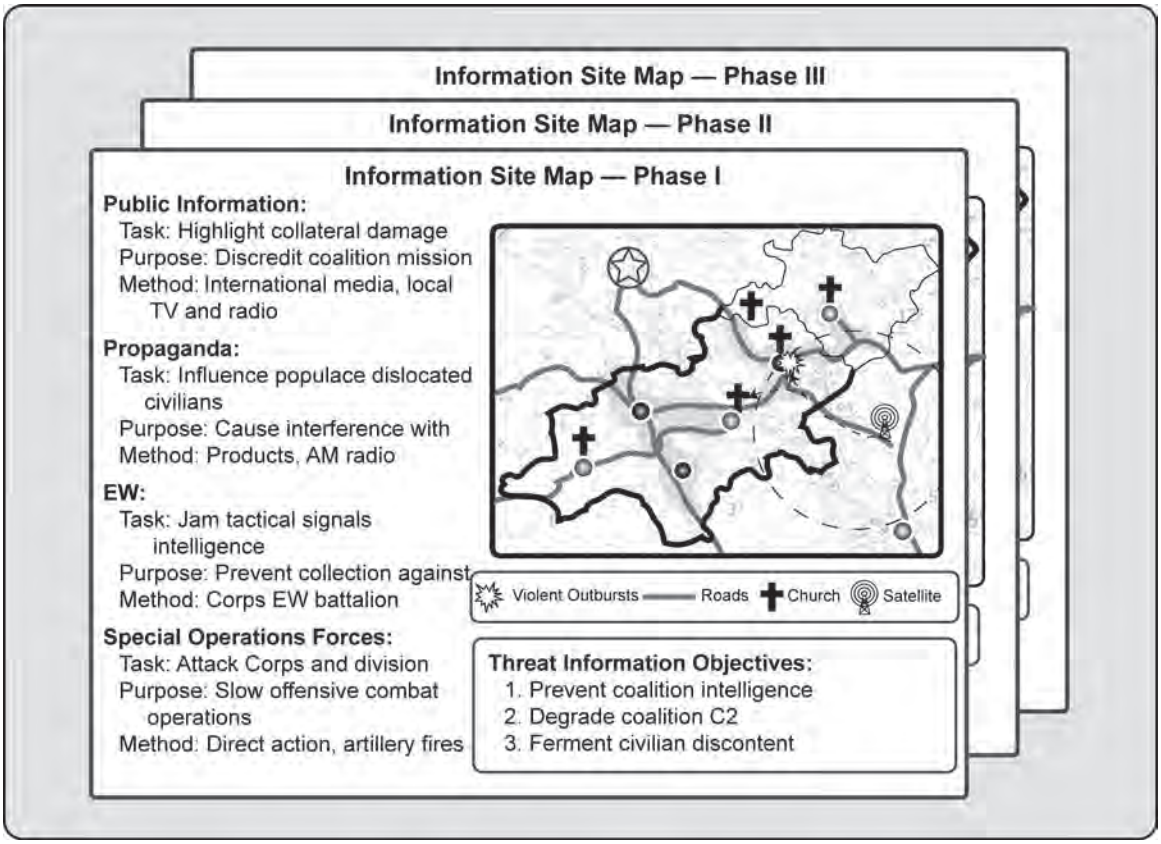

Figure A-27. Information situation template

STAFF ESTIMATE FOR INFORMATION OPERATIONS

A-49. The staff estimate is an assessment of the situation and an analysis of the COAs the commander is considering. The estimate includes an evaluation of how factors in a staff section's functional area influence each COA, and the conclusions and recommendations for each COA. Staff estimates are normally text documents, but may be formatted as maps, graphics, or charts. The estimates are as comprehensive as possible, yet not overly time-consuming to develop. They are developed as part of the planning process, and updated as the operation progresses.

A-50. The staff estimate for IO is an estimate tailored to the specific needs of the IO staff. It assesses the situation in the information environment and analyzes the best way to achieve information superiority. Leaders focus on the information environment and the use of information by enemy and friendly forces. When possible, graphics are added to illustrate the less-tangible aspects of IO.

A-51. The written estimate is a six-paragraph document. The first two paragraphs are necessary for all plans. The other paragraphs can be truncated when time is short. Figure A-28, page A-23, depicts a format for a written IO estimate.

1. **Mission.** Define information superiority for the mission (Step 1).
2. **Situation and considerations.**
   a. Characteristics of the information environment (Step 2).
   b. Enemy forces (Step 3).
   c. Friendly forces (Step 4).
   d. Assumptions (Step 5).
3. **COAs.** List options for achieving information superiority.
4. **Analysis.** Estimate likelihood of accomplishing IO objectives given available time and capabilities.
5. **Comparison.** Compare COAs using evaluation criteria.
6. **Recommendations and conclusions.**
7. **Recommended COA based on which is most supportable by IO.**

Figure A-28. Example of an information operations estimate format

MISSION

A-52. The IO mission describes the operational advantage that IO achieves in support to the unit's mission.

Characteristics of the Information Environment

A-53. The characteristics paragraph describes the significant characteristics of the information environment in terms of the physical, information, and cognitive dimensions. The following characteristics should be considered:

- Terrain.
- Civilian information infrastructure.
- Media.
- Civilian population.
- Third-party organizations.

A-54. The character of each subinformation environment in the AO is reviewed to determine whether it favors friendly or adversary forces. Leaders identify information nodes in each subinformation environment (that is, places, persons, or infrastructure that shape information content and flow by creating or transmitting information).

Enemy Forces

A-55. The enemy forces paragraph describes how, when, where, and why the enemy force operates in the information environment. It identifies enemy capabilities and vulnerabilities in the information environment in terms of information—collection, protection, projection.

Friendly Forces

A-56. The friendly forces paragraph describes friendly-force capabilities to operate in the information environment. It identifies friendly vulnerabilities to enemy and third-party actions in the information environment.

Assumptions

A-57. The assumptions paragraph lists the assumptions essential for planning, execution, and assessment of the information operation. It is organized by—

- Information environment (information content and flow).
- Adversary capabilities and vulnerabilities in the information environment.
- Friendly capabilities and vulnerabilities in the information environment.

GRAPHIC INFORMATION OPERATIONS ESTIMATE

A-58. A graphic IO estimate (Figure A-29) contains the same basic information as a written estimate. It includes—

- Information superiority for the mission.
- Characteristics of the information environment (subinformation environment nodes).
- Enemy vulnerabilities and capabilities in the information environment.
- Friendly-force capabilities and vulnerabilities in the information environment.

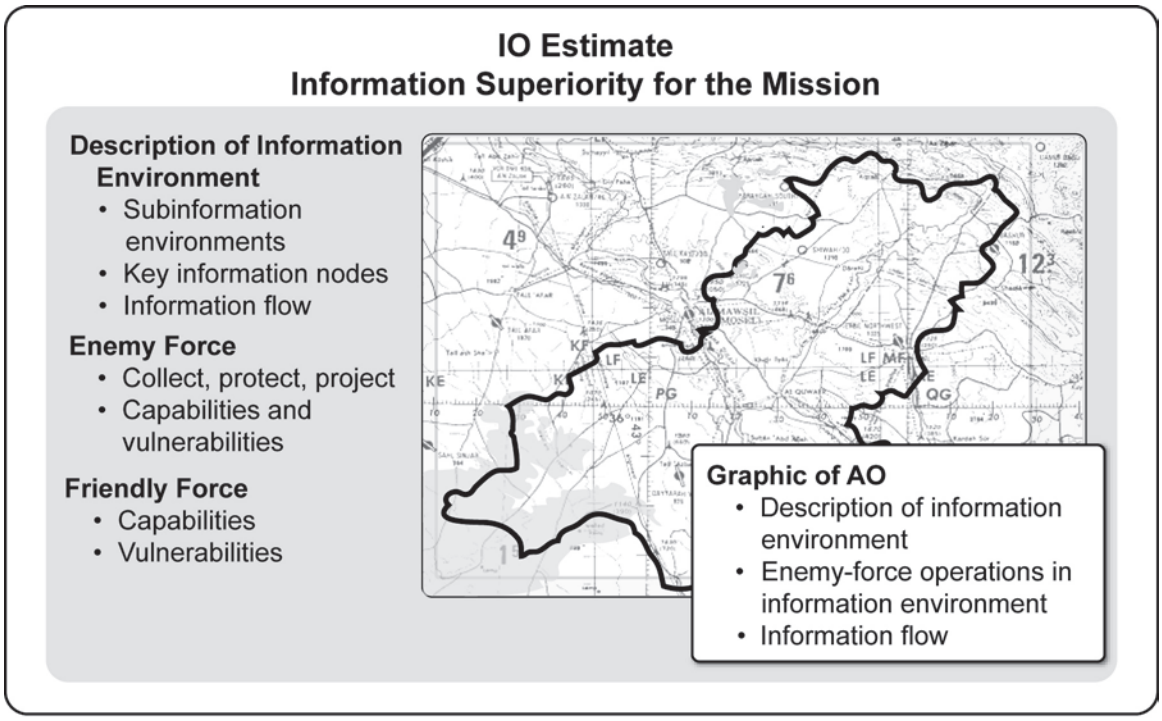

Figure A-29. Graphic information operations estimate

INFORMATION OPERATIONS ANNEX

A-59. Plans and orders are as detailed as time permits. Depending on the command and mission, these documents can be a series of overlays with written comments or they can be voluminous documents of hundreds of pages. Whatever the format, an order must be clear, concise, timely, and useful to the implementing commands and units. The IO annex describes the information operation as a whole and how IO forces will gain information superiority in support of the scheme of maneuver. This approach places less emphasis on individual IO assets and capabilities and more on the aggregate IO effects needed to achieve information superiority. The IO staff must be careful to not let the requirement to develop and explain the IO element contribution to the operation overwhelm the primary purposes of the IO annex, which are to—

- Provide operational details on the information operation.
- Focus element and unit tasks on achieving specific effects in the information environment.
- Provide the information needed to assess the information operation.

A-60. There are two basic formats for an annex:

- *Five-paragraph IO annex.* The five-paragraph annex (Figure 3-12, pages 3-16 and 3-17) is used when time is available and/or when directed by the G-3 or unit SOP.
- *Matrix IO annex.* The matrix annex (Figure 3-13, page 3-17) is used when time is available or when directed by the G-3 or unit SOP.

A-61. Figure A-30 provides an example of an execution matrix.

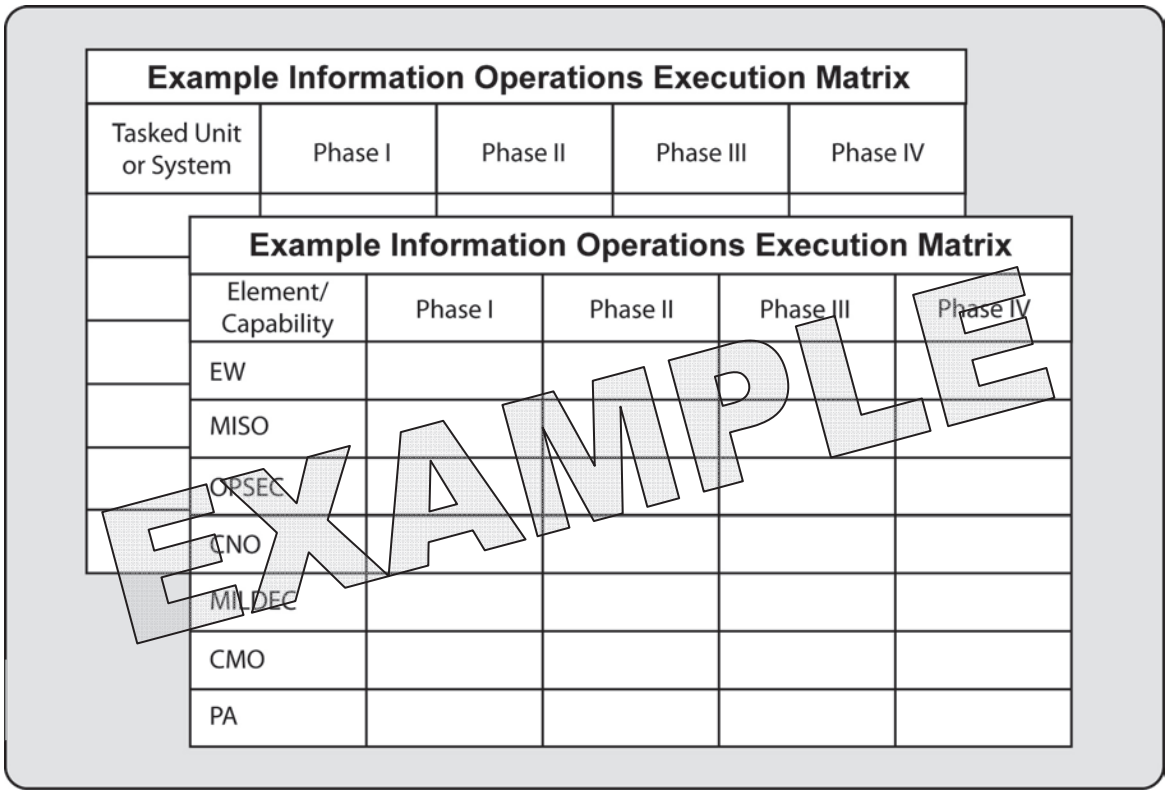

Figure A-30. Example of an execution matrix

INFORMATION OPERATIONS CONCEPT OF SUPPORT

A-62. The IO concept of support is a word picture that explains execution of the information operation from beginning to end and how the capabilities will be employed to gain information superiority. This requires defining information superiority for the operation. A well-written concept is concise and understandable. Although there is no doctrinally prescribed formula for an IO concept of support, planners should consider including the following:

- *Commander's intent for IO.* Explain what the commander wants IO to do to the enemy or the information environment.
- *Information superiority.* Explain specifically what information superiority is within the context of the operational situation and the mission. Include the specific time and location information superiority will be achieved.
- *General scheme for IO.* Use doctrinal concepts and terms to explain how the IO objectives will be achieved, who will perform IO (that is, the tasked units), and the sequencing of key tasks. Relate the key tasks to the achievement of information superiority.
- *Priority of support.* Designate which subordinate unit or element has the priority of IO assets and capabilities.
- *Restrictions on the employment of IO.* List prohibited and directed actions that affect the employment of IO.

This page intentionally left blank.

Appendix B

Tactical Deception Aid

Tactical MILDEC is deception planned and executed by and in support of tactical commanders to result in adversary actions that are favorable to the originator's objectives and operations. The purpose of tactical deception is to mislead or confuse the enemy decisionmaker by distorting, concealing, or falsifying indicators of friendly intentions, capabilities, or dispositions. Figure B-1 provides an overview of the deception planning process. Figure B-2, page B-2, provides a deception estimate format.

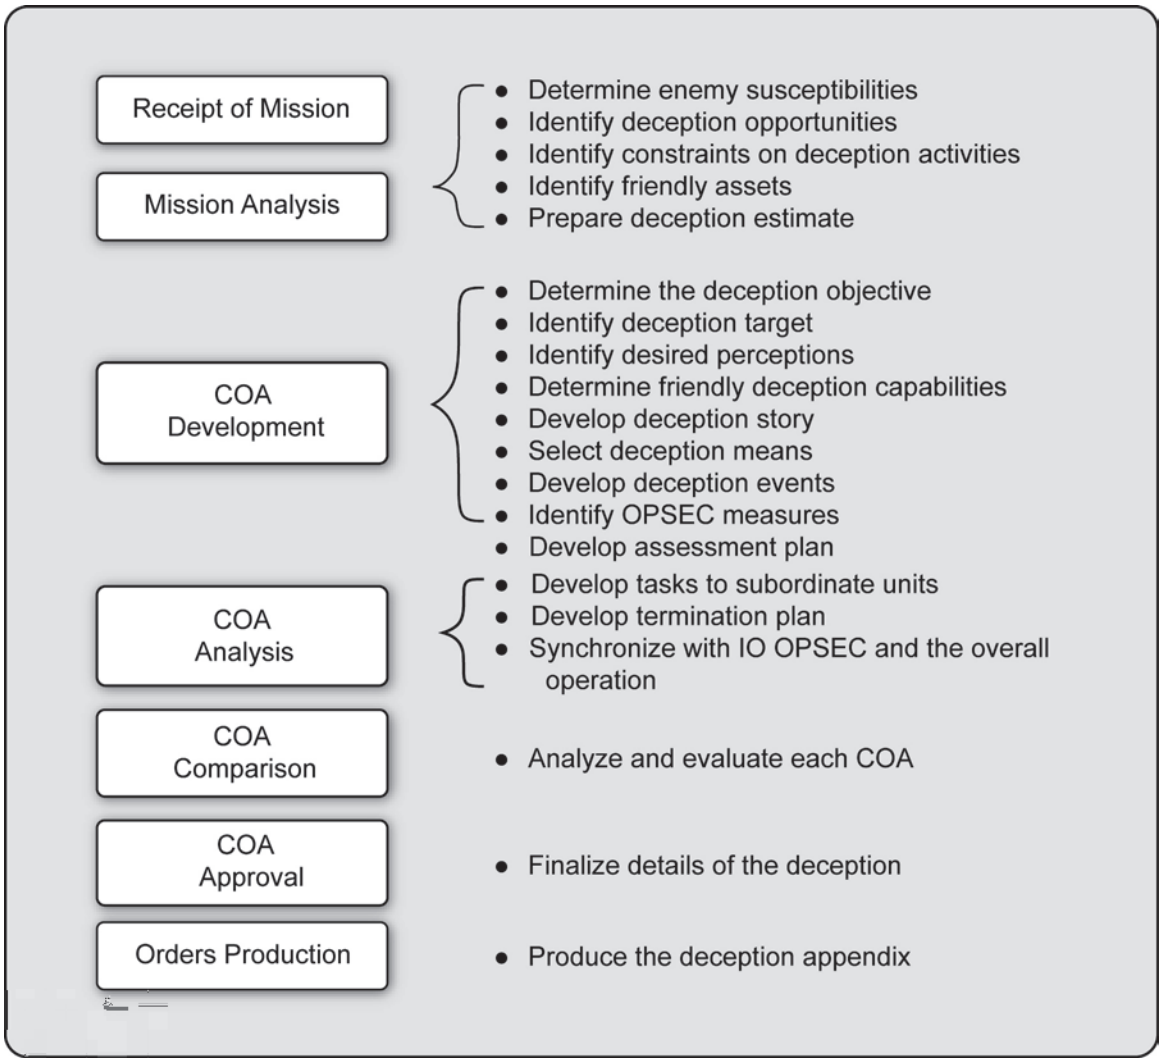

Figure B-1. Deception planning process overview

Page 3038 of 3957

Mission	• Restated mission of the command. • Deception objective. Identify the purpose of the deception.
Situation and COA	• Summarize the situation in terms of characteristics of the AO, enemy situation, friendly situation, assumptions. • Identify friendly deception COA.
Analysis of Deception COAs	• For each deception COA, list the target-vulnerability analysis, desired perceptions, deception story, means, events, risk analysis, and probability-of-success assessment.
Comparison of Deception COAs	• Compare each deception COA in terms of costs and benefits, operational risks, comparative strengths, weaknesses, and probabilities of success.
Recommendation	• Recommend a deception COA.

Figure B-2. Deception estimate format

DESIRED PERCEPTIONS

B-1. Desired perceptions are those thoughts the target audience must process to believe the planned deception story. The formation of the target audience's perceptions is largely based on the means and events used to portray the deception story.

MEANS

B-2. Considerations for selecting deception means include the following:

- What collection systems or mechanisms does the target audience use?
- How much credibility does the target audience place on information from each conduit?
- What kind of information can be conveyed through each of the means?
- When is each means available to transmit information?
- What filters affect information as it moves through the means?
- How long will it take the information to reach the target audience?

EVENTS

B-3. The deception story is portrayed to the target audience through deception events conducted by friendly forces. These are pieces of a puzzle that the target audience assembles over time. The puzzle itself is the deception story, the pieces are the deceptive events seen by the target audience via the means. Events must be observed and accepted as reality by the target audience. The two types of deception events include—

- Those necessary for the formation of desired perceptions (required events).
- The supporting events that complement or reinforce the desired perceptions.

ASSESSMENT PLAN

B-4. The two primary forms of feedback in deception operations are—

- *Indicator feedback.* This feedback is information that indicates whether and how the deception story is reaching the deception target audience. This feedback is useful for the timing and sequencing of executions. (It answers the question: "Is the target audience receiving the deception story as planned?")
- *Perception feedback.* This feedback is information that shows whether the target audience is forming the desired perceptions and is acting (or is likely to act) in accordance with the deception objective. (It answers the question: "Is the target audience acting in accordance with the deception objective?")

B-5. At the tactical level, the pace of operations and limited number of collection assets may reduce the practicality and utility of feedback. For this reason, at the lowest levels of command, tactical deception operations must not depend on feedback for successful execution.

DECEPTION TECHNIQUES

B-6. Tactical deceptions often contain one or more of the following techniques:

- *Feint.* A feint is a limited operation to deceive the enemy of the location or time of the decisive operation. Forces seek direct fire contact with the enemy but avoid decisive engagement. Feints usually occur before or during the main operation. Multiple feints may be needed to portray the deception story. The objective of a feint is to cause the enemy to misemploy forces.
- *Demonstration.* Demonstrations are shows of force to deceive the enemy as to the location or time of the decisive operation. They are similar to feints, except no contact is made with the enemy. The objective is to delude the enemy into an unfavorable COA. Demonstrations are useful when time and distance factors make the lack of contact realistic.
- *Ruse.* A ruse is a deliberate exposure of false information to enemy collection means.
- *Display.* A static display of an activity, force, or equipment is intended to deceive enemy observation. Displays project the appearance of objects that do not exist or appear to be something else. Observables include the use of heat, smoke, electronic emissions, false tracks, and fake command posts.

DECEPTION TACTICS

B-7. The two types of deception tactics are ambiguity-increasing deception and ambiguity-reducing deception. The following paragraphs discussed these tactics.

AMBIGUITY-INCREASING DECEPTION

B-8. Ambiguity-increasing deception increases decisionmaker uncertainty about key information needed to make decisions. It can be used to delay a specific decision or reduce the quality of a decision. Ambiguity-increasing deception—

- Presents conflicting elements of information.
- Overloads enemy intelligence-collection and analytical capabilities.
- Confuses enemy expectations about friendly-force size, activity, location, unit, time, equipment, intent, or mission.

AMBIGUITY-DECREASING DECEPTION

B-9. Ambiguity-decreasing deception provides the decisionmaker with the illusion of reduced uncertainty and risk. It can be used to elicit specific behavior that can be exploited by friendly forces and to provide cover for friendly actions. Ambiguity-decreasing deception—

- Reinforces the enemy's preconceived beliefs.
- Draws enemy attention from one set of activities to another.
- Creates the illusion of strength where weakness exists.
- Creates the illusion of weakness where strength exists.
- Accustoms the enemy to particular patterns of activity that are exploitable later.

MILITARY INFORMATION SUPPORT OPERATIONS IN SUPPORT OF DECEPTION OPERATIONS

B-10. At the tactical level, MISO are a primary deception capability. MIS units may conduct tactical deception by using sonic deception (that is, loudspeakers) for protection and in support of direct action missions. MIS forces may also develop, modify, and disseminate print and audiovisual products to support a deception operation.

DECEPTION IN SUPPORT OF COMBAT OPERATIONS

B-11. In support of combat operations, deception can preserve friendly forces and equipment from destruction, gain time, or minimize an enemy's advantage. A deception is most effective if the friendly force has more COAs available than the enemy has forces to cover in strength. The purpose of deception in combat operations is to create an operational advantage through surprise (that is, specific time, place, method, and scope of an attack). Possible objectives include the following:

- Delay or prevent the enemy's action or counteraction.
- Cause the enemy to misdirect assets.
- Cause the enemy to employ forces in ways that makes them vulnerable to the friendly COA.
- Cause the enemy to reveal strengths, dispositions, and intentions.
- Cause the enemy to waste combat power with inappropriate or delayed actions.

DECEPTION IN SUPPORT OF STABILITY OPERATIONS

B-12. Deception is appropriate during stability and support operations when transparency of operations is a likely requirement. Deception may serve to protect U.S. Soldiers, mask operational intentions, and deter adversary factions. The purpose of deception during such operations is to degrade adversary attempts to disrupt peace. Possible objectives include the following:

- Cause hostile forces to not attack friendly forces (protection).
- Deter factional violence.

B-13. Political objectives may override military considerations, to include the use of deception. Participation of multinational forces also may restrict the utility and use of deception.

DECEPTION IN SUPPORT OF OPERATIONS SECURITY

B-14. Deception in support of OPSEC increases the likely detection of indicators that the enemy can observe to derive an incorrect conclusion. OPSEC hides real indicators, whereas deception shows fake indicators. Observables are presented to distract enemy intelligence collection away from (or provide cover for) real friendly operations and activities.

DECEPTION IN SUPPORT OF COUNTERINSURGENCY

B-15. During counterinsurgency missions, in-depth human-factors analysis of deception target audiences may not be possible. In lieu of a human-factors analysis of the target audiences, planners can use profiles of cell leaders or security organizers. Counterdeception is important, as insurgent and guerrilla warfare theory emphasizes the use of deception to accomplish goals.

Appendix C

Tactical Operations Security Aid

OPSEC is a universal IO capability. It should be included in all plans, operations, and activities. The OPSEC process is a framework to systematically identify, analyze, and protect information. The goal of OPSEC, in conjunction with unit security programs, is to achieve essential secrecy. The OPSEC process should be integrated into the military decisionmaking process. It uses the steps indicated in Figure C-1, but does not have to follow them in a particular sequence.

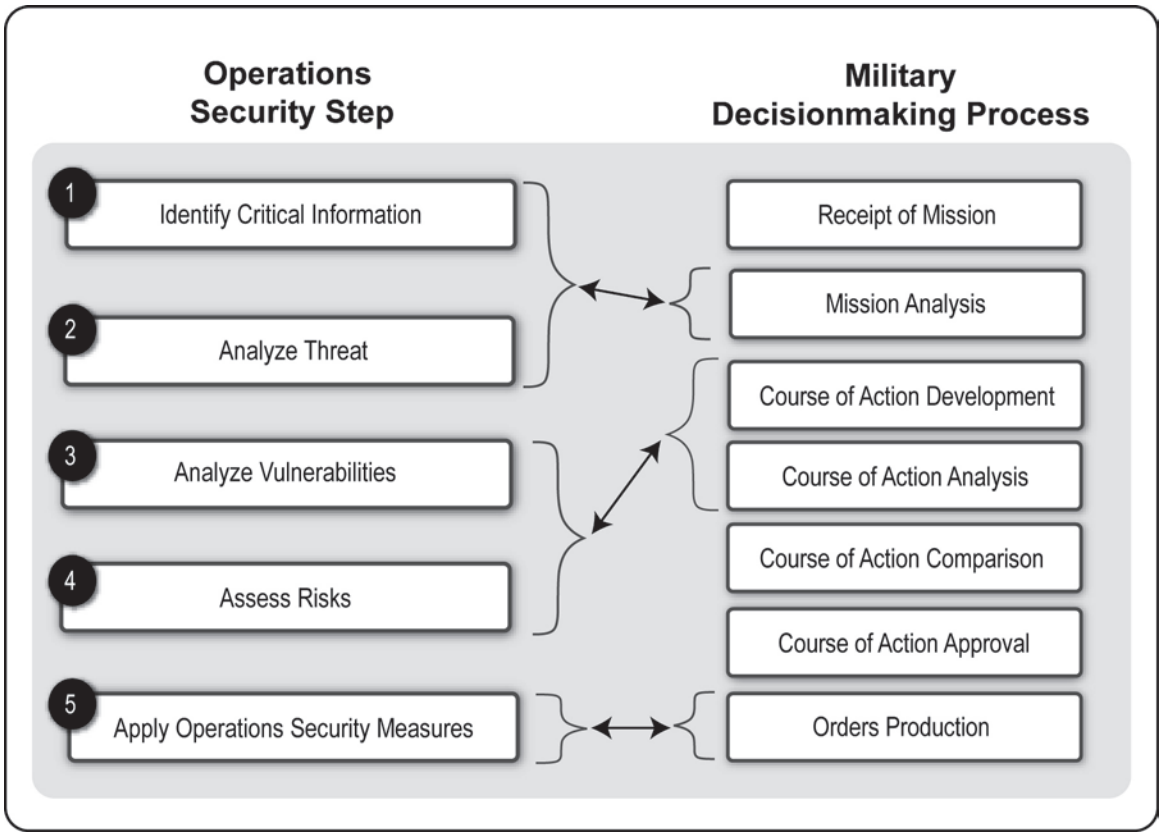

Figure C-1. Operations security and the planning process

IDENTIFY CRITICAL INFORMATION

C-1. Planners determine what information must be protected (that is, a list of EEFI). Sources of EEFI include the—

- Higher HQ plans and operation orders.
- Commander's guidance.
- Current unit EEFI.

Page 3042 of 3957

C-2. EEFI focus on friendly-force intentions (time and place of units and operations), capabilities, and vulnerabilities (strength, technologies, and tactics). EEFI are different for every operation. Leaders must avoid the "cookie-cutter" approach and should continually develop new EEFI or refine old EEFI. The OPSEC working group can be used to take advantage of subject-matter experts (for example, aviation and communications). Leaders identify the length of time each EEFI must be protected (not all information needs protection for the duration of the operation). EEFI are prioritized and kept to a manageable number (perhaps five).

ANALYZE THE THREAT

C-3. The threat to EEFI is the sum of enemy information needs and enemy collection capabilities. A CI template (Figure C-2) is a useful tool to depict enemy collection capabilities. It shows when and where the EEFI are vulnerable to enemy collection.

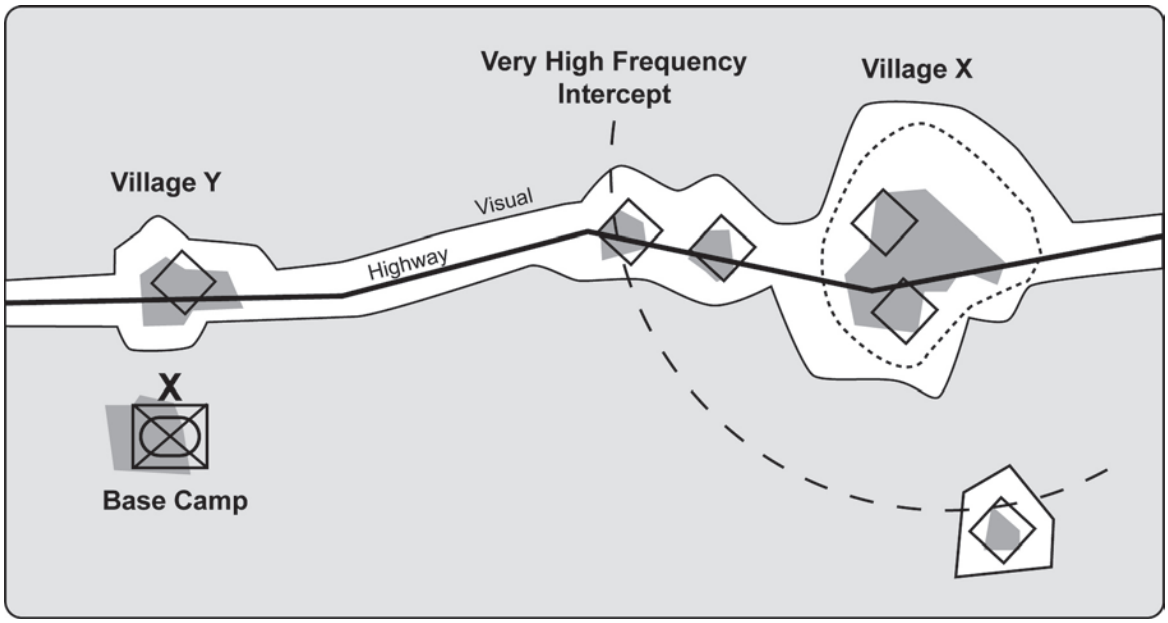

Figure C-2. Example of a counterintelligence template

ANALYZE VULNERABILITIES

C-4. Leaders identify each EEFI's vulnerability to enemy intelligence collection (that is, OPSEC vulnerability). The OPSEC vulnerability is a result of the OPSEC indicator and enemy collection capabilities. OPSEC vulnerabilities are detectable indicators of EEFI. OPSEC indicators become OPSEC vulnerabilities if they can be observed, analyzed, and acted upon by the enemy. To determine OPSEC vulnerabilities, leaders—

- *Identify OPSEC indicators.* Leaders determine what detectable actions and OSINT can be interpreted or pieced together by the enemy to derive EEFI.
- *Compare OPSEC indicators to enemy collection capabilities.* Leaders determine which indicators can be observed, analyzed, and acted upon by the enemy.

ASSESS RISK

C-5. Leaders develop measures to protect OPSEC vulnerabilities by conducting risk assessments for each vulnerability and then selecting one or more OPSEC measure for each vulnerability. There are three types of OPSEC measures:

- *Action controls.* The controls change unit procedures, activities, and actions (for example, randomized routine activities, avoiding repetitive TTP).

- *Countermeasures.* These measures disrupt enemy information-gathering and targeting (for example jamming [EW], physical attack, and camouflage and concealment).
- *Counteranalysis.* This action deceives the enemy by providing false indicators (for example, decoys and deception in support of OPSEC).

C-6. Once leaders decide which OPSEC measures to implement, they must check that OPSEC measures do not create new vulnerabilities. Leaders must balance OPSEC measures with operational effectiveness.

APPLY OPERATION SECURITY MEASURES

C-7. Leaders apply OPSEC tasks to units and staff as follows:

- Rewrite approved OPSEC measures as tasks.
- Assign responsibility and coordinate OPSEC tasks with units and staff.
- Coordinate OPSEC measures with MILDEC, PA, and COMCAM to prevent compromise of EEFI.
- Integrate OPSEC tasks with IO.
- Include OPSEC tasks in the operation order/operation plan.
- Adjust OPSEC measures based on adversary reaction to the implemented OPSEC measures.
- Monitor execution.
- Evaluate effectiveness.
- Adjust measures and tasks.
- Coordinate monitoring of OPSEC measures through the G-2 and CI.

This page intentionally left blank.

Appendix D

Media Assessment Aid

Media analysis is a quick and useful technique for evaluating the impact of media coverage on military operations.

IDENTIFY MEDIA SOURCES

D-1. Planners identify media outlets that are critical to mission accomplishment by analyzing the flow of media reporting in the AO and area of interest, selecting those media outlets that have local, regional, or international influence. Media outlets that are overtly biased toward the adversary should not be used. A good sampling of media outlets includes the following:

- *Local media in the AO.* These outlets influence local public opinion.
- *Regional media in countries adjacent to the AO.* These outlets can influence public and political opinion in the AO and area of interest. For example, in Afghanistan it is important to monitor the Pakistani press.
- *International media are the larger media outlets associated with countries outside the AO.* Typically these outlets impact U.S. domestic, coalition partner, and worldwide public and political opinion (for example, in Canada, the Canadian Broadcasting Corporation; in the United Kingdom, the British Broadcasting Corporation; in Germany, *Der Spiegel;* and in the United States, the Cable News Network, *The Washington Post*, *Los Angeles Times*, and *The New York Times*).

Note. Home (domestic) media is a primary consideration for the PA staff, but it is not a consideration for military IO.

D-2. The media analysis presented in this aid is a tool that staffs can use to understand and assess the impact of media reporting on friendly and enemy activities in the AO. This type of media analysis helps the staff—

- Maintain situational awareness on media reporting.
- Evaluate the impact of media reporting on the mission.
- Identify adversary information.
- Provide data for assessment.

D-3. Other staff elements may also conduct media analysis to support their functional area:

- The PAO conducts a media content analysis to assess news coverage.
- The intelligence staff may collect and analyze media reporting as part of OSINT.
- MIS forces prepare extensive media assessments and analyses of commercial and government media within their AO, as they seek to leverage more indigenous and credible local media outlets to use for dissemination.

D-4. The IO staff must be prepared to analyze the media, to monitor changes in the information environment, and to counter adversary misinformation and propaganda.

Page 3046 of 3957

DATA COLLECTION

D-5. Planners systematically monitor media coverage of the command, its mission, and the AO from the sources identified above. Useful sources of media reports and stories include the following:

- *PAO media operations center*. This center provides translations of foreign press coverage in addition to monitoring major English-language media outlets.
- *OSINT media-monitoring sources (contracted by the Department of Defense).*
- *United States Government open-source center.*
- *Internet.*

D-6. Data collection must be continuous and consistent—usually on a daily basis. Several factors can affect collection of data reports. Items that need to be considered include the following:

- English-language media sources are readily available and may skew the collection effort away from local media.
- Translation of local and regional media may cause a lag time of a day or more.
- A database should be created, populated, and maintained to establish a baseline upon which comparisons can be made (for example, media reporting for one month versus another month).

D-7. Other than the PAO's media content analysis, there is no established doctrinal method for analyzing the media. The media analysis process identified in Figure D-1 has been field-tested. It can be modified to fit command and staff needs.

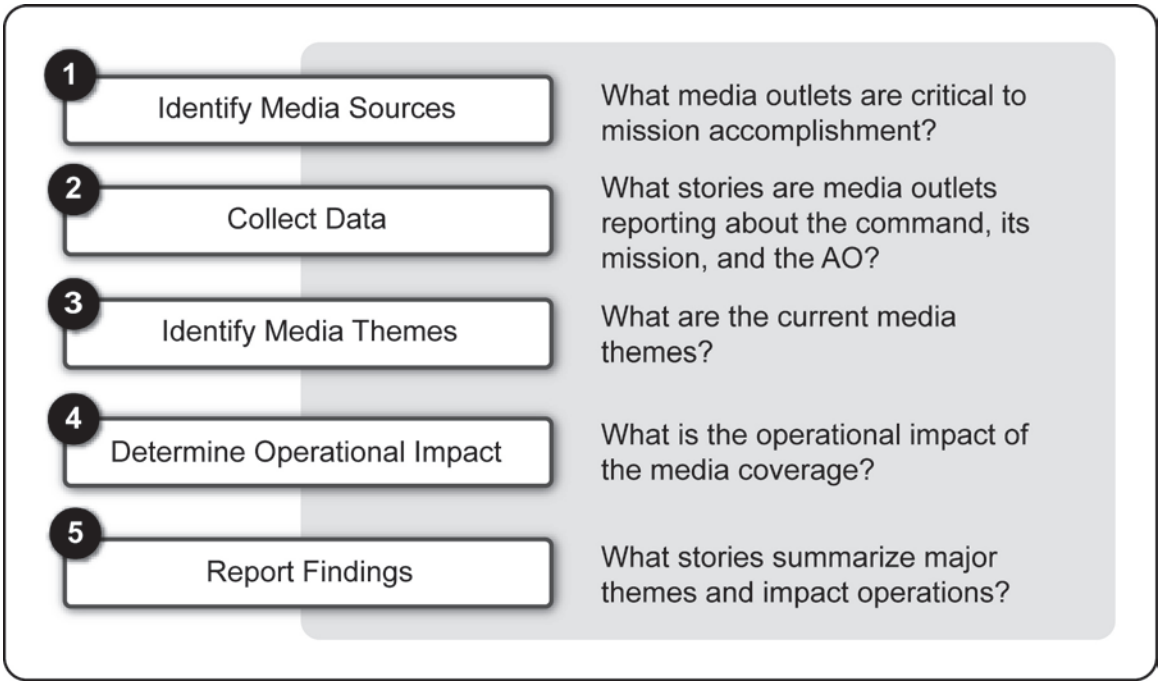

Figure D-1. Media analysis process

IDENTIFY MEDIA THEMES

D-8. Planners analyze and plot the media coverage collected above to identify current media themes (Figure D-2). Planners should do this by—

- Picking out primary themes in media reports and stories.
- Categorizing themes into groups that either support (positive), run counter to the command's objectives (negative), or are neutral to either enemy or friendly forces.
- Identifying ad hoc themes of interest to the command.
- Pairing media sources and themes to the command's objectives or lines of operation.

Objective	*Theme (+/–)*	*Source*
Maintain international support for mission	(+) United Kingdom supports troop expansion	British Broadcasting Corporation News and Cable News Network
	(–) U.S. missile strikes kill civilians	British Broadcasting Corporation News and Associated Press
Objective	*Theme (+/-)*	*Objective*
Reduce popular support for insurgents	(+) Tribal elders turn in Taliban to Afghan police	Local Armed Forces radio and TV
	(–) Taliban propaganda about U.S. missile strikes	*Dawn* (Pakistani newspaper)

Figure D-2. Media theme assessment diagram

DETERMINE OPERATIONAL IMPACT

D-9. Planners analyze the themes identified above to determine the impact on friendly and enemy operations. Media sources and themes are categorized by echelon (that is, local, regional, and international). For each theme, planners answer the following questions:

- Who is the originating source of the theme:
  - Enemy or hostile forces?
  - Friendly forces?
  - Third-party organization?
  - Embedded media?
- Who is the target audience?
- What is the circulation of theme (most critical for local media)?
- What are the second- and third-order effects?
- Is the event affected by extended media coverage?

D-10. Themes are prioritized within each category based on degree of impact. Planners determine which negative themes pose potential problems for ongoing and future operations and determine which positive themes provide an opportunity for exploitation.

REPORT FINDINGS

D-11. There is no standard method on how to report media findings. The key is to portray media coverage in an easily understood format that can be quickly scanned to see what themes are important. Planners should use color coding to clearly display the impact of each theme: green is positive, red is negative, and blue is neutral. Symbols (for example, +/–, letters, or numbers) should be added so the analysis can be understood if printed in black and white. Planners must resist the temptation to fill the

boxes with headlines rather than themes. Media themes that reflect enemy propaganda should be added, along with an assessment of operational impacts. Planners display a trend analysis to put the current media reporting into a broader context. Figure D-3 provides one technique of reporting findings.

CONSEQUENCE MANAGEMENT

D-12. Military operations can trigger either positive or negative coverage by the media. This coverage may be a situation that must be mitigated to prevent or reduce the impact on the unit mission, or exploited as an opportunity to further the command's objectives. Such a situation is called “media bounce.”

D-13. Media bounce refers to the staying power of a story over time. The bounce is usually short, particularly if another newsworthy event occurs. Monitoring media bounce avoids reacting to an event that loses media’s attention and may renew negative reporting, thereby aggravating the situation. A consequence-management tracker (Figures D-4 and D-5, page D-5) is a simple decisionmaking aid that tracks subsequent media reporting of an event (bounce) to determine whether subsequent command action is required.

Appendix E

Conducting Face-to-Face Meetings

This appendix provides a guide for tactical face-to-face engagements by troops at the detachment, company, battalion, and group level when meeting target audiences.

Leaders must always remember they are representing their unit, the command, and, for all intents and purposes, the United States and its allies. Regardless of rank or position, actions taken when in contact with the populace can shape the battlefield to defeat an enemy seeking local sanctuary to conduct attacks on the forces and allies of the United States.

PREPARING FOR A FACE-TO-FACE MEETING

E-1. Leaders can take a number of steps to prepare for face-to-face meetings. These steps include:

- *Research.* Leaders should learn everything they can about the target audience, to include proper name and title, approximate age, family members, ethnicity, language spoken, and the target-audience's relationship to other leaders, friendly forces, third-party organizations, and the adversary. Reliance on intelligence and MISO capabilities provides a strong foundation of information to leaders prior to a face-to-face meeting.
- *Check previous contacts.* Leaders should determine who has had contact with the target audience; when the meeting took place; what was discussed; what promises were made; whether the target audience was deemed truthful, manipulative, or trustworthy; and the groups or individuals to which the target audience is tied. With attached or assigned MIS forces managing the key-leader engagement program, this information should be catalogued and ready for access to guide future contacts.
- *Keep records.* Leaders should take notes during the conversation (either personally or via an aide) referring back to them at the end to capture the essence of the conversation. Notes should be shared with other interested persons, particularly MIS planners.
- *Coordinate.* Face-to-face meetings are coordinated to prevent other friendly forces from sending mixed messages to the target audience.
- *Set a time limit.* Leaders determine how long the meeting should be, staying as close to the timeline as possible while exploiting any available opportunities.
- *Consider perceptions.* Many factors affect target-audience perceptions (for example, uniforms, long versus short guns, large versus small convoys, aircraft in the area, type and size of escort, civilians present, and the number of people attending the meeting).
- *Plan for problems.* Leaders establish code words to maintain control of information flow and security. Typical situations where code words may be used include the desire to end the conversation, a noted potential for violence or increased threat, and other possible emergencies.
- *Rehearse.* Leaders practice the discussion with another person through the translator. Comments should be solicited from anyone having experience with the target audience.
- *Plan the rest of the operation.* Leaders should plan face-to-face meetings with the same intensity and focus as they would plan combat operations. Special items of note include—
  - Translator integration.
  - Movement (ingress and egress).
  - Security (both sides know of planned meetings, so units must anticipate compromise).
  - Contingency and emergency situations and covert danger signals.

Page 3052 of 3957

CONDUCTING A FACE-TO-FACE MEETING

E-2. When conducting face-to-face meetings, leaders should—

- *Bring past notes or previous reports for reference.* This demonstrates interest as well as directs the conversation into favorable areas.
- *Perform introductions.* Leaders introduce everyone in their party and record the names and positions of everyone outside their party who is attending. Collecting information is a key goal of each meeting.
- *Take photographs.* After asking (and receiving) permission, leaders should take photographs of the target audience.
- *Be sincere.* Leaders may wish to apologize in advance for any cultural mistakes made, reassuring the target audience that no offense is intended. Leaders may ask the target audience to point out errors as a learning tool. As the face-to-face meeting ends, the leader may wish to ask what cultural mistakes were made and thank the target audience for helping the leader to learn the local culture.
- *Avoid restricted topics.* Leaders should not discuss sensitive issues such as religion or other societal practices.
- *Compare notes.* Immediately after the meeting, the attendees should discuss what was observed to ensure an accurate understanding of what occurred.
- *Avoid false assumptions.* Leaders should never assume the target audience does not understand English.

CHANCE ENCOUNTERS AND CONTACTS

E-3. A chance encounter or contact with the target audience occurs most often during patrols at the squad, platoon, and company levels. The leader of the unit should conduct the face-to-face meeting based upon a preplanned battle drill. Items to consider during chance encounters include the following:

- *Maintain security.* The leader of the patrol should preserve security of the communicator and the target audience.
- *Maintain schedule.* The leader of the patrol should limit the length of the face-to-face meeting by establishing a code word for when it is time to end the meeting.
- *Identify the local leader.* The leader of the patrol should ask who is in charge and talk to him only. The patrol should not distribute anything to the populace without the local leader's permission.
- *Be fair and firm.* The leader of the patrol should stay in charge and be respectful, not rude.
- *Be selective.* The leader of the patrol should select a maximum of one or two people to talk with.
- *Take notes.* The patrol should get names of all people contacted, approximate ages, hometown, business or activity, subjects covered, demeanor towards friendly forces, and any particular concerns of the target audience. This information should be shared with the intelligence and MISO capabilities at the first opportunity after the contact.
- *Be prudent.* The patrol should not make promises that cannot be kept.
- *Establish rapport.* The leader of the patrol should offer the target audience refreshments (such as a bottle of water) and move to a comfortable location. Sit, if possible.
- *Focus.* The patrol should stay on message by knowing what messages the command is focusing on in specific AOs and during specific time periods.
- *Reinforce the message.* The patrol should use any applicable/available printed products (handbills, pamphlets, or posters) to reinforce the verbal message and request a formal follow-up engagement, if deemed necessary, based on the issues discussed.
- *Report.* The patrol should report all contacts with local leaders up the chain of command to ensure that an accurate picture of the situation is developed.

Page 3053 of 3957

Appendix F

How to Use Translators

The following information is specifically applicable to category I (local hire, uncleared) translators. However, some aspects of the information are applicable to category II (cleared for SECRET) and category III (cleared for TOP SECRET) translators.

Leaders must remember that the translator is their voice and their representative to the community. The translator will be seen as a representative of the command, of the Army, and of the United States. As such, leaders must monitor and keep all aspects of their behavior professional and ethical regardless of their nationality or ethnicity.

GENERAL GUIDELINES

F-1. Leaders should insist translators—

- Speak in first person.
- Remain nearby when the leader is speaking.
- Carry a notepad and take notes, as needed.
- Project clearly and mirror the vocal stress and overall tone of the leader.

F-2. Good leaders know their translators. The lives of Soldiers may be in the translator's hands, so it is critical to know the translator's strengths and weaknesses. Translators should be treated as part of the unit. The better the translator is integrated into the unit, the better the translator's performance.

F-3. Translators should be used for translation duties only. Using them for other activities may violate their contract. An example of misemployment is using a translator to run errands in town. However, sending the translator to town to coordinate a meeting for U.S. officials is allowed.

F-4. The translator is the leader's voice and, as such, may be subject to physical harm because of the messages delivered. Translators should be offered physical protection. If the translator is allowed to carry a weapon, the unit must ensure that he can handle it in a safe manner. Range familiarization/qualification (as well as knowledge of movement techniques and chemical, biological, radiological, and nuclear equipment) is highly recommended.

F-5. Translators should be allowed rest periods to collect their thoughts and catch their breath. Meal meetings are especially challenging for a translator. Leaders should ensure the translator is allowed to eat during or after the meeting.

F-6. Translators should be dressed like the troops they are supporting so they can be readily identified as a friendly in a combat situation to preclude fratricide. Uniform accessories (such as wet weather gear, body armor, and glint tape) that are common on Soldiers' uniforms should be made available to the translator.

REHEARSING WITH A TRANSLATOR

F-7. Leaders must check the translator to verify their abilities. To ensure accuracy and security, periodically record your translator, both with and without his knowledge, for quality checks by higher HQ. If operational details are briefed to the translator during the mission rehearsal, units may consider having the translator remain on the base camp until execution. Also ensure the translator does not have a cellular telephone or other communication device.

Page 3054 of 3957

F-8. Leaders must rehearse conversations, particularly when dealing with complex, new, or sensitive issues. A rehearsal will help define words the translator may not know and ensure the translator understands the overall message to be conveyed. Leaders provide feedback to the translator and make corrections as needed. Leaders must keep in mind that if the translator performs poorly, it affects the target audience's perception of the unit.

WORKING WITH A TRANSLATOR

F-9. Leaders must always maintain eye contact with the person they are speaking with and not the translator. The target audience should be observed for gestures, posture, and body language.

F-10. Leaders using translators should speak in short clips and not recite long paragraphs. The goal is to make the target audience feel like they are conversing and not being lectured. One to two sentences at a time is a good rule. Acronyms, slang, and idioms should be avoided.

F-11. For simple ideas or routine information, some leaders feel confident that the translator is capable of delivering the intended message. This technique works best if the leader introduces the topic and then expresses confidence in the translator's ability to speak on the leader's behalf. Conversations should be ended with closing comments and an opportunity for questions.

BATTLE DRILLS AND STANDING OPERATING PROCEDURES

F-12. There are some situations when a leader may want to establish battle drills or SOPs that address information the translator will convey to the local populace. Some possible situations and the type of information that the translators should be prepared to provide are—

- *Vehicle checkpoints.* Common concerns include questions about where the vehicle occupants are going or if they are armed, and instructions on where vehicle occupants should stand or what they should do during the search.
- *Cordon and search.* Common concerns include an explanation of what military forces are doing when they question residents about any weapons or suspicious activities.
- *Detention of a person.* Common concerns include an explanation telling why the person was detained, how the detention process works, how the detainee's family can reach the detainee, and how friendly forces humanely treat detainees.

SECTION II – TERMS

information environment

The aggregate of individuals, organizations, and systems that collect, process, disseminate, or act on information. (JP 1-02)

information operations

The integrated employment, during military operations, of information-related capabilities in concert with other lines of operation to influence, disrupt, corrupt, or usurp the decisionmaking of adversaries and potential adversaries while protecting our own. Also called **IO**. (JP 1-02)

information superiority

The operational advantage derived from the ability to collect, process, and disseminate an uninterrupted flow of information while exploiting or denying an adversary's ability to do the same. (JP 1-02)

13. ABSTRACT (maximum 200 words)

The United States and its allies have been subjected to clandestine interference campaigns led by the Russian government for nearly a century. The targets and mechanisms of subversive Kremlin influence have varied over the decades, but themes such as seeking to tamper with electoral processes have seen refinement and renewed vigor in the 21st century. From the inception of the Soviet Union to the era of Vladimir Putin, this thesis investigates the targets and mechanisms of subversive Russian influence—with particular focus on election meddling—to identify the greatest U.S. vulnerabilities to such interference campaigns. We determined that the Kremlin possesses a wide variety of well-honed tools such as disinformation, cyberattacks, and forgeries that allow it to apply stress to democratic systems and exploit rival nations' internal divisions, and that it has had success in deploying such tools in a number of Western democratic elections since 2014. We find that significant damage to the credibility of elections and the U.S. government is a viable vulnerability for Russian interference campaigns, and that mounting defensive measures against and mitigation thereof must be a top priority for U.S. national and homeland security entities.

EXECUTIVE SUMMARY

For roughly a century, the United States and its allies have endured coordinated efforts by the Soviet, and then Russian government to interfere in the West's domestic affairs. The frequency, intensity, tactics, and targets of these clandestine attacks have varied over the years, but the Kremlin's main goals of information manipulation, societal destabilization, reputational harm, and political influence have remained largely consistent. The efficacy of Russia's influence measures has also varied over the decades, but 21st-century advances in technology and decreased Western focus on Moscow as a major threat since the end of the Cold War have allowed these insidious tactics to proliferate in new and damaging ways. Left unchecked, Russian influence campaigns could cause severe harm to the integrity of future elections and the credibility of U.S. institutions.[1]

This thesis studies the history of Soviet and Russian meddling in the domestic affairs of the United States and its Western rivals to identify trends in their efforts and successes, and examines various recent interference campaigns as a means to understand the Kremlin's subversive attempts to influence foreign elections unduly. Studying the gradual buildup of capabilities beginning with the Soviet Union through Russian interference in the 2016 U.S. elections, commonalities and signals can be identified that highlight the greatest vulnerabilities faced by the United States and other Western democracies. Common themes this thesis identifies in both Soviet and modern Russian interference efforts include the use of media manipulation, proxy organizations, fabricated material, and instigation of specific, opposing groups to provoke division. Other recent Western elections and referenda allegedly affected by Russian influence, including France's presidential election the following year, further highlight Kremlin attack patterns. Commonalities found in this analysis include hack-and-leak incidents, plots involving election infrastructure, and attempts to manipulate voters through disinformation. What

emerges from this study is a clear signal that credibility of elections and legitimacy of government leaders and institutions are imperiled by Kremlin meddling, without a comprehensive or practical remedy.

Investigative findings by bodies including the bipartisan Senate Intelligence Committee demonstrate unequivocally that Russia's preferred influence operation outcomes in the 2016 U.S. presidential election came to pass, potentially along with "victories" in other elections.[2] With nearly a century of experience in covert influence techniques and plenty of practice trying to interfere in Western elections, Russia has many skills and tools, such as disinformation and cyberattacks with which to continue meddling in the democratic affairs of its rivals. The Kremlin has also clearly signaled an intention to continue stressing rival nations' democratic systems with a variety of techniques and targets, potentially including rumors of corruption and election fraud, exploitation, and exacerbation of domestic civil tensions, and even promotion of secession movements and rebellion loom as possible threats. Challenges to the legitimacy of some future elections are plausible, bolstered by a variety of well-honed Kremlin tradecraft, such as production or dissemination of genuine, doctored, or fabricated material designed to lend credence to allegations.

This thesis chronicles and draws connections between Soviet and modern Russian interference techniques to highlight the Kremlin's capacity and intention to inflict damage, such as election-related chaos and the ruination of the credibility of U.S. government institutions, leaders, and electoral systems. The examples and conclusions presented in this thesis seek to underscore the need for intelligence communities, investigative bodies, and other national and homeland security entities to prioritize efforts to identify, thwart, and deter Russian interference campaigns going forward, particularly with regard to the integrity of the electoral process.

ACKNOWLEDGMENTS

This thesis is dedicated to my late mother, whose constant encouragement and faith in me gave me the motivation to take on the challenge of applying for the Naval Postgraduate School/Center for Homeland Defense and Security (CHDS) program; to my late father, whose support helped me to persevere through obstacles and personal tragedy to make it through 18 months of coursework; to my sister, whose selfless and tireless service as my sounding board, proofreader, and shoulder to cry on as we coped was immense and invaluable; and to my wife and children, whose patience and inspiration as I struggled through this long thesis journey while grieving the loss of my parents will take a lifetime to repay. Mom, Dad, Melissa, Ira, Matviy, Anya—from the bottom of my heart, thank you! You were my motivation, and my rock.

Special thanks go out to all my CHDS professors, classmates, administrators, support personnel, editor Nancy Sharrock, and thesis advisors, Drs. Halladay and Tsypkin. All of them showed me kindness, patience, and encouragement when I needed it most; some, such as Dr. Bellavita, also provided carrots. Many thanks as well are in order to my colleagues and supervisors at the Transportation Security Administration, Federal Emergency Management Agency, and Cybersecurity and Infrastructure Security Agency who gave me the opportunity and support I needed to complete this project while dealing with profound losses, joyous family additions, stressful relocations, unprecedented disaster and pandemic response, and multiple career changes (especially Randy Cotten, who always encouraged me to apply for training but falsely claimed “I can’t help you get a master’s degree,” and Eric Rosner, who never let me forget that I had an extension deadline looming). Many times during the course of this academic journey, I feared I had taken on too much all at once, but friends, family, classmates, and faculty lifted me every step of the way to get me through it. I cannot possibly thank you all enough for your support and all I learned from you along the way. I will be forever grateful for the experience and opportunity, as well as your faith in me.

I. INTRODUCTION

For roughly a century, the United States and its allies have endured coordinated efforts by the Soviet, and then Russian government to interfere in the West's domestic affairs. The frequency, intensity, tactics, and targets of these clandestine attacks have varied over the years, but the Kremlin's main goals of information manipulation, societal destabilization, reputational harm, and political influence have remained largely consistent. The efficacy of Russia's influence measures has also varied over the decades, but 21st-century advances in technology and decreased Western focus on Moscow as a major threat since the end of the Cold War have allowed these insidious tactics to proliferate in new and damaging ways. Left unchecked, Russian influence campaigns could cause severe harm to the integrity of future elections and the credibility of U.S. institutions.[1]

Current Russian President Vladimir Putin is widely regarded as seeking to expand his nation's global influence and regional dominance, as well as to suppress any potential threat to his authoritarian grip on power in Russia.[2] While Putin may not share his Soviet predecessors' worries about imminent nuclear war with the United States, he does appear to retain their bitter mistrust and hostility toward the nation, which he accuses of fomenting and financing unrest within Russia along with revolutions in neighboring states.[3] Just as the Soviet leadership before him did, Putin appears to see weakening the U.S. government and its global influence as a key component of Russia's security and external power goals.

Page 3084 of 3957

As such, he employs the Kremlin's military and intelligence apparatus to do so.[4] Putin appears to believe that his foes engage in similar tactics, likely leading him to see Russia's influence campaigns as necessary, justified, and urgent. He has accused the U.S. government of fomenting revolutions in Eastern Europe to disrupt Russia's regional hegemony, aggressively expanding the North Atlantic Treaty Organization (NATO) to Russia's borders as a direct military provocation, and even attempting to remove him from power by leading a clandestine revolt.[5] Combined with his apparent fear that Western-style democracy could eventually lead to the end of his authoritarian reign, Putin has ample motivation to take steps to undermine and weaken the United States and its democratic allies. As such, the U.S. government must be aware of and on guard against all of Russia's destabilization efforts.

The November 2020 U.S. elections provide a case in point.[6] These elections took place in an environment in which the prospect of Russian interference was of grave concern to some voters and dismissed as a hoax by others, following years of reports and investigations about alleged Kremlin-backed election infrastructure tampering, dissemination of misinformation, and even attempts to incite violence.[7]

A. RESEARCH QUESTION

What are the greatest U.S. vulnerabilities to Kremlin interference campaigns, particularly with regard to elections?

B. LITERATURE REVIEW

This section focuses on Russia as a saboteur attacking the civil society of other nations from within through manipulation of such tools as cyber infrastructure and access to information. Because incidents, such as the 2016 U.S. presidential election interference, involve such relatively novel mechanisms as cybersecurity and the use of social media or alternative news sources, much of the available literature is very recently published.[8] A consensus apparently does not exist regarding which aspect or target of subversive Russian attacks is the most important or dangerous; as a result, the burgeoning array of recent sources lacks a cohesive narrative, theme, or focus.

1. Russia's Intent, Capability, and Mechanisms

An abundance of literature dutifully explains Vladimir Putin's belief that modern Russia deserves to be the center of the Slavic and Eurasian world and at least as strong a global power as the Soviet Union and Imperial Russia once were.[9] Many works credit Putin's adversarial attitude toward the West to a fear that expansion of the NATO military alliance is designed to weaken or threaten Russia's global prominence and its dominance of the Eastern European and Central Asian regions.[10] Among these writers, prominent Russian dissident Garry Kasparov and U.S. historian Walter Laqueur argue that the Russian president views his nation's success and security as a zero-sum game requiring the weakening of the United States and its allies, as well as a global acknowledgement that many states from the former Soviet territories must remain irrevocably within Russia's

orbit.[11] According to Laqueur, "Russian government strategy is dominated by the American shadow and the conviction that what helps the United States must be bad for Russia."[12] By extension, the Kremlin strategy also presupposes that what hurts the United States is quite likely beneficial for Russia.

Many sources emphasize that Putin's prior career as a foreign counterintelligence operative with the KGB[13] guides his alleged heavy use of clandestine or obfuscated tactics of subversion.[14] For example, Malcolm Nance warns, "For [Putin] to succeed at the mission of damaging the United States, he will use all tools of the Russian statecraft such as forging alliances, but also blackmail, propaganda, and cyberwarfare."[15] Regrettably, Nance's books and a number of other publications on the subject veer out of objective analysis and into sharply partisan political rhetoric. For example, Nance indulges his apparent distaste for Donald Trump with colorful descriptions, such as "Worse than his mouth was his fingers when connected to Twitter. In 140 characters he managed to derail his candidacy with insulting, racy, or inappropriate comments," potentially alienating some readers and blurring his analysis with his editorializing.[16] With years-long federal investigations into whether Russian interference helped Trump defeat Hillary Clinton in a polarizing 2016 election (and outsized national media coverage thereof), an influx of partisan, biased, and emotion-infused works on the topic is not particularly surprising, but must be taken with a grain of salt. Without much difficulty, recent mainstream newspaper articles and mass market books arguing for and against many Russia-based allegations can easily be found. To separate signal from noise and preserve accuracy, this thesis relies on scholarly, peer-reviewed sources where available. Study of partisan, biased, and speculative works is

nevertheless insightful, as the existence of multiple popular public works espousing exaggerated dangers, misguided fears, or foolhardy dismissal of legitimate risks could work to Russia's advantage as it seeks to undermine, conceal, and obfuscate. One example is a nakedly partisan 2018 work entitled *Russia Hoax* penned by a longtime Fox News anchor, which devotes an entire chapter to downplaying or refuting risks and legal questions regarding a controversial meeting between Trump campaign representatives and Russian representatives offering "dirt" on Clinton.[17]

A study by Kevin McCauley shows how Soviet manipulation techniques have evolved into the current threat posed by Putin's Kremlin.[18] This work alleges that in addition to launching conspiracy theory-peddling media disinformation campaigns and employing online "troll armies" to disparage unfavorable information sources, Russia employs targeted destabilization campaigns in a number of NATO and European Union (EU) countries in a further effort to weaken or dismantle the alliances.[19] Citing reports from NATO and the governments of Estonia, Moldova, and the United States, McCauley asserts, "The Russian Federation is conducting sophisticated and large-scale disinformation campaigns to destabilize U.S. allies and interests" and explains, "Russia continues to employ influence methods formulated under the Soviets, as well as integrating new information age methods."[20] His conclusions support others warning that Russia uses "troll armies" and such other cyber tactics as social media.

In pursuit of destabilization, Russia has been accused of interfering with elections of friend and foe alike, including Ukraine, Moldova, Georgia, the United States, Great

[19] "Russian troll armies" is a term used to describe networks of internet commentators, allegedly paid by the Kremlin and often posing as Westerners, who systematically post propagandistic comments on Western news articles and social media in support of Russia or against its foes.

[20] McCauley, *Russian Influence Campaigns*, loc. 8541–8697.

Britain (particularly regarding Brexit), and France.[21] Mikhail Myagkov, Peter Ordeshook, and Dimitry Shakin provide "evidence and eyewitness accounts that even Russian spin doctors and those who committed fraud cannot dispute" of fraudulent machinations employed to ensure favorable results in both Russian and Ukrainian elections within the 21st century.[22] The same author team reached similar conclusions through a separate analysis of the 2004 Orange Revolution in Kyiv.[23] Ominously, both the 2009 *Forensics of Election Fraud* and the 2008 *Election Fraud: Detecting and Deterring Electoral Manipulation* also devote pages to the study of the U.S. vulnerability to election fraud, with the latter detailing several mechanisms by which Americans' confidence in the legitimacy of the vote could be shaken. One warning stands out sharply, namely that "in the United States since the 2000 election there have been concerns raised regarding electoral irregularities—either intentional election fraud or unintentional problems in the election that result in an inaccurate (and thus sometimes in the eyes of the losing side, fraudulent) outcome."[24] In more detail, the authors assert:

> The ongoing debate about the security of electronic voting technologies reflects one aspect of this debate. Concerns have also been raised about fraud in absentee voting, early voting, precinct voting, and voting by military personnel and overseas civilians… that are all unrelated to the type of voting technologies used. Moreover, in the 2002 gubernatorial election

Page 3089 of 3957

> in New Hampshire, there were convictions related to jamming political party 'get-out-the-vote' telephone banks.[25]

Such factors point to a potentially serious security risk. Between Russia's experience, history, and motivation regarding election infrastructure tampering in foreign states, and existing latent susceptibility to shaken confidence in U.S. elections, the Kremlin has a sizable opening to exploit in its destabilization efforts, and may already be attempting to make use of it.

2. 21st Century Vulnerabilities

Covert interference can take many different forms, and democratic elections can be subverted in a variety of ways from voter suppression and election infrastructure tampering to subversive attempts to influence potential voters. Works related to Russian attacks and emerging vulnerabilities regarding elections have proliferated in recent years, though some topics have garnered considerably more attention than others have. Methods of interference Russia has been accused of using to disrupt Western states' electoral processes successfully include the following:

- hacking as a form of espionage or sabotage
- the leaking of stolen information
- propagating false news and propaganda distribution and promotion
- deployment of online troll armies
- the financing of fringe candidates
- release of *kompromat* (compromising material) to damage a government leader or political candidate
- provocation and support of secession-minded dissidents

[25] Alvarez, Hall, and Hyde, 71.

Page 3090 of 3957

Of these tools, one with an abundance of recently produced literature is the topic of hacking. Cybersecurity sources from 2014 and earlier seem to focus on the threat to infrastructure, military, and intelligence rather than the use of stolen information to tip the balance in elections and undermine a particular candidate, party, or entity, but even on this topic, a consensus is also lacking. Marc Goodman presents dire warnings of drone and pacemaker hacking, as well as a large-scale power grid shutdown, in *Future Crimes*; likewise, Ted Koppel's *Lights Out* points out that Russia has already penetrated the United States' power grid network.[26] Both of these volumes argue that the U.S. government is not adequately equipped to deal with the large-scale disaster that a sustained cyberattack on the grid could cause, whether due to legislative inaction or practical limitations. Koppel's caution is particularly dire. He warns:

> The American public are not the only ones unwilling to contemplate, much less cope with, the eventuality of a debilitating cyberattack against our power grid. The government agencies and civic organizations charged with enabling the nation to recover from catastrophe are also woefully unprepared.[27]

Such lack of readiness could be due to any or all of the same failures (imagination, policy, capabilities, and management) identified in the 9/11 Commission Report regarding the federal government's inability to stop the novel terrorist attacks of September 11, 2001; indeed, each of these are alleged to some degree in Goodman and Koppel's works.[28] Though books, reports, and studies critical of U.S. government inaction and lack of preparedness against state-sponsored hacking threats are increasingly prevalent, works analyzing existing shortfalls and capabilities are less abundant but beginning to emerge. In March 2020, a congressionally sponsored group called the U.S. Cyberspace Solarium

[28] Thomas H. Kean and Lee Hamilton and U.S. National Commission on Terrorist Attacks upon the United States, *9/11 Commission Report: The Official Report of the 9/11 Commission and Related Publications* (Washington, DC: Government Printing Office, 2004), http://www.gpoaccess.gov/911/index.html.

Commission released a report detailing risks, outlining challenges, and recommending a strategy of "layered cyber deterrence" U.S. government agencies could adopt to mitigate its cyber-based vulnerabilities.[29] The report contained more than 80 recommendations for U.S. government entities on the topics of structural reform, cultivation of enforcement tools, and promotion of resilience and collaboration with the private sector, though it remains unclear how many will be adopted. A consortium of U.S. government agencies attempted to conduct a 2020 exercise of a large-scale state-sponsored cyberattack with kinetic effects and produce an interagency after-action report, but the COVID-19 pandemic scuttled these plans.[30]

Works covering the spread of false information—"fake news"—have become abundant since the 2016 U.S. presidential election, to include information deliberately spread by suspected Russian actors. A 2017 paper from Stanford University states:

> Recent evidence shows that: 1) 62 percent of U.S. adults get news on social media; 2) the most popular fake news stories were more widely shared on Facebook than the most popular mainstream news stories; 3) many people who see fake news stories report that they believe them; and 4) the most discussed fake news stories tended to favor Donald Trump over Hillary Clinton.[31]

A key challenge to such recent studies is the fact that the fake-news environment continually changes in the era of social media; as awareness of fake-news campaigns and the associated risks grow, governments and media entities adapt to contain them, while purveyors rapidly adapt to the restrictions and entrepreneurs capitalize on dissent. For example, social media platforms Facebook, Twitter, Reddit and YouTube each took a number of escalating measures between 2017 and 2020 in reaction to novel fake-news tactics, but still drew criticism in the process and sometimes had to roll back certain actions

in response to the backlash.[32] At the same time, such rival platforms as Gab and Parler have emerged specifically as an alternative for social media users frustrated by the restrictions of the industry's titans.[33] As a result, many recent works studying the environment of fake news and social media have become quickly outdated, and exist mainly as an incomplete snapshot in time inside a rapidly changing ecosystem. As a case in point, two 2020 studies on Facebook's internal efforts to combat fake news, while insightful and not without merit, each focused on measures the company modified, improved, or replaced just months later in response to newer threat information and public feedback regarding its policies.[34]

Books, think-tank reports, and a number of government hearings and reports highlight Russia's role in disinformation campaigns, including fake news and

[32] An example of measures rolled back due to criticism include Twitter's October 2020 decision to rescind its ban on the sharing of a controversial article about U.S. presidential candidate Joe Biden and his son. The veracity of the article's assertions had been heavily questioned and some U.S. lawmakers had warned of a high probability that its genesis had been a Russian disinformation campaign, though the official reason for Twitter's ban (and the blocking of Trump administration and congressional accounts that attempted to share it) was that the article contained private personal information and material allegedly gleaned from a hack. The reversal came after withering criticism and accusations of politically motivated censorship from President Trump and lawmakers from his party. The official reason given by Twitter was that the article had received so much attention that the information therein was no longer technically "private," and it did not publicly explain whether its stance on the allegations that it came from hacked material had changed. propaganda.[35] The House of Representatives Committee on Armed Services 2015 hearing *Countering Adversarial Propaganda* and the Committee on Foreign Affairs' hearing *Confronting Russia's Weaponization of Information* from later that year provide a glimpse into the U.S. acknowledgement of Russia's campaign to harm the West through targeted information.[36] In the former, a member of the U.S. government's Broadcasting Board of Governors testified:

> With Russia, much of the propaganda that surfaces is aimed at destabilizing the West, undermining the trust and credibility of journalism, of government, of NATO, of EU, and all those things…the Russian propaganda aimed at the non-Russian audiences aimed at undermining NATO, EU, government, media…is a very scary destabilizing influence if it is actually having the impact—and it is a seeping impact—onto the audience.[37]

The latter went much further, beginning with a stark warning from Russian propaganda expert Peter Pomeranstev, who explained that while Russia knew it was no match for NATO in physical combat:

> what if the Kremlin could bypass NATO militarily, make war without ever, officially at least, firing a shot? What if it could use the very openness of democracy's open markets, open culture and, very importantly, open information against us? So over the 21st century, Russian military theorists developed a theory of what they called information psychological or hybrid war—a mix of media, economic and cultural warfare with a dab of covert military action.[38]

Witnesses at the hearing also explained how such a strategy was enacted through a wide array of tools to include what Pomerantsev described as "bankrolling and lending political support to both far right and far left parties" to create instability in Western nations,

weakening U.S. influence and NATO power, and working to "sow divisions, demoralize and disorganize—to weaponize information." Such reports illustrate that while the U.S. government may not have had remedies for Russian destabilization efforts in the mid-2010s, it was not necessarily unaware of the threat thereof.

C. RESEARCH DESIGN

This thesis studies the history of Soviet and Russian meddling in the domestic affairs of the United States and its Western rivals to identify trends in their efforts and successes. My analysis requires a study of the known threats, adversarial tactics, and vulnerabilities and the Kremlin's apparent goals, to identify possible unmet needs for U.S. security and intelligence entities to use in countering Russian interference.

This thesis studies various recent interference campaigns as a means to understand the Kremlin's subversive attempts to influence foreign elections unduly. After studying the gradual buildup of capabilities beginning with Soviet Union, I explore the case of established Russian interference in the 2016 U.S. elections and trace Russia's actions to identify commonalities or signals to ascertain better the greatest vulnerabilities Russia has an opportunity to exploit. Common themes I identified in both Soviet and modern Russian interference efforts include the use of media manipulation, proxy organizations, fabricated material, and instigation of specific, opposing groups to provoke division. I also compare the 2016 U.S. election case to other recent Western elections and referenda allegedly affected by Russian influence, including France's presidential election the following year. Commonalities found in this analysis include hack-and-leak incidents, plots involving election infrastructure, and attempts to manipulate voters through disinformation. What emerges from this study is a clear signal that the credibility of elections and legitimacy of government leaders and institutions are imperiled by Kremlin meddling, without a comprehensive or practical remedy.

D. OVERVIEW OF CHAPTERS

In Chapter II, I outline the evolution and refinement of Russian interference campaigns from their genesis in the early days of the Soviet Union through to the era of Putin's second decade in power to highlight the scope and seriousness of the threat faced

by the United States and its Western allies. Chapter III is an in-depth look at how the Kremlin's refined disinformation system was deployed within the U.S. 2016 presidential election campaign, along with similar actions in EU member states' elections. In Chapter IV, I examine the fallout from Russia's meddling in the 2016 U.S. presidential campaign to determine plausible damage scenarios the United States may encounter if it fails to deter or mitigate against ongoing and future Russian disinformation efforts effectively.

THIS PAGE INTENTIONALLY LEFT BLANK

II. A CENTURY OF KREMLIN INTERFERENCE: DIRTY TRICKS PAST AND PRESENT

Russia's present capabilities and strategies to destabilize rival governments are the product of a long history of refinement. This chapter chronicles three elements of Soviet influence campaigns: media manipulation, secret proxy organizations, forgeries and rumors, and manipulating and instigating multiple groups to distrust and attack each other. The present analysis then shows how such methods have evolved into the contemporary threat toolbox, which still features media manipulation and proxy organizations while adding novel cyberattacks as a force multiplier.

A. THE ORIGINAL THREAT

From its inception in the 1920s, the Soviet Union developed and refined a sophisticated series of subversive actions and manipulation techniques to employ against the United States and its allies. The Kremlin's main security agencies (in various incarnations including Cheka, NKVD, KGB, GRU, and FSB) have dedicated official departments to carrying out these attacks, known primarily as "active measures," for example, "dezinformatsiya"—disinformation.[39]

In a Cold War-era study of the long history of Soviet disinformation campaigns, Roy Godson and Richard Shultz defined "active measures" as:

> influencing the policies of another government, undermining confidence in its leaders and institutions, disrupting relations between other nations, and discrediting and weakening governmental and non-governmental opponents. This frequently involves attempts to deceive the target… and to distort the target's perceptions of reality.[40]

Page 3098 of 3957

"Dezinformatsiya" was one of the principal tools of a broader campaign to alter perceptions and attitudes in ways that benefited the Soviet Union, and proved to be one of its most insidious weapons. With the strategic use of this discipline, Moscow could cause covert damage in the West without drawing it into a potentially catastrophic armed conflict, and support behaviors and policy changes in rival states where threats and diplomatic entreaties could not succeed.

1. Media Manipulation

One of the earliest examples of calculated manipulation of Western audiences involved compromising a trusted source within a prominent American newspaper: *The New York Times*. In the 1930s, *Times* columnist Walter Duranty won a Pulitzer Prize for descriptions of Soviet dictator Joseph Stalin and conditions of life under his rule, but subsequent research reveals that his articles ranged from hagiographic to deeply disingenuous.[41] Duranty produced deliberately inaccurate dispatches from his post within the Soviet Union that aggressively contradicted reports of a brutal famine in the country's western regions (this mass starvation, known as *Holodomor*, is now widely believed to have been a purposefully created genocide conducted by Stalin against Ukrainian peasants).[42] Duranty not only presented a deceptively rosy picture of Ukrainian life in his articles during the time of mass famine, but also actively sought to discredit accurate Western reporting on it.[43] Most notably, he forcefully refuted the accurate press releases of Gareth Jones, a British reporter for prominent newspaper *The Times* whose subsequent murder was allegedly carried out by Soviet secret police ordered to put an end to his

[43] Conquest, 320.

negative reporting.[44] Duranty's attempts to destroy Jones's credibility hint that his Soviet benefactors had both the intent and the means to influence Western opinion both through false information and the suppression of factual information it found unpalatable.

By all appearances, Duranty's actions were not the work of an objective, honest journalist, working independently without bias or coercion. Duranty enjoyed a lavish lifestyle during his tenure as a journalist in Moscow, to include awards and praise bestowed on him by Joseph Stalin.[45] By all appearances, the Soviet government made concerted efforts to ensure that its relationship with Duranty was a positive one with "benefits" to both sides; in a country known for its iron grip on control of the domestic press, the fact that Stalin praised and likely courted a renowned Western reporter is a telling sign of the Kremlin's strategy of information manipulation abroad.

According to Robert Conquest, Duranty may have had other incentives to write articles in service of the Soviet Union beyond being seduced by the opportunity to boost his career with interviews and unrivaled access to Stalin; he was possibly being blackmailed as well.[46] In one of the earliest potential examples of Soviet manipulation of Western citizens through *kompromat*, it has been alleged that Stalin's secret police used knowledge of Duranty's opium abuse and participation in bisexual orgies to ensure that his journalistic missives were acceptable to, if not laudatory of, the Communist Party of the Soviet Union.[47]

According to Duranty biographer S. J. Taylor, Duranty's Soviet-friendly *New York Times* articles influenced President Franklin Delano Roosevelt's 1933 decision to grant

Page 3100 of 3957

diplomatic recognition of the Soviet Union.[48] Notably, Roosevelt's recognition of the Soviet Union was contingent on a guarantee from the Soviets that they would not interfere in domestic American affairs or disseminate propaganda within U.S. territory; the U.S. government already suspected such an agenda.[49] Declassified State Department documents show that diplomatic relations between the two nations soured within months of the recognition, as "evidence emerged that the Soviet Government had violated its pledge not to interfere in American domestic affairs" along with reports of state-sponsored killings known as "The Great Purge."[50]

Manipulation of the press to benefit the Soviet Union was a feature of *dezinformatsiya* in neutral states as well. A Central Intelligence Agency (CIA) report revealed that the Soviet Union managed to place more than 160,000 messages into India's ostensibly free press between the 1960s and 1980s by using several hundred bribed or compromised journalists across at least six English-language papers.[51] The smuggled notes of KGB dissident Vasili Mitrokhin later corroborated this report that indicated that no fewer than 10 Indian papers were under Kremlin control by 1973 and more than 5,500 KGB-tailored articles appeared in Indian papers in 1975 alone.[52] Along with allegedly outright coercing individual journalists to do their bidding, the Soviets also exercised other types of influence, both overt and clandestine, over foreign press to amplify their disinformation.[53] The CIA report describes two methods by which disinformation made its way into prestigious Indian papers that relied on credible sources. In one method, Soviet operatives debuted fraudulent articles in smaller and less-heralded publications—for

example, the communist press—and then encouraged journalists at English-language publications to pen their own articles using these planted articles as sources. In the other method, the Soviets placed their articles directly into Indian press and wire services whose managers they had bribed and then used these services' bylines to add cover and legitimacy.

Such operations undoubtedly served to influence domestic Indian public perceptions, yet they carried another key benefit with even greater value for the Kremlin. These tactics gave the Soviets the ability to publish rumors, insinuation, and disinformation under respected Indian newspaper mastheads and then cite them as "neutral" international sources in disinformation campaigns throughout the globe.[54] By cloaking their damaging rumors and disinformation in the credibility of neutral foreign press, the Soviets could appear to merely amplify objective information, and thus infect Western audiences that had long since learned not to trust any accusations originating directly from Moscow. In one notable instance, a 1968 hoax—alleging that the U.S. military had been spreading weaponized epidemics in Vietnam and Thailand—was introduced by the Mumbai-based *Free Press Journal* and amplified in a weekly publication called *Blitz*.[55] This fabrication—fake news before the age of fake news—was based on a forged U.S. Office of Naval Research letter produced by the KGB active measures division known as "Service A" and gained enough traction and credibility from its coverage in the Indian press to achieve republication in the London *Times*.[56] Popular acceptance of this slanderous fabrication fueled anti-U.S. military sentiment that may still linger to this day, as persistent rumors

about U.S. military use of biological weapons may well have roots in stories based on Soviet sources.[57]

As shown in the alleged coercion or bribery of Walter Duranty, a key component of Soviet disinformation efforts was the courting and financing of Western journalists to promote a Kremlin-approved counter-narrative. Allegations and proven cases of such attempts throughout the Cold War abound, with the case of French journalist Pierre-Charles Pathé standing out as one of the most high-profile instances.[58] French officials observed Pathé, regarded as an expert on Soviet affairs by prominent French media outlets, in 1978 conducting a clandestine meeting with a KGB agent, when he was given money and documents instructing him on points and themes he was expected to publish under his own name.[59] Upon his subsequent trial and conviction, it became known that he had spent 20 years in the service of the KGB disinformation campaign and published articles under pseudonyms as well as in his own name. His Soviet-financed publications included a journal called *Centre d'Information Scientifique, Economique et Politique* and a newsletter called *Synthesis,* described as highly influential to the French political elite.[60] An analysis of the majority of *Synthesis* editions by Godson and Shultz revealed, along with multiple articles attempting to pin the assassination of President John F. Kennedy on the Federal Bureau of Investigation (FBI), several key themes amplifying Soviet positions, including:

> fostering mistrust among the NATO allies and their friends, denigrating Western weaponry and defense policies, criticizing French policy vis-à-vis American and NATO political and defense arrangements, and expressing distrust of and censuring the United States.[61]

The Kremlin had evidently cultivated Pathé's reputation as an expert on Soviet affairs in part by feeding him information and funding, and in part, by exploiting his status as the son of a prominent French filmmaker.[62] Once his credibility and bona fides were thus established, the subsequent propaganda and false information published under his name carried an air of legitimacy in the Western world far greater than the Soviets were able to achieve through their dissemination of overt propaganda.

2. Secret Proxy Organizations

Another early method of interference in domestic American affairs was Soviet support for such foreign communist organizations as the Communist Party of the United States of America (CPUSA). As shown by its own records (retrieved from Russia by emissaries from the U.S. Library of Congress after the fall of the Soviet Union), the CPUSA worked with its Kremlin financiers to exploit disaffected or oppressed segments of the U.S. population as early as the 1920s.[63] Such targeting included farm workers hit hard by the Great Depression and Black citizens suffering under oppressive Jim Crow discrimination. These efforts netted such victories as the recruitment of popular African American actor, singer, and sportsman Paul Robeson to promote, amid much contemporary controversy, the Soviet cause as superior to the oppressive U.S. government.[64] In the CPUSA and other ostensibly domestic organizations, the Kremlin cultivated valuable covert means to recruit spies, allies, and unwitting assistants, and to manipulate and exacerbate U.S. social unrest in support of its interference objectives.[65]

---

[62] Pathé's father Charles was a famous, successful businessman known for popularizing phonograph records and essentially pioneering the film industry in early 20th century France, and he invented many popular techniques and tropes along the way. The media production and distribution conglomerate he created, Pathé Frères, has remained in operation since 1896. Shultz and Godson, 135.

[65] Notably, the CPUSA has long outlived its Soviet benefactor. Though it has not formally fielded a presidential ticket since activist Angela Davis shared the ticket with CPUSA leader Gus Hall in 1984, the party proudly claimed elected city council representatives in Wisconsin and Pennsylvania as of 2020.

Page 3104 of 3957

After anti-communist sentiment in the United States began to crest at the onset of the Cold War, the Soviets made extensive use of international and multinational front organizations; many of them ostensibly dedicated to such laudable causes as disarmament or world peace.[66] This more subtle approach enabled the KGB to recruit potential sympathizers and unwitting allies who not only worked intentionally or directly to aid the Kremlin, but also gave the Soviet Union Trojan Horse-like propaganda dissemination and information gathering outlets within countries where overt Soviet influence would not be tolerated.[67] Perhaps the best known of these organizations is the World Peace Council (WPC), founded in 1950.[68] Along with such partners as the World Federation of Trade Unions and the dubiously named World Federation of Democratic Youth, the WPC led protests throughout Western democratic nations for several decades and published materials intended to generate mass anger against U.S. weapons development.[69] Specifically, these organizations produced inflammatory and spurious literature falsely accusing the United States of such crimes as conducting biological warfare in the Korean War.[70] These organizations were later used to foment domestic and international outrage against U.S. activity in the Vietnam War, followed by a sustained campaign to discredit and split or dissolve NATO including hosting an annual "Stockholm Conference on Vietnam" and supporting "anti–neutron-bomb" protests in European NATO member states.[71] Perhaps tipping their hand, these organizations nearly unanimously ignored the Soviet military buildup and such Soviet-dominated alliances as the Warsaw Pact. When they had to acknowledge them, these organizations defended them as Soviets' "alliances,"

as well as being a necessary defensive posture, even as they called for U.S. disarmament in the interest of global peace.[72]

3. Forgeries and Rumors

Yet another method used by the Soviet Union to sway popular opinion and breed mistrust of the U.S. government among U.S. and allied citizens was through the creation and planting of forged documents and letters.[73] Soviet-made materials with meticulously mimicked Western handwriting, syntax, and signatures were disseminated both by Soviet-compromised publications, and by neutral or anti-Soviet publications duped by the fabrications; for example, the 1968 Office of Naval Research epidemic weapon forgery carried by the Indian press.[74] Contentious and painful social issues within U.S. society, such as the civil rights struggle, a rash of high-profile assassinations, and heated arguments about the U.S. military's role in the Vietnam War, were popular targets for forgery and slander attacks. Manipulation of the press to introduce or reproduce the KGB-generated allegations and false documents played a key role in helping rumors, doubt, and lies to spread throughout U.S. society.

According to Mitrokhin, the KGB launched a campaign to reduce the influence of nonviolent civil rights champion Martin Luther King, Jr. in favor of Stokely Carmichael, whom the Soviet Union saw as more radical and likely to incite violence and division.[75] KGB leaders authorized implantation of articles in English-language newspapers in African countries slandering King, ostensibly written by Black opponents of his ministry and movement.[76] Hoping these articles would be reprinted in U.S. newspapers, Soviet authors used such incendiary Western racial terms as "Uncle Tom" to describe King, and produced forged documents indicating that he was a paid mole injected into the movement

by the Johnson administration.[77] When King's assassination the following year led to nationwide unrest and riots, the disinformation department quickly reversed course and began using its press operations to hail King as a martyr whose murder traced back to U.S. government attempts to silence him.[78]

Concurrently, the Mitrokhin archive chronicles KGB financing and assistance to publishers and authors responsible for advancing conspiracy theories that the CIA orchestrated the 1963 assassinations of Kennedy and his killer, Lee Harvey Oswald.[79] In hopes of capitalizing on popular mistrust created by President Richard Nixon's career-ending Watergate scandal a decade later, the disinformation department also created and circulated a forged request for information—ostensibly from Oswald—to disgraced Watergate operative and former CIA agent E. Howard Hunt, in an effort to further imply that the CIA was behind Kennedy's murder.[80] Though the KGB's clumsy use of initials in this forgery led some readers to conclude erroneously that a right-wing oil magnate with the same surname was its ostensible recipient, the letter's subsequent publishing and "verification" by multiple handwriting experts helped accomplish the main goal of convincing some Americans that CIA operatives had killed the President.[81]

Similar forgery efforts sought to frame FBI chief J. Edgar Hoover on a variety of fronts, including that he was alternately a right-wing extremist, a corrupt abuser of the FBI office, and even a secret transvestite bent on seeding the FBI with fellow homosexual activists.[82] Though some of the more outlandish insinuations against Hoover may have failed to gain mainstream credibility initially, such allegations as unproven speculation regarding Hoover's sexual preferences gained widespread acceptance within U.S. society

Page 3107 of 3957

and have continued to resurface for decades.[83] The lack of definitive evidence regarding aspects of Hoover's personal life makes it difficult to ascertain for certain whether Soviet operatives invented such stories or simply used its disinformation techniques to capitalize on existing rumors or even facts. Regardless, such techniques amplified public awareness of controversial Hoover rumors at the very least, and demonstrate that Kremlin interference efforts included both disinformation and amplification of legitimate information it felt was advantageous yet getting insufficient attention organically.

4. Manipulating Multiple Sides, Instigating Groups against Each Other, and Inciting Violence

In some cases, Kremlin subversive measures sought to create kinetic impact and create physical casualties. Evidence of such attempts highlights the multi-faceted nature of Soviet interference techniques and the multilateral danger to U.S. interests presented therein. For example, Mitrokhin's smuggled KGB archive details a diabolical plot to exacerbate racial tensions in the 1960s, seeking not just to provoke conflicts and arguments or influence political narratives but actually to incite violence within U.S. society. One of the most alarming examples is a 1971 plot, codenamed "Operation Pandora," to detonate an explosive device at a predominantly Black college in New York and anonymously call several Black organizations attributing the explosion to the Jewish Defense League (JDL).[84] Mitrokhin's notes indicate that this idea was not an isolated one but rather one element of an elaborate campaign to incite a deadly race war between Jewish and African-American communities. To accomplish this plot, the Soviets produced insulting racist material made to look like it was written by the JDL and distributed the letters to militant black power groups. Along with these forgeries, the Soviets sent anonymous letters to African-American organizations listing made-up atrocities against the Black community committed by the JDL, and calling Black citizens to retaliate violently against the league's leadership. Whether such plots were designed to harm the future electoral prospects of presidents Lyndon Johnson or Nixon, tarnish the U.S. reputation internationally, or simply

[83] Andrew and Mitrokhin, 236.

[84] Andrew and Mitrokhin, 238.

Page 3108 of 3957

to cause ongoing division or chaos as a more general goal is unclear, but each is plausible in the context of concurrent Soviet disinformation schemes. Whatever the aim, attempts to create tangible impacts and casualties added a dangerous new dimension to Soviet interference operations beyond propaganda, bribes, and disinformation.

5. Diminishing Returns, Lasting Impacts

Moscow's various strategies in its interference campaigns during the Cold War demonstrate the breadth and adaptability of its subversive influence arsenal, but such diversity may have been born of necessity or pragmatism as some of its most successful tools began to lose power with repeat usage. Most of the Soviet active measures and disinformation tactics achieved varying levels of success over the course of the Cold War, but many waned in effectiveness as targets began to identify them or at least grow reasonably suspicious. For example, Western observers eventually caught on to the robust forgery operations, and occasionally managed to undermine their effectiveness by shining a light on the practice. One such failed operation was a KGB attempt to deflect blame for a 1981 assassination attempt against Pope John Paul II away from itself and onto the CIA. In this incident, two forgeries purported to be cables from the U.S. embassy in Rome were published by a communist-friendly Italian newspaper, but quickly discredited due to formatting errors and correctly labeled a "Soviet active measure" by other Italian newspapers.[85] Another diabolical yet ineffective operation involved sending forged letters purportedly from the Ku Klux Klan to African and Asian nations ahead of the 1984 Summer Olympic Games in Los Angeles warning that Black athletes would be shot, burned, or lynched if they attempted to compete.[86] Such apparent misfires do not indicate a broader failure of Soviet influence operations, however. To the contrary, the presence of seemingly unsuccessful attempts amid a series of successes merely indicates that the Kremlin's subversion strategy involves placing a large number of low-risk bets, or lighting

a series of small flames to see which ones ignite into destructive fires. It is also notable that some attempts, such as the Kennedy assassination forgery project, lay dormant for years before eventually bearing fruit and enduring for decades.

Despite growing Western awareness of Soviet dezinformatsiya and U.S. efforts to challenge it aggressively under Ronald Reagan's administration, many active measures plots continued to achieve some degree of success, even during the tentative thaw in U.S.-Russia relations, and even after being positively identified as disinformation. In 1983, the KGB published a fake letter in *Patriot*, an Indian newspaper formed two decades earlier with Soviet aid for the purpose of seeding disinformation.[87] The letter, ostensibly from an American scientist who wished to remain anonymous, claimed that the burgeoning human immunodeficiency virus/acquired immunodeficiency syndrome (HIV/AIDS) virus had been developed by the Pentagon as a biological-weapons experiment.[88] After the letter initially failed to gain international attention, a spurious scientific paper crafted by Kremlin loyalists in East Germany was issued to bolster it, with Soviet press deliberately misidentifying the paper's origin as French to further obscure the Kremlin connection.[89] While other Soviet proxies around the world spread stories related to and building on the Pentagon/AIDS myth, traditional Soviet media in turn amplified them, and by 1987, the story had been shared in more than 30 languages and 80 countries.[90] More than 35 years since the Soviet Union set out to convince the world that the U.S. government had created the AIDS virus, and more than 25 years after the KGB admitted the entire ploy, U.S. and global public health officials and medical workers continue to struggle against popular

acceptance of the fabrication and the knock-on consequences of it.[91] For example, a 2005 study revealed that more than one out of every four African-Americans surveyed believed that AIDS was produced in a government laboratory, and that more than 15 percent of respondents believed the government had created the virus to control or reduce the Black population.[92] As demonstrated by political controversy that jeopardized mass acceptance of a potential COVID-19 vaccine among U.S. citizens during a global pandemic in 2020, conspiracies that undermine the credibility of government administration of health resources, or frame the government for disease outbreaks, can have significant and durable negative political and public health impacts.[93]

B. CONTEMPORARY ADAPTATIONS AND NEW THREATS

Russian active measures and disinformation against the West did not end with the demise of the Cold War. Indeed, modern Russian influence campaign methods build on Soviet active measures and exploit new technology that appears to increase their effectiveness. This section borrows the framework of the previous section to demonstrate how recent Kremlin interference operatives have adopted and adapted the techniques of their forebears, and to highlight areas in which such tools may be even more potent today.

1. Media Manipulation

Sinikukka Saari noted in 2011 that Russia's "active measures" influence strategies were evolving to include:

> 1) Proactive political involvement, e.g. creating links to a variety of political actors, assisting reorganisation and coordination of pro-Russian parties, export of political technologies and consultation around elections, 2) 'NGO diplomacy' e.g. creating and assisting pro-Russian youth groups, minority and separatist civil organisations and think tanks, [and] 3) Creation and management of favourable media environment, e.g. the establishment of Russian media ventures, launching media campaigns in the Russian media, or influencing the local national media.[94]

To Saari's last point, modern Russian media ventures have been used as an integral tool in its interference campaigns against Western democracies, overtly operating within the states it seeks to influence.

Since 2005, the Russian government has operated and expanded its own international media outlets, for example the television and online video enterprise RT (originally called Russia Today) and the internet-based news and commentary agency Sputnik. Both widely regarded by Western intelligence sources as mouthpieces of official Kremlin propaganda, these outlets have established multi-language ventures throughout the world and used a range of marketing strategies to build a substantial public audience. RT, Sputnik, and other government-sponsored Russian outlets with an international outreach mission provide factual coverage and interesting content on a variety of topics, yet they also clearly support agendas and messages that the Kremlin wishes to spread.[95] These outlets amplify news and opinions Russia wishes to promote, whitewash or cast doubt on the veracity of negative stories involving Russian interests, promote conspiratorial theories and interpretations, and give remarkably high amounts of coverage and airtime to representatives of political groups and parties seen as controversial or "fringe."[96] Opinions Russia wishes to promote with its news broadcast networks include

[96] "Shadow Puppets: Russian Meddling in Europe," *The Economist*, April 15, 2017.

denigration of NATO and defense of Russia's 2014 annexation of Ukraine's Crimean peninsula.[97] Examples of conspiracy promotion include attempts to portray the shootdown of Malaysian Airlines Flight MH17, said to be done accidentally by Kremlin proxies in occupied east Ukraine with a Russian anti-aircraft missile, and GRU agents' alleged poisoning of a former Russian spy in Great Britain, as deliberate acts perpetrated by rivals scheming to frame and slander Moscow.[98]

At times, Russian officials have openly acknowledged these media outlets' purpose as a powerful tool or even weapon against the Western world. In explaining the importance of RT's American TV channel in 2011, editor-in-chief Margarita Simonyan appeared to hint at the network's role as a strategic defense weapon:

> It's important that there is a channel that people are used to, that they like, so then when you need to, you show them what you need to show them. In a sense, not having your own "inoveshaniye" [foreign broadcasting] is the same as not having a ministry of defense. When there is no war, it seems as though it is not necessary. But damn, when there is war, it's absolutely critical. But you can't create an army a week before the war begins.[99]

In a satellite video appearance with the president of Argentina commemorating the beginning of RT's Spanish-language broadcasting in South America in 2014, Putin himself stated, "With accelerated development of electronic media, this sphere has acquired immense importance and has perhaps become a formidable weapon to potentially manipulate public consciousness."[100]

Page 3113 of 3957

It is no surprise, then, that an interagency report on Russian interference published in 2017 by the Director of National Intelligence concluded that RT and Sputnik are key components of "Russia's state-run propaganda machine" and a vital tool in its foreign influence campaigns.[101]

According to a 2019 study from King's College London analyzing all English-language content produced by RT and Sputnik during two four-week periods in 2017 and 2018, the Kremlin news agencies flooded the market with more than 2,100 articles highlighting political dysfunction in Western countries and Ukraine, which represented 81.7 percent of all content the agencies wrote about these nations.[102] Of the March 2018 RT and Sputnik articles studied, a staggering 138 of them sought to sow confusion and doubt about the Kremlin's recent poisoning of a former spy in the United Kingdom, in many cases by offering competing and contradictory counternarratives, such as lies that the U.S. or British government created the Novichok poison used in the attack.[103] Such misdirection and noise are hallmarks of RT and Sputnik's defense of Kremlin scandals, particularly regarding infamous large-scale incidents such as the Russian military's seizure of the Crimea peninsula and the downing of Malaysian Airlines Flight MH17.[104] The anti-Ukrainian rhetoric and dishonesty coming from Russia's English-language RT channels in London and the United States during these two events were so prolific and reprehensible that two of its anchors publicly resigned out of frustration with the network's deceptive

Page 3114 of 3957

reporting, while a third forcefully condemned the network's disinformation campaign on air during a live broadcast.[105]

Disturbingly, the King's College report also discovered that RT and Sputnik's English-language content infected British news sources as well; 21 different articles across five prominent British newspapers in an eight-week sample replicated at least 30 percent of the text found in articles that RT or Sputnik had published previously, including 11 directly related to political issues.[106] Only two of the 21 articles gave credit or attribution to the earlier RT or Sputnik articles, meaning British audiences had no reason to suspect a Kremlin-friendly bias. Taken alongside other studies' findings, for example a report that conspiracy-minded U.S. media outlet InfoWars had republished more than 1,000 RT articles, it appears that the old Soviet method of publishing stories with the hope that Western media outlets would later amplify their messages is now more successful than ever.[107]

Government-run propagandistic media outlets represent only the tip of the iceberg of Russia's modern-day foreign influence apparatus, however. Beneath the surface, the Kremlin also appears to continue employing such practices as co-opting journalists and covertly manipulating the foreign press, playing puppet master to proxy organizations designed to stir up social divisions, fabricating and spreading false information, and providing material and financial support to foreign political candidates and campaigns.[108]

a. Co-opting Journalists and Using Outside Media to Influence News Coverage

Echoing past Soviet use of Indian, East German, and African publications to hide its authorship of disinformation, the internet is awash with obscure and low-level news portals throughout the world that fail to disclose the editorial control or influence of the Kremlin. In particular, the FSB and Russia's Main Intelligence Directorate of the Russian General Staff (GRU), work with loyal supporters to enact this scheme.[109] Hungarian news media website Hídfő.net, whose content was eventually found to have been almost entirely produced by Russia's GRU, was used to dramatic effect in a Kremlin campaign to turn Ukraine's neighbors against its fledgling post-revolutionary government.[110] The site caused a massive uproar by falsely reporting that Hungarian tanks had been seen rolling across the Ukrainian border.[111] The site also published false assertions regarding such topics as Crimea-related sanctions, the 2016 U.S. presidential election, NATO aggression, and an "exposé" alleging a U.S.-run hybrid war campaign against its rivals.[112] As in Soviet times, the site's articles could be cited by the Russian media as though it were a credible foreign news source, without the stories appearing to be state-generated propaganda.

b. Inventing and Planting Stories in the Internet Age

As the hidfo.net incident illustrates, the Kremlin is able to leverage such significant technological advances as the internet to enhance the efficiency and expand the reach of Soviet disinformation tools. In a hyper-connected digital age in which much of the world receives information from sources outside traditional news networks, Russia is now able to accomplish its goals of spreading disinformation without needing to explicitly

compromise or exploit journalists or news publications, nor even to create its own Western-leaning information portals. The advent of social media, in particular, has helped modern Russian influence campaigns reach an exponentially wider audience than Soviet operations were able to, and with considerably less difficulty and risk.

Since at least 2013, active measures harnessing the power of the internet and social media to stoke artificial public interest in a topic, spread disinformation, and attack Russia's foes have proliferated.[113] *Novaya Gazeta*, a Moscow newspaper whose critical investigative work since Putin rose to power is believed to have prompted the assassination of several of its prominent employees, reported in August 2013 that its journalists had infiltrated a St. Petersburg "troll factory" called Internet Research Agency (IRA).[114] The IRA offered weekly salaries and free food to employees for writing blogs, article comments, and social media posts on prescribed themes.[115] According to this exposé, young Russian citizens working for the agency were given a list of topics and targets about which to produce content across Russian and Western traditional and social media.[116] These topics included praise for Putin, the Group of Twenty (G20) summit (held in St. Petersburg that year), and Russian activity in the Syrian war, along with negative content directed at Russian opposition politician Aleksei Navalny, *Forbes* magazine, and various American entities. Burnished by other media reports corroborating these findings, the *Novaya Gazeta* investigation discovered that similar operations were planned for or already working in Moscow, and also found evidence that the agency's influence campaign

[116] Garmazhapova.

predated its July 2013 business registration.[117] Subscribers to British newspaper *The Guardian* complained that the online comment section of articles related to Ukraine's ongoing revolution were all so inundated by a torrent of Kremlin-friendly propaganda that legitimate conversation was impossible.[118] A May 2014 column filed by *The Guardian*'s readers' editor in response recalled that the newspaper had reported two years earlier about Russian troll influence campaigns, implying that it had subsequently become a target of such attacks.[119] Indeed, a February 2012 *Guardian* report about hacked emails to and from the leader of a Russian political youth organization, many of which dated back at least to 2010, outlines a well-financed campaign to amplify pro-Russia internet content and smear a list of 168 enemies of the organization, including Navalny, journalists, and human rights activists, on social media and blog sites.[120]

A 2018 RAND Corporation analysis posits that the Kremlin's interest in social media information warfare may have stemmed from Putin believing that such mass unrest incidents as the 2011 Moscow post-election protests and various revolutions in former Soviet republics had been fomented by the United States and coordinated via Facebook and Twitter.[121] These U.S.-based social media platforms were widely reported as critical tools for the launch and coordination of revolutionary uprisings in Egypt and Tunisia that same year, which Putin decried as U.S.-orchestrated interference in his speech justifying

the annexation of Crimea.[122] This perception may have cemented Putin's resolve to build up Russia's so-called "information confrontation" capability to counter what he believed to be a grave new American threat. Though a number of studies later found that the role of social media in the Arab Spring had been somewhat overstated, the 2014 Ukrainian revolution that prompted Putin's seizure of Crimea would have nevertheless proven this hypothesis anyway.[123] The mass demonstrations in Kyiv that year began with a journalist's Facebook post and relied heavily on social media to organize protests, recruit volunteers, and capture the attention of the Western world.[124]

Following *The Guardian*'s report, and increasingly cognizant of robust pro-Russia sentiment within the comment sections of prominent news sites, the American news media gradually began to take notice of the story. News and entertainment aggregator site Buzzfeed published a lengthy exposé in June 2014 that used leaked emails from alleged troll factory financiers to describe the Russian troll operation in great detail.[125] The feature showed the troll factory to be a well-financed and sophisticated operation and revealed attempts to hire English tutors for employees, a list of such media targets as *Politico* and Fox News, and orders for employees to operate six active Facebook accounts or 10 Twitter accounts and post 50 comments to news sites per day. Yet, in response to the Buzzfeed article, a *Washington Post* column highlighting the newspaper's own interaction with suspected Kremlin trolls downplayed the impact of the alleged influence campaign and suggested that domestic commentators were clever enough to mock, refute, or ignore any

false claims from foreign invaders.[126] Though many outlets reported on the troll campaign as a nuisance offshoot of Russia's adventurism in Crimea, none seemed at the time to recognize it as a threat to U.S. domestic affairs, and neither did prominent U.S. officials.

By April 2015, "malicious cyber activity" was well known and taken seriously enough that President Barack Obama issued Executive Order 13694: Blocking the Property of Certain Persons Engaging in Significant Malicious Cyber-Enabled Activities. This order was a directive declaring a national emergency and threatening harsh sanctions on any foreign actors whose cyber activities threatened U.S. national or economic security, financial stability, or foreign policy.[127] Regrettably, in what now seems like a colossal oversight and missed opportunity, the focus around this executive order did not appear to include Russian troll activity. Rather, the text of the executive order centered on such contemporary events as financial cyber crimes, state-sponsored Chinese hacking for the purposes of espionage and intellectual property theft, ISIS propaganda and recruitment through social media, and an incident in which North Korea levied a crippling hacking operation on Sony Pictures in retaliation for its production of a film depicting the assassination of Kim Jong Un.[128] Notably, Obama attempted to correct this oversight in the waning days of his presidency by issuing Executive Order 13757: Taking Additional Steps

---

[126] The *Washington Post* article focused on flagrantly absurd Russian comments, summarizing one thusly: "Halloo, egghead! Let's go! "Oink-oink-oink-oink-oink …" hahaha-haha-ha….)))))))))) [He then launches into an anti-American screed in Russian.]," as well as typical banter, such as a seemingly domestic commentator rapidly responding dismissively to a comment that Obama should avoid involvement with Ukraine-Russia conflict. It did not appear to account for the possibility of more subtle efforts to stir up division without revealing pro-Russian bias. to Address the National Emergency with Respect to Significant Malicious Cyber-Enabled Activities to amend Executive Order 13694 after Russia's 2016 election interference.[129]

2. Proxy Organizations

Just as the Soviet Union was able to implant advocates for its causes and policies into foreign states' political and social environments via surrogates such as the CPUSA and WPC, modern Russia offers support and assistance to (and sometimes creates) proxy organizations in the West. This strategy includes support for oft-discounted political parties in other countries, including neo-Nazis and white supremacists.[130] As in the Soviet past, this support and these alliances had nothing to do with shared ideology and everything to do with perceived usefulness to national goals; especially regarding potential collaborators who could assist against a shared enemy. Just as with the leaders of Cuba, North Korea, Vietnam, and such non-communist nations as Egypt and Iraq during Soviet rule, the key question was who was the enemy. The enemy of Moscow's enemy (the West and the United States) was thus the Kremlin's friend.[131]

András Rácz describes Russia's strategy as "scattershot… placing small bets, directly or through proxies, on ready-made fringe groups in an effort to destabilize or simply disorient" such rivals as the EU.[132] An Atlantic Council report titled *The Kremlin's Trojan Horses* agreed and warned that Russia was waging a subtle destabilization effort focused on:

> (1) building political alliances with ideologically friendly political group and individuals, and (2) establishing pro-Russian organizations in civil

> society, which help to legitimate and diffuse the regime's point of view. The web of political networks is hidden and nontransparent by design, making it purposely difficult to expose. Traceable financial links would inevitably make Moscow's enterprise less effective: when ostensibly independent political figures call for closer relations with Russia, the removal of sanctions, or criticize the EU and NATO, it legitimizes the Kremlin's worldview. It is far less effective, from the Kremlin's point of view, to have such statements come from individuals or organizations known to be on the Kremlin's payroll.[133]

The appearance of Russia's support for fringe groups is alarming for a variety of reasons, especially its apparent effect of amplifying far right, ultranationalist, and even neo-Nazi parties and organizations in Slovakia, Austria, France, Germany, Hungary, and other Western nations.[134] Alleged beneficiaries of Russian support include members of European Parliament representing such far-right or nationalist parties as Alternative for Germany and France's National Rally (formerly National Front), as well as such agitator organizations as Austrian Technologies GmbH and Italy's Eurasia Coordination Project.[135] A common thread among the majority of these disparate fringe groups with Kremlin backing has been their assertion that Russia's annexation of Crimea was legitimate and that the sanctions levied as a result of it should be repealed.[136] Another use for this hodgepodge of policy-agnostic alliances also seems to be their members' participation as monitors, neutral observers, or official recognizers of elections in Russia or its intended sphere of influence, where they can dubiously vouch for or cast doubt on the elections' credibility and fairness.[137]

Page 3122 of 3957

These parties and groups can also be used to cause problems domestically, for example, sowing domestic unrest and stymieing the work of their nations' governments from within using veto power or obstructionism. Even support for less successful fringe parties has a detrimental effect on the nations in which they practice. In October 2016, septuagenarian neo-Nazi Istvan Gyorkos, leader of a small organization known as the Hungarian National Front, murdered a police officer during a raid on his illegal weapons cache in a western Hungarian village.[138] A parliamentary committee later briefed on the incident by the intelligence community was informed that Gyorkos had been under surveillance for years due in part to collaboration with extremists in Russia, and that Russian GRU military intelligence personnel posing as diplomats had regularly engaged in combat drills with him and his followers.[139]

Support for a tiny militant and antagonistic party in Hungary seems duplicitous considering the warm relations already established between the Kremlin and both Hungary's prime minister Viktor Orban, and his leading challenger, the Jobbik Party.[140] Russian support for groups that glorify or co-opt the fascist ideology of the Soviet Union's bitterly hated World War II opponent seems even more jarring. These seeming contradictions, however, underscore the assertion that Russia is willing to place small bets on a plurality of parties, so long as they show signs of being able to weaken the powers that be or disrupt the European status quo. Since such support is pragmatic and sinister rather than ideological, even groups with policies and worldviews antithetical to those of the Russian government may still receive assistance. Such is the case throughout Europe; political parties strongly rumored to have Russian backing in Germany include the left-leaning Social Democratic Party, hard-left Die Linke, and far-right Alternative für

Page 3123 of 3957

Deutschland.[141] In Greece, the ruling far-left Syriza party has come under fire due to its rumored Russian financing and ties to such radical Russian nationalists as Alexander Dugin, who is also accused of supporting far-right neo-Nazi opposition party Golden Dawn.[142] The story is similar in Italy, where the resurrected center-right Forza Italia party and right-leaning nationalist Lega Nord parties are both believed to enjoy Russian backing.[143] The United Kingdom's British National Party and UK Independence Party have drawn suspicion on this subject as well due to the effusive praise heaped on Putin by some of their members and the alleged Russian interference in their favor during the Brexit referendum.[144] The evident promiscuity of Russia's foreign political support, even to multiple fringe candidates within a single country, reveals that an aspect of the Kremlin's strategy is to amass a large number of levers to pull in the name of destabilization and ability to impose its will on foreign governments; it is accumulating spoilers and trump cards wherever it can.

Alarm bells about Russian influence sounded in Spain almost immediately upon an explosion of chaos and violence centered on a secessionist movement in Catalonia in September 2017. Citing Catalonian disinformation, Russian media amplification, and Russian Twitter bots' frenzied sharing of both, Spanish media quickly speculated that a

---

[141] One notable instance of Russian support for Germany's Social Democratic Party is its relationship with former German Chancellor and SDP leader Gerhard Schröder. After a setback in Germany's federal election cost him the Chancellorship, he announced his resignation and then controversially signed a deal allowing Russia to build a gas pipeline between the two nations under the Baltic Sea just before his final day in office. Russia, to which the pipeline carried enormous strategic importance, swiftly rewarded Schröder for his assistance by naming him the head of shareholders for the pipeline project and hiring him to a lucrative position as board chairman for the nation's ROSNEFT energy company. Schröder has since served as a reliable defender of controversial Russian actions in the news to include partially rationalizing the Crimea annexation. Page 3124 of 3957

Kremlin hand had been stirring the pot.[145] Subsequent reports from German and Spanish intelligence agencies later found that a surge of Russian disinformation and support had indeed been a key provocation for Catalonia's illegal separatist referendum and the bloody riot that followed.[146]

The 2016 Internet Research Agency Facebook advertisements included a series of conservative-targeting posts calling for Texas's secession from the Union; a campaign that all but disappeared after the election but may have intensified had Clinton won.[147] On the other end of the political spectrum, RT reported within one month of Trump's victory that an "embassy" dedicated to California's secession from the United States had been opened in an expensive area of downtown Moscow.[148] Contemporaneous reporting from more credible news outlets revealed that the California secessionist behind this apparent stunt was a New York-born Russophile and Russian resident with a history of right-wing U.S. political activism.[149] It was soon discovered that the dubious diplomatic outpost managed to secure its improbable real estate bonanza only because the space was being provided for free by a Kremlin-financed party that was also supporting a fledgling Texas rebellion.[150]

[150] Lister and Sebastian; Reevell, "Texas, California Separatists Attend Kremlin-Funded Conference."

The Anti-Globalization Movement of Russia, as this group is called, exists to offer support and encouragement to separatists in nations all over the world.[151]

At a Senate Intelligence Committee hearing regarding Russia's social media influence campaigns in November 2017, Russia was accused of using social media bots, state media amplification, and even clandestine financial and material aid to support and amplify recent secession movements.[152] Among these campaigns were Catalonia's contentious unauthorized referendum against Spain in 2017, a narrowly defeated 2014 referendum regarding Scotland's independence from the United Kingdom, the United Kingdom's unexpected 2016 vote to exit the European Union, illegal sham referenda in Crimea and Ukraine's Donbass region in 2014, and activity in other "frozen conflict" zones.[153] Evidence presented at this hearing suggested that Russia also attempted to provoke Hawaiian, Puerto Rican, and Native American tribal rebellion in addition to the Texas secession.[154] Russian support for secession movements serves as evidence of a broad trial-and-error strategy. That Russia appears to have directly advocated violence and fear among U.S. citizens and attempted to coordinate confrontations between rival groups in 2016, further reinforces the notion that they are experimenting with ways to stoke something akin to a civil war or unrest reminiscent of Soviet race war plots in the 1960s.[155] This notion is further bolstered by such stunts as an incendiary Internet Research Agency troll group called Black Fist funding self-defense classes for African-American activists

---

[151] Not only can secession movements cause chaos and force national governments to focus attention and resources on internal matters, they also serve as a useful propaganda tool for Russia to justify and normalize its near-universally condemned takeover of Crimea. Reevell, "Texas, California Separatists Attend Kremlin-Funded Conference."

throughout the United States ahead of the election.[156] With sometimes-violent unrest popping up in cities across the United States in 2020 over coronavirus mitigation measures, political campaigns, election results, and social justice issues—including at least one foiled plot to assassinate a state governor and provoke a rebellion—some of Russia's longshot bets have a legitimate chance of paying out to some degree.[157]

3. New Threats and Force Multipliers: Cyberattacks

In addition to the resurgence of active measures techniques that appeared dormant in the years following the collapse of the Soviet Union, new tactics have emerged as complements and accelerants to such measures in present-day influence campaigns. In many cases, longstanding interference methods have adapted and improved, often with the benefit of technological advances, such as the internet and social media. Espionage, reconnaissance, propaganda distribution, recruitment, and many other elements of interference tradecraft have been made much easier and more successful by the availability of data and social media on the internet. Contemporary Russia has thus been able to expand greatly the size and scope of its activities compared to Soviet influence efforts. Along with legal means of information harvesting and dissemination, Russia uses the internet as a powerful new toolset for its influence campaigns: cyberattacks, to include hacking, infrastructure disruption, and file manipulation.

Twenty-first-century Russian hacking operations have proven to be useful disruptors in their own right, as well as accelerators for other influence methods, such as

slander, forgery, and political influence. The information obtained from a hack can be used to inform future influence campaigns, identify vulnerabilities and strategies that can be exploited and countered, or to embarrass or compromise the target upon public release.[158] Worse yet, the stolen material can even be doctored to create compromising material where none naturally exists.[159] The theft or even insinuation of theft of sensitive information can be used as blackmail if release is threatened. Finally, attribution of a cyberattack's origin can be difficult, so a perpetrator can avoid detection, and thus also avoid consequences. It is in this space that Russian influence campaigns have been masterful. Cyberattacks are now a staple of the Kremlin's influence campaigns, whether targeting a nation's candidates, election systems, government services, or even critical infrastructure sectors.[160]

The ways in which any hostile power could conceivably disrupt infrastructure or commerce grows with every new interconnected device and advance in networking, limited only by a potential attacker's capacity and the intended victim's ability to thwart, punish, or effectively counterattack. By this metric, the threats posed by Russian cyberattacks are among the most severe imaginable, as the GRU has spent years honing its craft. Also in the Kremlin's favor is the fact that its nuclear weapons arsenal provides the ultimate strategic defense against a physical or military counterattack to its cyber meddling; an advantage very few of the world's other hackers and groups can boast. As the full range of possible cyberattack capabilities is too broad to list, it may be more useful to analyze actions allegedly already taken by Kremlin agents.

A bellwether case study for the havoc Russian-origin cyberattacks can wreak on a society is a 2007 Estonian cyberattack. In the wake of Estonian authorities' decision to move a controversial Soviet World War II memorial from downtown Tallinn to a military cemetery, and fueled by disinformation on Russian-language media saying the monument

Page 3128 of 3957

was set to be destroyed, riots among the Russian-language population ensued. The following night, Estonian network systems were beset by a weeks-long siege including computer script-driven "distributed denial of service" (DDoS) attacks that caused sporadic outages in the banking, media, and government sectors, to include failure of automated teller machines, public servant email accounts, and news broadcasts. In a taunting and unpersuasive denial, Putin wryly suggested the attack might have been the work of independent "patriotic hackers" motivated by love for Russia and incensed at the exaggerated news of the statue's removal rather than official state actors.[161] The Russian government refused to assist Estonian law enforcement's investigation of the perpetrators despite a standing treaty compelling them to do so, and significant evidence that the attack originated with Russian IP addresses.[162]

This incident, which rattled Estonian society and led the government to bolster its cybersecurity posture significantly, offered an example of the unpredictable chaos Russia could unleash on a foe under the guise of domestic tensions and difficult-to-attribute cyberattacks. The attack also put Russia's potential foes on notice that the nation is capable of inflicting substantial damage on a rival society without crossing a border or firing a shot. Perhaps most troubling to U.S. observers, the Estonian attack hinted at Russia's apparent ability and willingness to wound a NATO member state at a significant level without triggering the alliance's Article Five agreement, which states that an attack against any member is an attack against all and must be met with a unified response.[163]

Perhaps less risky for Russia though is the following option: a hybrid campaign that cripples essential services in a NATO country via a devastating yet difficult to definitively attribute cyberattack, yet does not involve physical weaponry deployment or border

Page 3129 of 3957

incursion. Such a "gray area" attack could trigger alliance infighting and a lack of consensus regarding a full-scale Article Five response, thus undermining the alliance's main purpose. Perhaps cognizant of such a novel scenario, NATO quickly founded the Cooperative Cyber Defence Center of Excellence in Tallinn not long after the 2007 Estonian cyberattack.[164] More than a decade after the Estonia incident, however, ambiguity continues to surround each NATO member's stance on the threshold a cyberattack must hit before signifying an act of war. Questions include whether it makes a difference if the attack is definitely state-sponsored or possibly carried out by its "patriotic" residents (as Putin has smugly suggested more than once), and whether it is definitively safe to declare a cyberattack an act of war while also engaging in offensive cyber activity, such as Stuxnet (a malicious cyber worm of alleged U.S. and Israeli origin used to damage Iran's nuclear program severely).[165] A June 2017 statement issued by NATO Secretary General Jens Stoltenberg in the wake of a mysterious global cyberattack hinted that questions still remain even as the alliance seeks to harden its cyber defenses, as he warned those responsible that NATO nations had agreed that a cyberattack *could* trigger Article Five (emphasis added).[166]

Notably, the attack Stoltenberg referred to (known as "NotPetya") originated in Ukrainian tax software and wreaked havoc on the nation in a manner similar to the 2007 Estonia attack, before spreading sporadically and uncontrollably to public and private sector entities worldwide. U.S. CIA and British intelligence reports identified with high

confidence the GRU as the perpetrator for this attack, which concurred with earlier Ukrainian intelligence assessments.[167]

Whereas NotPetya may have been an out-of-control juggernaut affecting as many sectors as possible, Russia has demonstrated that it can also target infrastructure and communications equipment with precision. In June 2015, 12-channel French television network TV5 Monde was hit with a devastating cyberattack that appeared to have been meticulously tailored to destroy its broadcast transmission hardware.[168] Seven different components simultaneously fell under attack, including a Netherlands-based remote-control camera company used by the network. The network website was maliciously reprogrammed to display a message indicating the Islamic State took credit for the mayhem, but French authorities quickly traced the attack to the GRU.[169] Six months later, a well-coordinated and highly sophisticated remote takeover of multiple Ukrainian power grid control center distribution systems, later attributed to the GRU by the UK Cyber Security Centre, shut off power to hundreds of thousands of residents in western Ukraine.[170] The GRU has also been blamed by Western governments for a litany of infractions to include a pre-war attack on Georgia's government agency systems in 2008, the penetration of various Eastern European countries' defense ministries in 2014, and a significant 2015 network takeover and data destruction attack against Germany's

Bundestag parliamentary system.[171] In light of the broad array of cyber-based disruptions it has been practicing and refining, it is clear the Kremlin has a new toolset to deploy strategically as a means to sow division, influence, or thwart communications during a critical event or time period, and disrupt the normal functioning of a foreign government. For example, Russian operatives could unleash a precise, narrowly targeted attack against a media network during an election cycle that could materially affect voters' ability to access information about a candidate or result, or a targeted attack on critical infrastructure in a given municipality that could cause chaos and disruption at polling locations and undermine the integrity of the outcome.

4. Relative Impunity

When confronted with the fact that more than a dozen GRU operatives were under criminal indictment in the United States for cyber-based election interference, Putin denied that the suspects worked for the Russian government, demanded the United States reveal its evidence, and bluntly swore that Russia would never cooperate with other nations' attempts to prosecute its hackers: "Never. Never. Russia does not extradite its citizens to anyone."[172] By always denying responsibility for cyberattacks and refusing to extradite or cooperate with investigations, the Kremlin has mostly escaped consequences for these intrusions thus far, which has allowed them to enjoy a measure of freedom to test and refine their capabilities. Similarly, the risk of prosecution for an army of citizens paid through proxies to create and amplify disinformation on social media and hide behind fake foreign personas is low due to the high volume of content and relative anonymity of its operatives. Any rival nation's attempt at in-kind retaliation would likely be thwarted by the Russian government's strict control of the internet within its borders, which allows it to block any

content it chooses swiftly.[173] Finally, Russia's support and cultivation of fringe parties and organizations in rival states in some cases may give it allies capable of thwarting investigations into its interference, vetoing penalties such as sanctions, and sponsoring or attacking legislation to suit the Kremlin's interests.[174] Taken in aggregate, it becomes clear that in the current environment, Moscow has a large array of well-honed interference tools and little to dissuade it from using them.

III. ELECTION INTERFERENCE

This chapter focuses on a Russian interference attack type that may have the greatest potential for destructive, lasting impact: meddling and manipulation in the process of electing leaders in democratic societies. Russia's methods of foreign political interference were on full display in such pivotal world events as the 2016 U.S. presidential election, the "Brexit" referendum regarding Great Britain's membership in the EU, and other elections throughout Europe. Just as in Soviet times, some of the primary goals of this interference appear to include the weakening of Western rivals and alliances such as NATO, the promotion of leaders with favorable attitudes toward Moscow, attacks smearing politicians seen as hostile toward Russia, the deflection and denial of Russia's role in nefarious events, and the stoking of mistrust and division in Western societies.[175]

To understand U.S. vulnerability to Russian election interference and establish the plausibility of the threat, this chapter first details known instances of Soviet attempts to influence U.S. politicians and tilt the scales toward a Kremlin-favored outcome. Next, it analyzes the broad range of tools that Russia used in its bid to influence the 2016 U.S. presidential election. Finally, this chapter explores other recent instances of Russian meddling in Western elections to identify tactics and efficacy further.

A. SOVIET MEDDLING IN U.S. ELECTIONS

During the Cold War, Moscow made overt offers to potential U.S. presidential candidates on multiple occasions by offering to help them defeat anti-Kremlin rivals in exchange for the expectation of friendly treatment. For example, John Bartlow Martin reported in 1977 that Adlai Stevenson, the Democratic Party candidate whose unsuccessful 1952 and 1956 campaigns included nuclear nonproliferation rhetoric that Kremlin officials

[175] Perkins, "Soviet Active Measures Reborn," 7–9; Galkins, "NATO and Hybrid Conflict Unresolved Issues from the Past or Unresolvable Threats of the Present"; Ramsay and Robertshaw, *Weaponising News*, 69–91.

Page 3134 of 3957

saw as beneficial, reported one such overture.[176] According to Stevenson, Soviet ambassador Mikhail Menshikov set up a one-on-one meeting ahead of the 1960 presidential election to persuade him to run against sitting Vice President Richard Nixon.[177] To Stevenson's alarm, the ambassador offered to use the Soviet press to help him win election, in part by publishing either positive or critical stories about the campaign; whichever Stevenson thought would get him the most votes.[178]

Soviet leader Nikita Khrushchev later acknowledged that he continued to do everything in his power to prevent Nixon from winning the 1960 election, citing as motivation animosity following an infamously tense exchange between the two at an American technology exhibition the year before.[179] Aleksandr Feklisov, a Soviet spy serving as the KGB's Washington, DC, station chief during this time, later admitted to having been "instructed… to propose measures, diplomatic, propagandist, or other, to encourage [John F.] Kennedy's victory" and revealed that an agent had attempted to offer assistance to Kennedy's campaign against Nixon through his brother Robert F. Kennedy.[180]

Upon meeting President Kennedy for the first time after his victory, Khrushchev took credit for tipping the close race by bragging that he had weakened Nixon by refusing to release American pilots from Soviet captivity until after the election.[181] When Nixon again ran for president in 1968, Soviet intervention attempts were even more direct. Anatoly Dobrynin, Moscow's ambassador to the United States at the time, admitted

carrying out an order to offer campaign assistance secretly to Nixon's opponent Hubert Humphrey including financial aid.[182] Mitrokhin also notes that even after Nixon's resignation due to the Watergate scandal, then-KGB chairman Yuriy Andropov ordered his bureau to make overtures to officials in Nixon's administration—including speechwriter William Safire and eventual presidential candidate Pat Buchanan—in attempts to use them for the Soviet cause. In each case, the Americans refused the offers.[183]

Though most if not all U.S. politicians appear to have known better than to accept Soviet offers for aid, the practice may have still been of value to the KGB's active measures apparatus. Directly offering assistance to potential U.S. presidential candidates could have served multiple purposes: aside from providing the offered boost to the Kremlin's desired candidates, any accepted offer could have also served as leverage for blackmail or a foolproof way to ruin the acceptor's reputation should the relationship ever sour. In addition, any evidence that an offer of assistance was made, or that contact between foreign influence agents and anyone involved in a candidate's campaign or administration had taken place, could be used by that candidate's opponents or detractors. Opponents could use evidence of a Russian attempt to render aid to smear or slander the candidate as corrupt, even if the candidate rejected the offer. Additionally, if a credible suggestion that the Kremlin might have influenced a U.S. election or compromised a lawmaker were introduced in the American press or even leaked deliberately by Soviet agents, domestic and international belief in the legitimacy of elected leaders could be undermined, which would then lead to a constitutional crisis.

According to Mitrokhin's archives, the KGB launched a concerted effort to doom hawkish anti-Soviet Senator Henry "Scoop" Jackson's presidential aspirations in 1976 by forging FBI documents falsely indicating that he was a homosexual (at a time when U.S. voters were seen as likely to reject such a candidate), and distributing them to his political rivals, as well as popular magazines in hopes that the rumor would catch on.[184] Though no

evidence suggests these rumors played a significant role in derailing Jackson's presidential bid, the KGB continued attacking the Senator by disseminating forged documents regarding his sexual preferences more than a year after he ended his campaign.[185]

B. MODERN MEDDLING IN U.S. ELECTIONS

The initial years after the Soviet Union's collapse marked an apparent respite in concerted Russian attempts to influence the outcome of Western elections, but by the second decade of the twenty-first century, it became increasingly clear that the lull was over. Particularly since 2014, the concept and scope of Russian interference campaigns has become extremely well known in Western nations, even as Moscow issues repeated denials. Along with U.S. elections, allegations of Russian interference have surfaced in recent British, Bulgarian, German, French, Scottish, Spanish, and Ukrainian elections and referenda within a five-year period.[186] One of the largest and arguably most consequential Kremlin attempts to tip the scales for or against political candidates in recent years is the 2016 U.S. presidential election, in which a variety of mechanisms were allegedly deployed in support of candidate Donald Trump and against Putin foe Hillary Clinton. This section attempts to analyze the various subversive avenues Russia used in its attempt to sway the election, as well as a few others occurring in the same general timeframe, to include overt Russian media, social media, hacking theft, and other cyberattacks.

1. State-Run Media

In 2017, the U.S. Director of National Intelligence (DNI) released an interagency report on Russian interference in the 2016 presidential election, which revealed that the

Page 3137 of 3957

nation had used both overt and covert means to affect the outcome. This document extensively referenced state-owned media outlets RT and Sputnik and highlighted their role in attempting to tilt the previous year's U.S. presidential election in favor of Trump.[187] The report cites the Kremlin-backed media companies' frequent denigration of Democratic candidate Hillary Clinton and the U.S. presidential election process as a calculated, years-long program aimed specifically at damaging her electability. Russia's English-language media outlets are not only used to spread negative information, to be sure. These news networks also take advantage of their apparent legitimacy as news sources to boost coverage of events and political actors not widely covered by traditional media, and thus boost the candidates' profiles and expand their audiences. Far-left U.S. Green Party presidential candidate Jill Stein, derided by many Democratic Party supporters as an unserious candidate whose presence on the ballot served primarily to split the liberal vote, and thus, to benefit Republicans, received outsized support and publicity from RT and Sputnik during the 2012 and 2016 presidential campaigns.[188] Such support included a number of interviews and a primetime 2016-debate broadcast that allowed her to showcase her campaign platform.[189] Stein's enthusiastic appearance at a 2015 gala celebrating RT's 10th anniversary, along with her outspoken advocacy for such Kremlin obsessions as lifting Crimea-related sanctions and criticism of Ukraine, raised alarm in light of the DNI report.[190] Evidently suspicious of RT's outsized coverage of Stein, the U.S. Senate Investigative Committee in 2017 announced a probe of her campaign to look for evidence of illegal Russian support.[191] Stein denied any improper collusion with the Kremlin but

initially resisted cooperating with the investigations, and at least two separate reports commissioned by the U.S. Senate found strong evidence of longstanding Russian support for her campaigns beginning soon after RT's launch.[192] Such support was not unprecedented, as RT had also frequently played host to former Republican congressman Ron Paul, one of Stein's 2012 presidential election opponents.[193] For his part, Paul, who conducted three combative, nontraditional populist presidential campaigns as a Libertarian and a Republican, has been described as one of the most outspoken defenders of Putin ever to have held U.S. federal office.[194] RT also provided significant support and airtime to former Minnesota governor and professional wrestler Jesse Ventura, an avid conspiracy theorist and U.S. government critic who occasionally announces exploratory presidential campaigns.[195]

Though not a candidate himself, U.S. Lieutenant General Michael Flynn was also frequently invited to appear as a guest speaker on RT to advocate for positions supported by the Kremlin.[196] A sharp critic of U.S. foreign policy since being ousted from his role as President Obama's Defense Intelligence Agency director, Flynn found a very receptive

audience for his criticisms in RT.[197] Flynn's acceptance of $45,000 from the network to give a speech at the same network gala Stein attended later played a role in his forced resignation as President Trump's National Security Advisor due to improper contacts with the Russian ambassador before Obama's term ended, along with a federal indictment and trial that dragged on for the entirety of Trump's presidency.[198]

2. Social Media

On the covert side of its operation, Russia's attempts to interfere in the 2016 U.S. election made extensive use of its internet troll and bot armies on U.S.-based social media platforms. Even as Western newspapers began to grapple with the trolls' invasion of online comments sections, such social media titans as Facebook and Twitter appeared clueless or unconcerned by contrast. Just after Trump's victory in November 2016, Facebook founder Mark Zuckerberg publicly scoffed at accusations that fake news on social media or foreign manipulation of the platform had any noteworthy impact, and insisted, "to think it influenced the election in any way is a pretty crazy idea."[199]

At the same time, however, Facebook offered to embed staff in both the Trump and Clinton campaigns to help them use company algorithms to tailor paid content to optimal audiences; the company was clearly confident that its advertising service could be used to influence voters.[200] Additionally, the social media giant accepted Russian rubles as payment from a company buying more than $100,000 worth of divisive U.S. political ads; thus, arguably, Facebook also knew or should have known that foreign entities were using the platform to attempt to exert their own influence on the election.[201] See Figure 1. To Facebook's credit, it evidently had alerted the FBI of anomalous domestic political activity originating from Russia that it had detected on its platform in June 2016. Unfortunately, the company misidentified the nature of the abnormal activity as relating to possible espionage rather than an election influence campaign, and thus missed an important early signal of the operation.[202]

Targeted Facebook Advertisement identified as part of a Russian interference effort, paid for in Rubles and advertising a Russian-operated page sharing additional content.

Figure 1. Back the Badge Facebook Advertisement.[203]

Approximately one year after the election, Facebook executives were called to appear before the Senate Judiciary Committee regarding the role the platform unwittingly played in Russia's influence campaign. At this hearing, a company representative testified that internal analysis showed that Russian influence agents had reached 126 million unique users over a period of three years leading up to the 2016 election.[204] These figures included at least 3,517 advertisements purchased by the IRA as highly targeted sponsored content (e.g., paid posts seen only by a narrow audience fitting demographics specified by the advertiser). Much more of the volume came from the creation of interest-based groups and false American identities producing and sharing such free content as pop culture-based

[203] Source: Permanent Select Committee on Intelligence, "Social Media Advertisements, 2016, Quarter 4, 2016-10: P(1)0005278," U.S. House of Representatives, accessed December 6, 2020, https://intelligence.house.gov/social-media-content/social-media-advertisements.htm.

[204] S., *Committee on the Judiciary*.

memes, however.[205] The campaign also exploited the company's subsidiary photo- and video-sharing site Instagram, which hosted at least 170 Russian interference-linked accounts and duplicated a number of the insidious ads purchased on Facebook.[206] Russia's disinformation was then amplified on both sites by unsuspecting Americans sharing and reposting the tainted content to even wider audiences.[207] See Figures 2 and 3. Content known or suspected to have come from coordinated Russian activity covered a wide range of election-adjacent topics, including but not limited to the following:

- promotion or attack of political policies
- commentary on social issues
- inflammatory religious imagery
- election logistics disinformation, such as false advertisements with phone numbers encouraging readers to text their votes rather than waiting in line at a polling location.[208]

[205] A meme is a popular image or video, often humorous in nature, shared widely by Internet users. [207] Isaac and Wakabayashi.

[208] On a document for Congress showing a series of English and Spanish tweets encouraging Clinton supporters to vote via text or Twitter hashtag and/or falsely claiming that each voter would need to bring a birth certificate, "IL driving license record", naturalization certificate, social security card, government ID card AND a U.S. or foreign passport to vote, Twitter appended a disclaimer that they had not definitively attributed Russian origin to those particular ads, but attributed them to automated accounts. The House Intelligence Committee Minority subsequently released the document showing these tweets along with a comprehensive list or IRA Twitter account names and RT network's paid Twitter advertisements in a release titled: "Exposing Russia's Effort to Sow Discord Online: The Internet Research Agency and Advertisements," U.S. House of Representatives, Permanent Select Committee on Intelligence, accessed September 30, 2020, https://intelligence.house.gov/social-media-content/default.aspx; Penzenstadler, Heath, and Guynn, "Every One of the 3,517 Facebook Ads"; AnneClaire Stapleton, "No, You Can't Vote by Text Message," CNN, November 7, 2016, https://www.cnn.com/2016/11/07/politics/vote-by-text-message-fake-news/index.html.

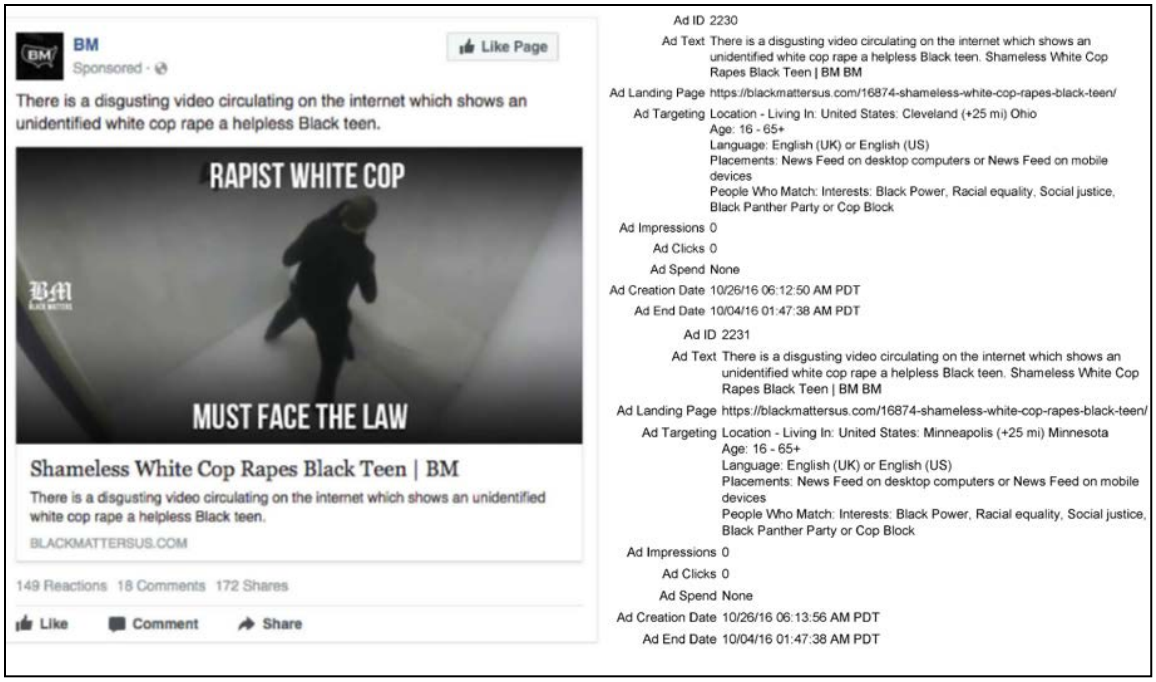
Page 3143 of 3957

Targeted Russian Facebook advertisement, paid in rubles, attempting to capitalize on social and political issues by promoting its "Stop All Invaders/Stop A.I." page in May 2016.

Figure 2. Stop A.I. (AKA Stop All Invaders) Facebook Advertisement.[209]

[209] Source: Permanent Select Committee on Intelligence, "Social Media Advertisements, 2016, Quarter 2, 2016-05: P(1)0000410," U.S. House of Representatives, accessed December 6, 2020, https://intelligence.house.gov/social-media-content/social-media-advertisements.htm.

Page 3144 of 3957



Russian Facebook advertisements using incendiary racial and social content to drive traffic to a fake Black social justice website operated by the IRA and narrowly targeted to Facebook users within 25 miles of Cleveland and Minneapolis, in the final weeks before the 2016 U.S. election. A Senate Intelligence Committee report found that "no single group of Americans was targeted by IRA information operatives more than African-Americans" and that two-thirds of IRA Facebook advertisements included words related to race; the report also illuminated efforts to dissuade African-Americans from voting in 2016, or to support Green Party candidate Jill Stein.

Figure 3. BM (AKA Black Matters) Facebook Advertisement.[210]

Exact figures on Kremlin-produced content are unattainable for a variety of reasons. Deleted or suspended accounts cannot always be recovered for review, definitively identifying the origin of every single well-produced fake profile is likely impossible, and distinguishing impersonators and amplifier accounts from authentic users is challenging. Nevertheless, a sense of the scope and breadth of Russia's operation can be gleaned from a review of statistics put forth by social media companies and investigative reports following the 2016 election.[211] At the same Senate Judiciary Committee hearing where

[210] Source: Permanent Select Committee on Intelligence, "Social Media Advertisements, 2016, Quarter 4, 2016-10: P(1)0004496," U.S. House of Representatives, accessed December 6, 2020, https://intelligence.house.gov/social-media-content/social-media-advertisements.htm.

[211] Renee DiResta et al., *The Tactics & Tropes of the Internet Research Agency* (Austin, TX: New Knowledge, 2018); Penzenstadler, Heath, and Guynn, "Every One of the 3,517 Facebook Ads"; S., *Committee on the Judiciary*.

Facebook disclosed its initial findings, Google admitted its streaming platform YouTube had been host to more than 43 hours of content across over 1,100 videos produced by suspected Russian interference agents. Google also shared that its AdSense online advertisement service had accepted more than $4,700 from the IRA to advertise on web pages and in search results.[212] In its turn at the same hearing, Twitter divulged the discovery of more than 2,700 IRA-affiliated accounts that had produced 130,000 tweets.[213]

Each of these platforms substantially raised the totals in subsequent reporting on Russian interference in the ensuing months and years as investigations continued. In October 2018, Twitter released more than nine million messages generated by 3,841 IRA-linked accounts.[214] Facebook later announced that it had deleted roughly 583 million fraudulent accounts and 837 million spam posts in the first quarter of 2018 alone, and that it believed that an additional four percent of its more than two billion active users were likely fake accounts that had gone undetected.[215] Though Russian interference was not likely responsible for every one of these fraudulent accounts, the sheer volume highlights the high degree of vulnerability of social platforms to misuse and illustrates the tremendous difficulty of detection and removal on so grand a scale.[216] Concurrently with Facebook and Twitter's announcements, such additional platforms as blog-hosting site Tumblr were found to have been exploited as well. After first reporting the suspension of 84 accounts that the company says "engaged in state-sponsored disinformation and propaganda campaigns" in March 2018 following months of media pressure, Tumblr added an additional 113 names to this list by mid-November.[217]

3. Microtargeting

One of the reasons Russia's 2016 social media influence campaign escaped mainstream scrutiny for as long as it did likely owed to its ability to tailor specific messages to different groups.[218] By partitioning the content, Russian actors ensured that only those likely to accept or appreciate a given message would even see it; indeed, the Senate Judiciary hearings into Russian social media influence campaigns indicated that much of the content was tailored and distributed to specific audiences.[219] While the trolls may have simply exploited publicly visible biographical and interest-based information on users' social media profile pages and user-generated content, they also may have capitalized on the availability of public records data in U.S. jurisdictions and thus extrapolated this data by using political or societal stereotypes.[220]

Worryingly, speculation abounded in the months after the 2016 election that Russia's targeted influence efforts may have also relied on criminally obtained information. One popular early theory was that Russian hackers might have stolen voter data by hacking the Democratic or Republican National Committee or even election commission offices.[221] Another incendiary accusation was that the Trump campaign might have provided information about voter rolls to the Russian operatives.[222] Though neither story was proven, the implication is terrifying; immense troves of data concerning potential voters exist in nearly all developed Western democracies. Much of this data is maintained

Page 3147 of 3957

by private entities outside the federal government's purview to protect or regulate.[223] Moreover, nearly all this data can be obtained through a variety of means, to include legitimate purchases, theft, espionage, or collusion with a compromised actor.

4. Hacking and Cyberattacks

One of the most widely known and consequential examples of Russia's use of cyberattacks to influence an election is the hacking, attributed to the GRU, of the Democratic National Committee (DNC) and Hillary Clinton campaign team members' emails around 2016. According to a July 2018 indictment filed by Special Counsel Robert Mueller against 12 GRU officers, the intelligence agency used a variety of techniques including spearfishing through spoofed Google security notification messages and Microsoft files.[224] Once inside the DNC's networks, they monitored staff activity, implanted malware, and stole additional documents. The intrusion was not wholly unnoticed, but it was not stopped. The FBI had alerted the DNC of suspicious Russian-based activity on their servers on multiple occasions beginning in September 2015, though miscommunications and insufficient technical scans within the DNC failed to act properly on these tips.[225]

In June 2016, the hackers used anonymous online personas called DCLeaks and Guccifer 2.0 to "leak" selectively and promote links to thousands of the emails and other documents to the public without revealing obvious Kremlin fingerprints. The hackers also appeared to partner with WikiLeaks, a renowned international trafficker of stolen

Page 3148 of 3957

information and government secrets.[226] U.S. media outlets reported extensively on the contents of the emails each time a new batch was released, to damaging effect; a *Columbia Journalism Review* study conducted after the election argued that *The New York Times*' extreme focus on the hack and leak played an outsized role in costing Clinton the presidency.[227] Among other controversial issues, information in the emails revealed DNC chairwoman Debbie Wasserman Schultz's apparent bias toward Clinton and disdain for her primary opponent Bernie Sanders.[228] This disclosure led to Wasserman Schultz's immediate resignation on the eve of the Democratic National Convention, as well as high tension between Sanders and Clinton supporters that overshadowed Clinton's nomination ceremony and potentially cost her some of the Sanders supporters' votes in the general election.[229]

Somewhat surprisingly, Moscow's scheme with the stolen emails was not entirely met with bipartisan condemnation, and may have even received some measure of tacit encouragement. In July 2016, Trump generated a scandal by publicly asking Russia to "find the 30,000 emails that are missing" from Clinton's server during a televised campaign speech, saying Moscow's hackers would "probably be rewarded mightily by our press" for doing so.[230] Occurring soon after public reports that intelligence officials believed Russia was behind the DNC server hack emerged, Trump's request was criticized by some as a literal entreaty to an adversarial foreign state to intervene on his behalf in the election via

illegal activity.[231] In 2017, reports emerged that Trump's son Donald Jr. and son-in-law Jared Kushner, along with Trump campaign manager Paul Manafort, had met with a Kremlin-linked Russian attorney offering damaging information about the Clintons the same week that documents stolen from the email hack were released.[232] To Trump's rage and dismay, his opponents seized on this meeting, along with inconsistent explanations of it from Trump and his legal advisors, to accuse his campaign of collusion with Russia in the hacking and influence campaign or at least inappropriate behavior in the face of improper offers of assistance from a top U.S. foe.[233]

Moscow's hacking efforts targeted not just communications and documents from political campaigns, but also attacked U.S. election infrastructure; a chilling escalation that has the potential to cause longer-term damage to democratic societies than the defeat of a single candidate. Two months before the 2016 election, U.S. voters were alarmed by reports that the Department of Homeland Security (DHS) had detected hacking attempts on the election systems of 21 states, with Russia as the likely culprit.[234] A month before that disclosure, the Illinois Board of Elections had already confirmed that its database of registered voters had been breached in what the FBI considered a sophisticated foreign

[233] Further fanning the flames of collusion accusations was the revelation that major Trump campaign supporter Roger Stone had been in contact with WikiLeaks and seemed familiar with the contents of stolen emails before their release. Stone was later convicted on seven felony counts related to his obstruction of a Congressional inquiry into Russia's attempts to influence the election in favor of Trump, including lying under oath and attempting to block the testimony of other witnesses. Even if no actual coordination occurred between the Trump campaign and Russia with regard to stolen and leaked emails, these incidents at the very least illustrate how the DNC and the Clinton campaign hacking operation managed to cause problems for both candidates at different times, and contribute more generally to exacerbating mistrust and division among American voters. attack.[235] In July 2018, the office of Special Counsel Mueller took action on these claims and announced an indictment charging that two GRU operatives probed websites and networks of counties in Georgia, Florida, and Iowa for back-end server vulnerabilities one week before the 2016 election.[236] In 2019, reports from the Senate Intelligence Committee, DHS, and FBI eventually acknowledged that Russia had actually attacked the election infrastructure of all 50 U.S. states in 2016, with a possible intent to use the fruits of these attacks at a later time.[237]

C. OTHER MODERN RUSSIAN EFFORTS TO INFLUENCE FOREIGN ELECTIONS

Such a multi-faceted and sophisticated blitz (e.g., support for preferred candidates, slander against opponents, media manipulation, internet trolls, cyberattacks, and other interference tactics) has troubled democratic elections across the world. In fact, the United States could have looked toward NATO partner Bulgaria's elections in 2015 and 2016 as a warning of the potential danger to come in its own election cycle. On the day of its local elections and referendum on future electronic voting in 2015, the networks of Bulgaria's Central Elections Commission and various government ministries were besieged by a DDoS attack.[238] Such assaults are commonly used to overwhelm sites and servers with automated connection requests to the point of a catastrophic crash. The Central Election Commission announced that it was confident that the integrity of the results remained intact despite the attack, but subsequent U.S. government and private sector analysis of the attack

Page 3151 of 3957

accusing GRU as the culprit raised alarms about the extent of Russian influence campaigns.[239]

Ahead of the country's 2016 presidential election, multiple Bulgarian government officials reported that its national security service had intercepted an election strategy dossier produced by a Kremlin-linked Russian think tank and prepared for Bulgaria's Socialist Party.[240] Delivered by a Russian official sanctioned by the United States for spying, the document proposed the distribution of false polling data favoring the party's candidate and anti-NATO position to help the party win.[241] Polls predicting the Socialist Party candidate's victory and alleging that a majority of Bulgarians trusted Russia more than NATO had indeed mysteriously surfaced during the election campaign season.[242] The poll had been conducted by a mysterious Bulgarian company called Gallup International, which bore no relation to and was the target of a name-infringement lawsuit from renowned U.S.-based polling company Gallup Incorporated.[243] Per former Bulgarian ambassador to Russia, Ilian Vassilev, regarding the anti-NATO Gallup International report:

> This wrapped-in-secrecy poll had no details on methodology nor funding sources. Russian media strategists and their Bulgarian proxies used the Western name to fool people about its credibility and spread their message.[244]

Along with this assessment, Vassilev published a warning about Russia's use of RT, Sputnik, and various proxies to sway the Bulgarian vote and ultimately drive the nation out

Page 3152 of 3957

of NATO.[245] In the end, the Socialist Party's preferred candidate, Rumen Radev, won the election and became president.[246]

The attack on Bulgaria's elections system was not unprecedented, as Russia had allegedly attempted the same in Ukraine one year prior during its 2014 presidential and parliamentary elections. Days before the election, self-proclaimed Russian "hacktivists" hacked the Central Election Commission's website in an effort to publish false information declaring a well-known far-right extremist as the election winner.[247] Not long after this came to light, the head of Ukraine's SBU security service announced two days before the election that a virus meant to destroy election results had been detected and removed from its Central Election Center services.[248]

At the same time Bulgaria and the United States endured Russian election interference campaigns, yet another NATO country found itself in the Kremlin's crosshairs. French National Rally candidate Marine Le Pen's 2016–2017 presidential campaign benefited from $13 million in loans from a Moscow bank, likely approved and quite possibly directed by the Kremlin.[249] This substantial funding was seen as vital to keeping the once-fringe candidate's campaign afloat, and helped her achieve a shocking second-place finish. During a highly publicized meeting between Le Pen and Putin ahead of the election, the Russian leader appeared to be trying hard not to smile as he ominously stated that "of course" Russia did not want to meddle in the French election.[250] Such outside support has been critical to National Rally's survival as French and other Western banks

had refused to finance a party seen by many as racist and xenophobic.[251] A BBC report citing hacked emails and conversations with multiple Le Pen associates heavily suggested prior clandestine meetings between Le Pen and Putin and detailed her intended role in legitimizing Russia's Crimea annexation.[252] It should be noted that financial support offered by Russia is often obscured through intermediaries for plausible deniability, and that support need not be explicitly monetary.[253] Hungary's Political Capital Policy Research and Consulting Institute opined in 2014 that in exchange for fealty to the Kremlin, parties are given "valuable professional, organizational and media assistance, i.e., access to networks and political know-how."[254]

During France's 2017 presidential election, Russia's state-run Sputnik news agency published false reports that François Fillon had overtaken Emmanuel Macron as Le Pen's strongest challenger.[255] At minimum, the ploy seemed geared to ensure that her opponent in a potential runoff round would be Filion—another Russia-friendly, NATO-criticizing candidate—rather than Kremlin skeptic Macron.[256] Russian foreign media relentlessly attacked and smeared Macron throughout France's election season with a wide variety of topics and tactics.[257] Sputnik and other Russian media outlets published baseless

accusations that Macron was homosexual, mentally ill, and financially supported by a mysterious and powerful "gay lobby."[258]

The Kremlin also repeated the hack-and-leak stunt it used against the Clinton campaign during its interference in France's presidential election, albeit with diminished success. Two days before the 2017 presidential election runoff between Le Pen and Macron, nine gigabytes of data stolen from the Macron campaign including 21,075 emails were posted to the internet and promoted on social media by a large network of automated accounts, as well as WikiLeaks.[259] Disturbingly, the stolen Macron emails were purportedly mixed with falsified documents attempting to frame him for fraud; a trick that seems difficult for readers to discern or investigators to prove, given the illicit nature of the genuine documents' theft and release.[260] Bolstering the theory that Russia had altered the emails, a report from the University of Toronto released that same month revealed similar tactics used by the GRU against journalist and Putin critic David Satter, whose stolen emails were deliberately modified in an effort to smear Putin critic Aleksei Navalny.[261] Such tactics represent a perhaps overlooked element of danger to hacked and stolen documents; they can be used as cover to add legitimacy to forgeries that thus put a digital twist on an age-old KGB dezinformatsiya trick.

Possibly due to its mistimed release within the mandatory media blackout period of French eve-of-voting "election silence" laws, or perhaps because voters had already made

up their minds or were wary of email leaks after the recent Clinton hacking debacle, the episode seemingly had no major effect on the election result.[262] Though Russia denied responsibility, an analysis conducted by cybersecurity company Flashpoint attributed the attack to the GRU.[263] This finding supported an earlier Trend Micro report warning of Russian phishing attempts against Macron and his campaign.[264] On October 19, 2020, the U.S. Justice Department unsealed indictments against six GRU officers for their roles in "spearphishing" hacks against Macron and his party, along with other cyberattacks including NotPetya, the Ukraine cyber grid disruption, and a 2018 Winter Olympic Games cyberintrusion.[265]

These European countries' recent experiences with Russian election interference contain many of the same elements the United States was subjected to in 2014: disinformation, media manipulation, leak of stolen documents, forgeries, support for fringe candidates, and even attacks on election infrastructure. The diversity, frequency, and broad range of Kremlin efforts to intervene in its rivals' electoral affairs, along with the obvious harm manipulating the outcome of a country's democratic process can cause in the short and long term, illustrate that election interference may be the most potent and dangerous of Russia's covert influence tactics.

IV. FALLOUT AND VULNERABILITIES

This chapter explores a range of vulnerabilities and possible consequences faced by the U.S. should such attacks on elections succeed. To do so, this chapter explores several examples of fallout from Russia's efforts against the 2016 U.S. presidential election.

Though the Special Counsel finding and myriad intelligence reports definitively point to deliberate Russian interference in the 2016 U.S. election in support of a Trump victory, assessing the operation's effect on the outcome is necessarily an inexact science. While it is impossible to know, for example, how many voters would have chosen Clinton rather than Trump, Stein, or another option had it not been for encounters with Russian disinformation or the leaked email controversy specifically, it is not difficult to trace clear examples of damage to the Kremlin plot.

One obvious consequence of Russian interference in the 2016 U.S. election was reputational harm for candidates and their surrogates. For one, the email leaks had a demonstrable effect on the DNC when Wasserman Schultz resigned as chairwoman due to the content of her exposed conversations.[266] Media coverage and public perception in light of the strategically damaging leaks was undeniably negative for Clinton as she sought to win over undecided and reluctant voters. Trump, his family, and his campaign team all clearly viewed coverage of the Trump Tower meeting and other allegations of the campaign's ties to Russia as unpalatable, given their efforts to deny accusations and shut down the Special Counsel investigation. Jill Stein, too, bristled at accusations that her campaign had been supported by Russia once the investigations of interference triggered additional scrutiny of her warm relationship with RT.[267] It is clear, however, that reputational harm from the fallout of Moscow's meddling extended far beyond that of

political candidates and their campaign associates, likely to an extent that surprised even the leaders of the malign influence operations.

Another example of how the ever-present possibility of Moscow meddling can lead to confusion and controversy occurred in October 2019, when a quote by Hillary Clinton warning that Russia was likely "grooming" a third-party disrupter like Stein to help defeat the 2020 Democratic candidate made waves in the media.[268] Many U.S. news outlets reported that Clinton had accused 2020 Democratic presidential candidate Tulsi Gabbard of being a Russian asset, which then prompted a public feud between the two that led other 2020 Democratic candidates to take sides amid a small rift within the party.[269] Such organizations as the Alliance for Securing Democracy reported that Gabbard received outsized coverage on RT and that "bot-like activity" periodically boosts her profile on social media.[270] This finding raised several alarming possibilities, including that Russia could have either been boosting Gabbard as Clinton insinuated, or that it could be framing her as a distraction or a form of campaign-sinking slander. Even if the accusation could be proved false, this incident could nevertheless illustrate how the specter of Russian interference can be weaponized against a candidate and contribute to division without Russia even having to take action. This incident—and its knock-on effects—were only possible because of successful Russian influence operations and the effect it had on U.S. voters' perceptions.

Notably, Gabbard, Stein, and Trump have all publicly labeled criticism of their seemingly pro-Russia policies and associations as "McCarthyist."[271] McCarthyism describes a period of time in which the U.S. government subjected thousands of its own citizens to loyalty tests, harsh investigations, and accusations of treason in service of the Soviet Union.[272] Though Soviet espionage undeniably posed a threat at the time, this period is generally regarded negatively due to government overreach, baseless political persecutions, and exaggerated fears of communist influence.[273] Today, RT journalists repeatedly publish articles decrying "McCarthyism's return" in an effort to protest mounting restrictions against their operation in Western countries.[274] Such disingenuous protests are reminiscent of Kim Philby, the notorious London *Times* journalist and Soviet double agent within British intelligence services who provided Moscow with top-secret communications between U.S. and British operatives in the CIA and MI6. Philby claimed to be an innocent victim of McCarthyist slander when his cover began to be blown, and used the success of his disingenuous protest to prolong his espionage for a time.[275] Though erroneously exonerated of the accusations, Philby did resign from his position at MI6 amid ongoing speculation; though he continued work as a journalist, his value to the Kremlin

[275] Andrew and Mitrokhin, *The Sword and the Shield*, 160.

was greatly diminished. Eventually outed by a Soviet defector, Philby ultimately defected himself, but received a cooler-than-anticipated reception in the Soviet Union.[276]

Ultimately, the 2016 U.S. election influence campaign paid more dividends than even Russia likely expected. One likely unplanned windfall of the DNC and Clinton campaign hacking operation for Moscow is that the U.S. response to the attack managed to entangle the FBI, long a target of Soviet *dezinformatsiya* smear campaigns, in extreme controversy that tarnished its reputation among a significant portion of the U.S. population. The Clinton email leaks added fuel to an ongoing, unrelated scandal regarding her improper use of a private email server for official business during her tenure as Secretary of State, as it hinted the possibility of security breaches with classified information.[277] This development put FBI director James Comey in a bind as he struggled to decide what the bureau should and should not disclose to the public about both the private server investigation and the DNC hack investigation, because he feared any disclosures could imply or reveal improper conduct by a presidential candidate and thus potentially impact voters' choices.[278] Comey's decisions on these matters led many Democrats to accuse him

[278] Washington Post Staff.

of demonstrating undue bias against Clinton and deliberately swinging the election for Trump.[279]

Notably, Comey's decisions were said to have been influenced by another facet of Russian interference and disinformation: the FBI's discovery of a suspicious Russian intelligence document alleging that Attorney General Loretta Lynch had pre-emptively reassured Clinton's team that the server investigation would tread softly.[280] This document involved purported but possibly fabricated emails involving Lynch and Wasserman Schultz.[281] Though the bureau's own analysis concluded that the report was unreliable and possibly deliberately manufactured to fluster U.S. intelligence agencies, its existence helped persuade Comey that a public explanation was needed as a defensive measure against future accusations of corruption.[282]

Unfortunately, for the FBI, Trump, along with many of his supporters, came to view Comey as biased against *him* due to the bureau's further investigation into Russian interference after the election, as it implied that Trump's narrow victory might have been

assisted by a top rival state.[283] Trump also complained throughout his presidency that Comey and a cabal of "deep state" actors within the DOJ and FBI had engaged in illegal spying activity against his campaign to prevent or end his presidency.[284] Post-election polling indicates that the bureau experienced a loss of trust from both Congress and a significant portion of the U.S. population immediately following these episodes.[285] A 2018 poll conducted by Penn State University found that since this episode, voters who lean Republican or independent trusted the FBI less than half the time, and that less than half of Americans believed that "most FBI agents enforce the law fairly."[286]

Other U.S. government intelligence agencies suffered from the fallout from Russia's election interference as well. The DNI released a declassified joint CIA, National Security Agency (NSA), and FBI report two months after the 2016 election, which unequivocally accused the Kremlin of meddling in the election to Trump's benefit:

> Russian President Vladimir Putin ordered an influence campaign in 2016 aimed at the U.S. presidential election. Russia's goals were to undermine public faith in the US democratic process, denigrate Secretary Clinton, and harm her electability and potential presidency. We further assess Putin and the Russian Government developed a clear preference for President-elect Trump… Putin and the Russian Government aspired to help President-elect Trump's election chances when possible by discrediting Secretary Clinton and publicly contrasting her unfavorably to him…Moscow's influence campaign followed a Russian messaging strategy that blends covert intelligence operations—such as cyber activity—with overt efforts by

> Russian Government agencies, state-funded media, third party intermediaries, and paid social media users or "trolls."[287]

Upset that it undermined the degree or legitimacy of his victory, Trump forcefully rejected the report's finding even before it was published.[288] In December 2016, he issued a derisive rebuttal to the CIA's reported findings that starkly undermined his own intelligence agency's credibility, "These are the same people that said Saddam Hussein had weapons of mass destruction."[289]

Siding with a principal U.S. adversary over his own intelligence community, Trump repeatedly insisted that he believed Putin's denials about responsibility for the hack.[290] On multiple occasions, Trump also suggested that the operation could have been the work of China, other countries, a morbidly obese domestic hacker, or even the DNC itself as a distraction from Clinton's private server scandal.[291] The public spat touched off lasting friction between Trump and the intelligence agencies, particularly once Trump expressed public disdain for the Special Counsel investigation and sought a one-on-one meeting with Putin without alerting or consulting the DNI.[292]

The outgoing administration struggled to respond appropriately to the Clinton email release operation as it unfolded. President Obama initially chose to tread lightly and sought

to avoid appearing to aid Clinton's chances of victory.[293] Later deciding to alert the public of Russia's hand in election manipulation, Obama found himself thwarted by Mitch McConnell, the Republican Senate Majority Leader.[294] McConnell espoused skepticism of the available intelligence and refused to cooperate in a joint warning about election interference.[295] DHS Secretary Jeh Johnson's offer to provide state election officials with federal cybersecurity assistance was similarly thwarted by incidents such as Georgia Secretary of State Brian Kemp accusing the Obama administration of "a politically calculated move" and refusing to cooperate lest the Democratic administration seek to use the situation to aid its party's candidates in some way.[296]

The Obama administration's eventual punitive response—the expulsion of 35 Russian diplomats and the closure of two Russian embassy compounds—resulted in further collateral damage to the credibility of certain U.S. government officials when curiosity regarding Russia's uncharacteristic restraint from retaliation later ensnared two members of Trump's cabinet in scandals.[297] Mike Flynn, Trump's National Security Advisor, was found to have engaged in, and lied to the FBI and administration officials about, undisclosed conversations with Russia's ambassador to the United States before Trump took office, along with other omissions such as failing to report a $45,000 payment for his speech at the RT gala referenced earlier.[298] These findings led to Flynn's swift departure from Trump's cabinet, which sparked investigations surrounding his alleged service as an

undisclosed foreign agent and potential violations of the U.S. Constitution's Foreign Emoluments Clause, and eventually drew indictments and a guilty plea from Flynn.[299]

Attorney General Jeff Sessions was also embroiled in controversy over his own initially undisclosed contacts with the Russian ambassador prior to Trump's inauguration, when Sessions was a U.S. senator.[300] Amid calls for his resignation from Senate Democrats who felt he had misled them by failing to inform them of these contacts, Sessions swiftly recused himself from any DOJ investigations regarding Russian election interference.[301] Sessions' recusal led to the appointment of a Special Counsel investigation led by former FBI Director Robert Mueller, which infuriated Trump and ultimately led to Sessions's forced departure.[302]

Furious at accusations that his campaign had colluded with Russia, Trump sought to discredit the Special Counsel investigation throughout its duration by decrying it as a witch hunt and accusing Mueller and his team of being "angry Democrats" and "Trump haters" with a partisan agenda to sabotage him.[303] The investigation ultimately led to, among other things, 14 referrals of criminal matters to the DOJ, 37 indictments, and a report finding "numerous links between the Russian government and the Trump campaign"

along with evidence of "sweeping and systemic" Kremlin election interference.[304] William Barr, Sessions' eventual successor as Attorney General, generated controversy and questions of credibility by issuing a summary letter of the Special Counsel report to the congressional Judiciary Committees in March 2019 that appeared to gloss over some of the report's findings.[305] This report was assailed by many legal analysts, journalists, and Special Counsel members, including Mueller himself, as an inadequate or even deliberately misleading portrayal of the investigation's findings. The ensuing controversy resulted in further accusations of DOJ partisan corruption, and led to more than 2,000 former DOJ employees publicly calling for Barr's resignation, as well as 27 members of the DC Bar requesting sanctions against him in a formal disciplinary complaint.[306] In aggregate, the nation's top law enforcement, justice administration, and intelligence bodies weathered a torrent of attacks on their credibility in the course of investigating Russian interference in the 2016 U.S. presidential election. Historically low faith in the DOJ, FBI, and intelligence community is an indisputable boon for future Russian election interference attempts.

As with the AIDS and Kennedy assassination *dezinformatsiya* episodes, Russia could not have predicted or controlled the aftermath and consequences of their initial cyberattack against the DNC and social media trolling campaign, but can only be delighted by the outsized and lingering results. As it stands, the fallout of a hacking and

Page 3167 of 3957

disinformation operation perpetrated by the Russian government helped induce a staggering amount of damage to a variety of targets. These include but are not limited to the following:

- undermining Clinton's election campaign and damaging her prospects of victory
- sowing lasting discord within the DNC
- alienating and enraging potential left-leaning voters who had favored Sanders
- setting in motion multiple events resulting in distrust for the FBI and DOJ and the ruination of prominent officials' careers
- provoking lasting animosity between Trump and the U.S. intelligence community
- creating legal and political headaches along with embarrassing distractions for Trump, his children, and associates
- spurring the firing and criminal prosecution of the National Security Advisor
- leaving a large number of U.S. citizens believing their leader conspired with a major U.S. foe to take power

The degree of damage to the credibility of U.S. government leaders and institutions affected by Russia's 2016 interference campaign is varied and difficult to quantify, but it is undeniable that some harm was sustained; and worryingly, could occur again. Even where evidence of Kremlin interference is elusive, the specter of such attacks hangs over subsequent elections and stokes long-term damage in voters' faith that elections are secure and free of outside tampering.

To wit, a minor incident in the 2020 U.S. presidential election offered a warning that the specter of Russian interference remains, and is still capable of inflicting damage

Page 3168 of 3957

on the nation and its leaders. With early voting already underway, *The New York Post* controversially published a trove of emails allegedly sent to and from the son of Democratic candidate Joe Biden.[307] Many media outlets and analysts investigating the story identified significant questions about its veracity, including speculation that suspected and indicted Russian influence agents had provided the material to a U.S. intermediary.[308] Within days, reports emerged that an FBI investigation had been launched regarding whether the emails were hacked and doctored as part of a foreign disinformation campaign.[309] Soon after, the DNI, John Ratcliffe, publicly denied the ongoing investigation and declared the story "not part of some Russian disinformation campaign" and excoriated House Permanent Select Committee on Intelligence chairman Adam Schiff for publicly linking the story to a Russian disinformation plot.[310] Notably, Facebook and Twitter both took immediate steps to limit posts linking to the *Post* article due to its questionable veracity, its use of possibly stolen private personal information, and its status as possible election-related disinformation; decisions that Trump campaign officials immediately decried as undue election interference by the social media titans.[311] While this incident does not appear to have had a major impact on the election results, it illustrates the fact that either Russian interference or accusations thereof may be an ever-present facet of future elections and has the capacity to provoke questions of credibility for U.S. government officials tasked with securing elections and national interests.

V. CONCLUSION

Investigative findings by bodies including the bipartisan Senate Intelligence Committee demonstrate unequivocally that Russia's preferred influence operation outcomes in the 2016 U.S. presidential election came to pass, potentially along with "victories" in other elections.[312] Much argument and investigation has ensued over the degree to which Kremlin meddling influenced such outcomes, but its presence and potential is virtually undeniable. With nearly a century of experience in covert influence techniques and plenty of practice trying to interfere in Western elections, Russia has many skills and tools, such as disinformation and cyberattacks with which to continue meddling in the democratic affairs of its rivals. The persistence of such decades-old Soviet-made myths as the Pentagon AIDS connection and Kennedy assassination conspiracies point to a sobering truth regarding Russia's modern disinformation campaigns: it is impossible to forecast the long-term effect a given Kremlin fabrication may have, but history strongly suggests that at least a few may potentially cause damage even after discovery and attribution. Unfortunately, Russia appears all too willing to continue stressing the system with a variety of techniques and targets.

Covert Kremlin operations may be capable of corrupting a political candidate, framing one to make it appear that they had, or reaping the paranoia-inducing fruits of prior influence campaigns even when not directly intervening in an incident. Examinations of Soviet precedent and recent Kremlin tactics in democratic campaigns reveal that true or fabricated rumors of corruption and election fraud, exploitation, and exacerbation of domestic civil tensions, and even promotion of secession movements and rebellion, loom as possible threats. Challenges to the legitimacy of some future elections are plausible, whether because of successful Russian interference or even a good faith or disingenuous inaccurate accusation of such. These accusations could even be bolstered by a variety of

Page 3170 of 3957

well-honed Kremlin tradecraft, such as the production or dissemination of genuine, doctored, or fabricated material designed to lend credence to allegations.

It is therefore critically important for intelligence communities, investigative bodies, and other experts to evaluate the Kremlin's capacity for future operations, as well as their possible response to less favorable outcomes in future campaigns. Russia has the motivation, the capability, and a century of experience preparing it for future interference in U.S. affairs, and denying them the prize of election-related chaos and ruination of the U.S. government and electoral systems' credibility should be a top priority for national and homeland security entities.

ABSTRACT

AUTHOR: LTC Susan L. Gough

TITLE: The Evolution of Strategic Influence

FORMAT: Strategy Research Project

DATE: 7 April 2003 PAGES: 60 CLASSIFICATION: Unclassified

This paper will examine the evolution of how the U.S. Government and the Department of Defense have organized to conduct strategic influence as an instrument of national power, from the Psychological Warfare Division of World War II, through the Psychological Strategy Board and Operations Coordinating Board of the early Cold War, through the Vietnam years to today. Are they organized effectively today to meet the asymmetric threats of the 21st Century?

THE EVOLUTION OF STRATEGIC INFLUENCE

> It is the significant actions taken by government in and of themselves, the appropriate and most desirable arrangements of such actions, and the manner and emphasis of the publication of such actions to the world, that advance the struggle for men's minds and create a desirable climate of world opinion.
>
> —Robert Cutler

In the aftermath of the terrorist attacks on America in September 2001, both the American people and the U.S. Government tried to understand why some people could hate the United States so much that they would perpetrate such acts. Time and investigation into the motivations behind the terrorist acts have revealed that simply destroying terrorist organizations will not alter the conditions or mindsets that fostered such actions.

America has again entered a war of ideas, of hearts and minds - a war of ideologies as potent and potentially dangerous as the Cold War. Failure to succeed could have equally dire consequences as any envisioned in the struggle against the Soviet Union and Communism. Like the Cold War, this is a global war. Like the Cold War, the War on Terrorism needs to contain the wellsprings of Anti-Americanism to prevent further spreading, and then to erode and eventually eliminate those wellsprings. As before, this new war for the minds of men includes our friends, allies and neutral audiences, as well as hostile ones. Despite its lone superpower status, the United States will need the support of other nations to succeed on a long-term, global scale.

Since September 11, the Bush Administration has wrestled with how to organize and conduct a campaign to influence world audiences on a global scale – how to organize for strategic influence. In this paper, strategic influence is broadly defined as the deliberate, conscious coordination or integration of all government informational activities designed to influence opinions, attitudes, and behavior of foreign groups in ways that will promote U.S. national objectives, combined with other elements of national power to achieve maximum psychological effect.

Every act of government has a psychological impact. The movement of a carrier battle group from one end of the Mediterranean Sea to the other, for example, has a direct psychological impact on the countries in the area it departed and the countries near its new location. It may also indirectly influence other audiences around the world. The movement of the carrier becomes part of a strategic influence campaign when its movement was deliberately

directed and timed with White House and Department of Defense (DoD) press conferences, with State Department diplomatic endeavors, and with other government actions to magnify the psychological effect.

Strategic influence is nothing new; the United States has conducted strategic influence campaigns since its inception. The history of strategic influence in the United States has been a roller coaster, with ups and downs and occasional unexpected turns in new directions. And like a roller coaster, we always seem to end up back where we started. This oscillating approach has been a result of a peculiarly American outlook that using persuasion and influence at the national level is somehow unethical and inconsistent with a democracy, that using "psychological tricks" is "dirty" and immoral, and that it's completely unnecessary: there is no need to overtly persuade; the United States should just factually show the world who we are, and everyone will automatically recognize how wonderful we are and want to emulate us. The successful propaganda efforts of U.S. enemies also contributed to the American distaste in many circles for strategic influence. Anything that smacked of propaganda or psychological warfare became something that only the "bad guys" did: first the Nazis, then the Soviets. Fortunately, despite this attitude and resistance, most U.S. administrations in the latter half of the 20th Century recognized both the value and need for strategic influence.

Strategic influence and its elements have been known by many names: foreign information program, international information activities, political warfare, propaganda, psychological warfare, psychological operations, public information, public affairs, public diplomacy, international military information, information operations, influence operations, and perception management, to name just a few. Further, strategic influence has always had both overt and covert components.

Today, key informational components of strategic influence include public affairs, political warfare, political advocacy, public diplomacy and psychological operations. While each of the components contains a persuasive element to some degree, by themselves they do not constitute strategic influence. Public diplomacy by itself is not strategic influence. Psychological operations are not strategic influence. None of these components can be conducted in isolation in the 21st Century. Strategic influence constitutes the orchestrated combination of them all.

There is an accepted belief that history repeats itself, and that the mistakes of history will be repeated if we don't learn them. As the Bush Administration continues to prosecute the War on Terrorism, what can history teach us about organizing for strategic influence? How has the U.S. Government organized in the past to coordinate and conduct strategic influence? What

has been the DoD organization for and role in strategic influence? In a world where information, both true and false, is available worldwide, twenty-four hours a day, where events are broadcast worldwide virtually instantaneously, is the United States organized effectively to win the strategic influence battle of the War on Terrorism?

WORLD WAR II

The real crucible for the evolution of U.S. strategic influence was World War II. While there had been a successful foray into propaganda during World War I, that experience was fleeting. U.S. propaganda in World War I had no lasting impact on the people involved, the U.S. Government, or the War Department. World War II, however, laid the foundation for the future for strategic influence. While many people still had doubts about the efficacy of propaganda and psychological warfare, few had been unexposed to it. Propaganda was everywhere: on the home front, in local, national and international news, and across the battlefields. Names synonymous with early U.S. Government and DoD efforts in strategic influence had their seminal experiences in psychological warfare in World War II – Robert McClure, Robert Cutler, and Gordon Gray, to name just a few. And the impressions and experience of these and other World War II veterans directly affected the U.S. Government's approach to strategic influence through at least 1960.

At the outbreak of World War II, neither the U.S. Government nor the War Department had an organized capability to conduct psychological warfare. There were no committees trying to coordinate amongst the departments. No departments or agencies had offices or personnel dedicated to propaganda. The Army had no psychological operations units, and had not had a psychological warfare office on the staff since 1918.[1]

In early 1941, Colonel William B. Donovan conducted a fact-finding trip to the Middle East and Great Britain. Donovan was particularly impressed by Britain's system of coordinating and combining intelligence, counterintelligence, psychological warfare and unorthodox methods of sabotage, subversion and guerrilla warfare to achieve objectives. Upon his return, Donovan recommended that the U.S. establish a single agency to coordinate and control these same elements for the U.S. Government.

Donovan's recommendations, combined with the growing Nazi threat, apparently received support within the Roosevelt Administration. On 11 July 1941, President Franklin D. Roosevelt established the office of the Coordinator of Information (COI), with Donovan as its first director. COI had two divisions, Research & Analysis and the Foreign Information Service

Page 3212 of 3957

(FIS), plus sections for special intelligence and sabotage. FIS had the information piece, with a mission to explain U.S. policy everywhere except Latin America.[2]

Thus the initial seed for strategic influence was sowed. But conjoined to that seed from its inception was a disease that continues to plague strategic influence today: internecine and interagency rivalry, misperceptions, misinformation, and "turf" battles over control, frequently leading to deliberate roadblocks. Not everyone was happy with COI; too few people understood either psychological warfare or the infant "special operations."

Less than a year later, on 11 June 1942, Roosevelt dissolved the COI, replacing it with two new organizations: the Office of War Information (OWI), responsible for the psychological warfare function, and the Office of Strategic Services (OSS), responsible for special operations. Roosevelt created OWI due to a need to consolidate wartime information and psychological warfare activities in one agency and to better coordinate with the increasing number of agencies involved in propaganda. Roosevelt also desired to separate wartime propaganda from strategic intelligence and special operations. Over the next several months, additional presidential directives clarified the lines of responsibility between OWI and OSS. OWI had responsibility for domestic and overt psychological warfare, while OSS had the mission to conduct covert operations, including covert psychological warfare. Interestingly, the last such directive, in March 1943, directed that OWI coordinate its activities with the military services, but did not direct that OSS do the same.[3]

The War Department also began examining psychological warfare. In June 1941, John J. McCloy, the Assistant Secretary of War, formed a Special Study Group within G-2 to plan for future psychological warfare operations. This office eventually evolved into the Psychological Warfare Branch (PWB), G-2.[4]

Over the next year, a multitude of committees and groups were established to wrestle with psychological warfare issues: the Joint Chiefs of Staff (JCS) established a Joint Psychological Warfare Committee and a Joint Psychological Warfare Advisory Subcommittee; OSS established a Supporting Committee on Psychological Warfare; and Donovan chaired a Joint Psychological Warfare Advisory Committee that was chartered to coordinate psychological warfare activities with other government and civilian agencies outside JCS purview, including OWI and the State Department.[5]

This multitude of groups actually proved counterproductive at this stage of the development of strategic influence. In December 1942, the War Department disbanded the PWB. Too many agencies complained about the difficulty of defining psychological warfare and the various interpretations caused conflict within the Department. Interagency "turf" battles in

the new arena hampered any coordinated, constructive effort. JCS subsequently abolished all of its psychological warfare committees and gave OSS responsibility for military psychological activities. In response, the Army eliminated its PWB.[6] More than a year before the U.S. launched Operation Overlord, the top levels of the military bureaucracy had no psychological warfare offices, because they could not agree on a definition or who should be responsible for what activities.

However, the military was not bereft of psychological warfare assets. The same JCS document which disbanded the PWB and committees also gave the military theater commanders control of psychological warfare within their areas. This direction implicitly gave theater commanders the authority to determine their own relationship with OWI and OSS.[7]

Both the Pacific and European theaters conducted operational and tactical psychological warfare, controlled by organizations at the theater level. The theater commands created Psychological Warfare Branches or Divisions, depending on their needs. General Eisenhower activated the largest of these, the PWB at Allied Forces Headquarters (PWB/AFHQ), in North Africa in November 1942. By February 1944, PWB/AFHQ had expanded to become the Psychological Warfare Division, Supreme Headquarters, Allied Expeditionary Force.[8] At the tactical level, the Army established a number of Mobile Radio Broadcasting Companies, armed with print presses, loudspeakers, typewriters, radios, public address systems and leaflet bombs. These units operated much as military tactical psychological operations units do today, forming small teams that deploy forward to directly support the combat units.[9]

In November 1943, after much discussion and still with lukewarm endorsements, the Army reversed its earlier decision and established a Propaganda Branch in G-2 in November 1943. The new branch had responsibility to coordinate propaganda functions for the War Department, to staff OWI plans through JCS, and to provide an Army representative to the JCS liaison with OWI.[10]

Following World War II, despite advice to the contrary and the efforts of those involved, Army psychological warfare staffs and units virtually disappeared during the post-war drawdown. OWI and OSS also disbanded. By the outbreak of the Korean War five years later, the Army had only one operational psychological warfare troop unit.[11]

Two notable exceptions remained. In the occupied territories, the theater military Psychological Warfare Divisions became Information Control Divisions (ICD). The ICDs focused on “consolidation psychological operations” – gaining the cooperation of the civilian and military populace in the occupied area, creating favorable public opinions for Allied objectives for

the areas, and controlling all information sources as well as the dissemination of information within the occupied territories.[12]

At the War Department and Army headquarters, the Psychological Warfare Branch moved in late 1946 from the G-2 to the Policy Section, Plans and Operations Division. This marked the first recognition that psychological operations are operational in nature, and while intelligence supports psychological operations, psychological activities are not an intelligence function. However, centralization of psychological warfare still eluded the War Department. Responsibilities for different aspects of psychological warfare rested with several different agencies within the Department. Not until the Office of the Chief of Psychological Warfare was established in January 1951 did the War Department achieve centralization of effort.[13]

At the end of World War II, while writing about his experiences as Supreme Commander, Allied Expeditionary Forces, General Eisenhower noted:

> "In this war, which was total in every sense of the word, we have seen many great changes in military science. It seems to me that not the least of these was the development of psychological warfare as a specific and effective weapon…I am convinced that the expenditure of men and money in wielding the spoken and written word was an important contributing factor…Without doubt, psychological warfare has proved its right to a place of dignity in our military arsenal."[14]

When Eisenhower became President, psychological warfare became far more than just a piece of the military arsenal.

THE EARLY COLD WAR

The early Cold War years were a "Golden Age" for strategic influence. Veterans populated every department and agency of the U.S. Government – veterans, who, while they may not have been directly involved in psychological warfare, had seen the value and impact of such activities, and wanted to keep and utilize that capability in the future. Many people in government also correctly read the early evidence that the Soviet Union had also recognized the impact of propaganda during World War II, and was quickly building what would become a fearsome propaganda machine. The perspective of the country changed, too, in the aftermath of World War II and the beginning of the "Nuclear Age" – no longer could isolationism rule; the U.S. had to become the leader of the free world. Information and influence on the international scene grew in importance, as did the means to disseminate information.

The need for enhanced coordination of national security policy at the top levels of the U.S. Government arrived on the coattails of World War II. In June 1945, James Forrestal, Secretary of the Navy, asked Ferdinand Eberstadt, vice chairman of the War Productions

Board, to conduct a study on what form of postwar organization should be established to provide for national security. Forrestal requested recommendations not just for better organizing the War and Navy Departments, but also how to better integrate the military services with other government departments and agencies for national security matters.[15]

In his report to Forrestal, Eberstadt recognized that a new organization for the military services and their integration with other departments was just one piece of a larger problem that needed to be solved. He discussed the growing necessity to integrate and provide direction for all the departments and agencies within the U.S. Government towards a common goal and a unity of effort. Eberstadt also believed that stronger ties should be created among the military services, departments and agencies for strategy, logistics, planning, scientific research, mobilization, and "between the gathering of information and intelligence and its dissemination and use."[16]

To accomplish the necessary integration and direction, Eberstadt recommended the creation of a National Security Council to be the cornerstone of a new national security organization. Among its duties and functions as the formulator and coordinator for national security policy, Eberstadt recommended, "the Council should also control the policies and activities of the organizations responsible for the conduct of psychological and economic warfare."[17] Strategic influence, then, has been a part of the National Security Council since its inception.

TRUMAN

Two years later, on 26 July 1947, President Truman signed the National Security Act, to "provide for the establishment of integrated policies and procedures for the departments, agencies, and functions of the Government relating to national security."[18] The National Security Act enacted many of Eberstadt's recommendations, including both the creation of the National Security Council, to advise the President on the integration of domestic, foreign, and military policies relating to national security, and the creation of the Central Intelligence Agency (CIA).[19]

The National Security Council's first foray into a national information policy came in December 1947, with the signing of National Security Council Memorandum (NSC) 4/4A, "Coordination of Foreign Information Measures." The National Security Council hoped this directive would correct the lack of coordination in a weak U.S. propaganda campaign, to counter the well-coordinated and increasingly effective Soviet propaganda campaign. NSC 4 dealt with overt information policy. The memorandum designated the State Department as the primary

coordinator of U.S. information policy, and created the Interagency Foreign Information Organization (IFIO). NSC 4 also identified the CIA and the Army's Chief of Information, under the Deputy Chief of Staff, as key supporters of the national propaganda effort. NSC 4 included the Navy's Division of Public Information and the Air Force Troop Information and Education Division as potential players as well. The latter agency, and others similar to it, was included in information policy organizations throughout the Cold War because Cold War psychological warfare and counter-propaganda campaigns also included protecting and arming troops against hostile propaganda. NSC 4A, a classified annex, directed the CIA to initiate and conduct covert psychological operations to counteract Soviet propaganda.[20] Echoes of OWI and OSS can be clearly seen in this delineation of effort between overt and covert operations.

IFIO members included the Joint Chiefs of Staff (JCS), the Office of the Secretary of Defense (OSD), CIA and the National Security Resources Board.[21] The Assistant Secretary of State for Public Affairs headed the organization. IFIO did little until the Korean War. During that conflict, IFIO issued weekly directives that were to be used by member agencies as a basis for their propaganda activities overseas. IFIO's more lasting contribution came from its chairman, Edward Barrett, who first suggested the creation of a National Psychological Strategy Board in August 1950 to more effectively coordinate the national effort. For Barrett and the State Department, however, it was also a move to demilitarize the Government's psychological warfare activities.[22]

Congress also maintained a keen interest in national information and security policy. After a visit to Europe, where they had been inundated with hostile Soviet propaganda, Senator H. Alexander Smith and Representative Karl Mundt sponsored the Smith-Mundt Act. This Act, which passed with little difficulty on 16 January 1948, "breathed life into overseas information programs," and laid the groundwork for the future U.S. Information Agency (USIA). The Smith-Mundt Act provided funds "to spread America's message to the world" through a variety of media, including radio, print, film and exchange programs."[23] The Smith-Mundt Act also directed that any such information and programs "shall not be disseminated within the United States, its territories, or possessions."[24] Congressional and Department of Defense General Counsels have interpreted this statute to also apply to military psychological operations.

In response to the concerns and disagreements between DoD and the State Department over the implications of NSC 4/4A, President Truman signed NSC 10/2 on 18 June 1948. This directive created the Office of Special Projects, to carry out covert activities that had been assigned to the CIA, including covert psychological operations. The Office of Special Projects carried out plans as formulated by the Departments of State and Defense, but reported only to

Page 3217 of 3957

the CIA. This gave State and Defense some input into covert operations, but kept responsibility for it within the CIA. To maintain the secrecy and security of the covert operations, the name of the office changed shortly thereafter to the more ambiguous Office of Policy Coordination.[25] One of CIA's early ventures included the establishment and covert funding of U.S.-controlled overseas broadcasting stations, including Radio Free Europe and Radio Liberty.[26]

As the Cold War continued to build, some officials in the Truman Administration argued that the U.S. needed to do more than it was currently doing to influence the world situation. Based on recommendations from an ad hoc committee headed by Paul Nitze, Truman signed NSC 68 on 14 Apr 1950. NSC 68 called for an intense program of both overt and covert economic, political and psychological warfare to influence the political and psychological conditions in both the Free World and Soviet areas, with a particular aim to foster unrest in Soviet satellite countries."[27] NSC 68 was the hallmark of the American containment strategy of the Cold War.

While the Truman Administration prepared to fight both the Cold War and a potential World War III, North Korea attacked South Korea in the Fall of 1950 and precipitated a new type of war – "limited" war. The Soviet role in the origins of the Korean War galvanized the need for better coordination and planning of psychological warfare at the national level. The Soviets increasingly used propaganda and other unorthodox methods to increase their sphere of influence. The United States needed to find ways to counter Soviet influence that would not trigger nuclear war. Recognition arose that this was as much a battle of ideas, a battle for the hearts and minds of men, as it was a battle of tanks and artillery. Political and psychological warfare became key weapons in the U.S. arsenal.

At the Pentagon, the Army activated the Psychological Warfare Division (PWD), G-3, to handle Army's psychological warfare responsibilities in both Korea and the growing Cold War. Six months later, the PWD became the Office of the Chief of Psychological Warfare (OCPW). OCPW was not a section within the G-staff, but a special staff office with over 100 personnel and a direct access to the Chief of Staff. OCPW had responsibility for developing Army psychological and special operations plans, recommending policies for psychological warfare and special operations, and supervising the execution of Army programs in the field.[28]

Within the Korean theater, the military organized theater, operational and tactical level military psychological units much like the ones in World War II – with one key advancement. The 1st Radio Broadcasting and Leaflet Group (1st RB&L) was specifically designed to conduct strategic propaganda in direct support of military operations and to further long-term strategic aims. The 1st RB&L targeted not just enemy forces, but foreign populations in both friendly- and

Page 3218 of 3957

enemy-occupied areas.[29] It was the first military psychological operations troop unit to have a strategic psychological mission.

On 4 April 1951, President Truman created the Psychological Strategy Board (PSB) to develop, coordinate and evaluate the national psychological strategy effort, including the formulation and promulgation of national psychological objectives, policies and programs.[30] The PSB had three principal tasks: "(1) to provide more effective planning of psychological operations within the framework of approved national policies; (2) to coordinate the psychological operations of all departments and agencies of government; and (3) to evaluate the effectiveness of the national psychological effort."[31]

The creation of the PSB was the first time the U.S. Government attempted to organize a national psychological effort for influencing international audiences above the military theater/operational level. PSB members included the Under Secretary of State, the Deputy Secretary of Defense, and the Director of Central Intelligence; JCS provided a representative as the principal military adviser. PSB had a full-time Director, an Executive Secretariat, and a staff. The staff was organized into three offices, each under an Assistant Secretary: Plans and Policy, Coordination, and Review. The PSB also established panels, made up of representatives from each Office, and others agencies as needed. Panels were created as needed to handle one issue, and reported to the Offices and directly to the Board.[32] The PSB was not technically a part of the National Security Council structure. Rather, it was an independent organization, but was required to report to the NSC on its activities and its evaluation of national psychological efforts.[33] An important distinction - the PSB was intended as a coordinating organization and was not authorized to perform psychological operations.[34]

Truman's first PSB director was Gordon Gray, former Secretary of the Army.[35] Gray took a very broad view of PSB's responsibilities. None of the directives governing the PSB provided a specific definition for "psychological strategy" or "psychological operations". Gray interpreted PSB responsibilities as having cognizance over anything that had a psychological impact. Since virtually any act by a nation has such an impact, Gray eventually believed that PSB should have the lead on all foreign policy matters short of formal hostilities. A clash with State was inevitable. State firmly believed that PSB should be restricted to just coordinating information and propaganda, and not other aspects of foreign policy. Over time, other agencies and departments also became concerned that PSB was overstepping its boundaries and becoming almost a second National Security Council. This friction and broad interpretation of responsibilities eventually led to the PSB's downfall.[36]

Page 3219 of 3957

Gray's early priorities on taking charge, however, are still a model for today: development of a strategic plan, an estimate of the current situation, a statement of objectives, a plan for reaching national goals, and a clear delineation of responsibilities. Gray was also an early proponent of the need to improve understanding of the scientific aspects of psychological operations.[37]

Additional specific tasks and responsibilities for psychological operations were articulated in NSC 59/1, which covered overt propaganda efforts and established the Psychological Operations Coordinating Committee, and NSC 10/5, signed 21 October 1951, which expanded on NSC 10/2, reaffirming CIA responsibility for covert operations, including covert psychological operations, and calling for intensified covert action.[38] At this time, there were three key players in strategic influence: CIA, State and DoD. On 16 January 1952, State Department established the International Information Administration as its information arm that coordinated with PSB.[39]

In response to the establishment of the PSB and the additional psychological operations tasks specified in NSC Memorandums 10/2, 10/5 and 59/1, the Department of Defense (DoD) published DoD Directive C-5132.1 in April 1952, titled "Organization, Office of Psychological Policy." This directive established the Office of Psychological Policy, under the Assistant Secretary of Defense for International Security Affairs. The new office was headed by a Deputy for Psychological Policy, formally known in Defense parlance as the Deputy Assistant to the Assistant Secretary of Defense for International Affairs – Psychological Policy. DoD signaled the importance it gave this new office by specifying in the directive that the Deputy for Psychological Policy "shall have direct access to the DoD member of the PSB on matters pertaining to PSB and to the Assistant Secretary of Defense for International Security Affairs on other matters."[40]

The directive laid out DoD responsibilities, which included developing DoD positions on all PSB objectives, policies and programs; providing representation to the PSB and its panels, to the Consultant's Committee established by NSC 10/2, to any ad hoc committees established by NSC 10/5, and to the Psychological Operations Coordinating Committee established by NSC 59/1; and ensuring coordination with all DoD departments and agencies participating in any of these committees' activities.[41]

The role of DoD in peacetime psychological operations was not clear in DoD, let alone the other departments. The other departments tended to believe that, while DoD had a clear role in psychological warfare during hostilities, it didn't have much to do in peacetime. Some senior officials in DoD, though, felt that DoD capabilities could be utilized more effectively in

peacetime than the limited scope envisaged by other departments. DoD began to make a case for a larger role in psychological operations and planning its portion of the PSB's first status report, outlining the planning it had already done for wartime, when most of the U.S. propaganda machine would be subordinated to military goals. In the report, DoD also called for increased use of military assets for peacetime propaganda value.[43] In March 1952, the Army established the Psychological Warfare Center at Fort Bragg, North Carolina, to train both psychological operations and special operations personnel and units.[44] In late 1952, DoD further supplemented and expanded on its policy and roles regarding psychological operations with DoD Directive S-3140.1.

Two of the key purposes in DoD Dir S-3140.1 were establishing authority for using DoD capabilities to conduct psychological operations when not at war, and establishing a DoD Committee on Psychological Operations to more effectively coordinate and integrate DoD psychological operations efforts in the national psychological operations effort.[45] The directive also sought to increase senior official attention on psychological operations, and to enhance continuity, consistency, security and timeliness of psychological actions. To ensure that psychological operations received the necessary consideration at the top levels of the policy decision-making chain, DoD directed the Services Secretaries to assign functional responsibilities for psychological operations to Under Secretaries or Assistant Secretaries, and directed the Joint Chiefs of Staff to assign responsibility for military psychological matters to a general or flag officer. These officials, plus a representative from the DoD Office of Public Information, constituted the members of the new DoD Committee on Psychological Operations, headed by the Deputy for Psychological Policy. As with the earlier directive, DoD declared the significance of these new responsibilities by stipulating that the committee members "shall be specifically empowered to have necessary access to key personnel within their respective departments in all matters concerning psychological problems with which they are concerned."[46] The committee's purpose included securing the exploitation and integration of DoD potential in psychological operations and securing DoD viewpoints on psychological operations matters. The committee's initial task included developing and submitting an outline of the specific roles, objectives and capabilities of DoD to conduct psychological operations during the Cold War.[47]

EISENHOWER

The "Golden Age" for strategic influence continued under Eisenhower. Due to his wartime experience, Eisenhower came to the presidency with a clear idea on the uses and effectiveness of information and psychological warfare. He also had some very firm ideas about

the need for coordination at the highest level of government to win the battle against Communism. In a campaign speech in 1952, he spoke about the need to coordinate every significant act of government, to time and direct all the departments' actions, to produce the maximum effect.[48] In his second National Security Council directive, Eisenhower stated, "psychological operations are established instruments of national power."[49]

Early in 1953 Eisenhower established the President's Committee on International Information Activities (PCIIA), to examine in depth the nation's Cold War information policy. The committee was headed by William H. Jackson, a lawyer and former Deputy Director of the CIA, and included other notables in Eisenhower's Administration: Robert Cutler, Eisenhower's first National Security Adviser and a one-time member of the PSB; Gordon Gray, who would later become one of Eisenhower's National Security Advisers; John C. Hughes, one of Eisenhower's aides; and C.D. Jackson, a former member of the OWI who had worked with Eisenhower during World War II and Eisenhower's future PSB Director.[50]

The PCIIA report, published in June 1953, criticized the current state of information policy and the PSB in several areas. First, while the PSB had accomplished significant planning and provided guidance to the other agencies, it lacked the power and authority to effectively coordinate within an uncooperative interagency environment and to ensure implementation of its plans and policy guidance. Second, the PCIIA criticized the Truman Administration for conducting a defensive campaign against the Soviet regime, and urged Eisenhower to take the offensive in psychological warfare. And, third, they felt that the PSB had gone too far in developing an independently existing psychological strategy that was not integrated with overall national strategy. The name itself fostered a misconception that psychological strategy could be separated from every act the nation took.[51]

At this time, the National Security Council was an advisory board, not a coordinating agency. There were no interagency working groups, no policy coordinating committees as there are today. There was not even a National Security Adviser yet. PSB, at least while under Gray, had tried to fill that coordinating role, but without the proper authority, was unsuccessful.

Amongst PCIIA's recommendations, Eisenhower enacted three key ones that were to have a profound effect on national security policy-making and psychological warfare under his Administration: the creation of the Special Assistant to the President for National Security Affairs, the creation of the Operations Coordinating Board, with the subsequent abolition of the PSB, and the creation of the USIA.

Cutler, in a separate report to Eisenhower, first recommended that the President's Special Assistant for Cold War Planning become an adviser to the National Security Council,

Page 3222 of 3957

with the corresponding elimination of the PSB Director as an observer. Not long after, the Cold War Planning position became the President's Special Assistant for National Security Affairs, and Eisenhower chose Cutler as his first National Security Adviser.[52]

PCIIA strongly recommended replacing the PSB with the Operations Coordinating Board (OCB) to "coordinate and integrate psychological with national strategy and, more importantly, to act as the coordinating and integrating arm of the National Security Council for all aspects of the implementation of national security policy."[53] PCIIA clearly intended to fix some of PSB's problems, and signaled a change in the view of the National Security Council from advisory to coordinating. This was also the birth of the modern National Security Council interagency committee system.

Eisenhower established the OCB by Executive Order 10483 on 2 September 1953. Like the PSB, OCB was not originally within the NSC structure, but a separate agency that reported to it. The order also designated the Under Secretary of State as OCB chair. According to Cutler, the OCB would coordinate and "ride herd on" the performance and policies of all departments and agencies responsible for carrying out national security policy, and would be "constantly mindful" of the psychological implications of their actions.[54]

In January 1954, Eisenhower signed a National Security Council Memorandum that delineated the responsibilities for the departments and agencies participating in foreign information programs and psychological operations under his new National Security Council system. OCB responsibilities, with respect to psychological operations, included initiating new proposals for action, advising agencies on their operational planning responsibilities, coordinating the interdepartmental aspects of those plans, and orchestrating the timely execution of psychological operations to ensure their full contribution to the attainment of national security objectives.[55]

The third key recommendation of the PCIIA was the creation of the USIA. Truman had created the International Communications Agency to manage the activities under the Smith-Mundt Act.[56] Based upon the PCIIA report, Eisenhower created the USIA to perform the same work, but now as an autonomous agency reporting directly to the National Security Council. The USIA Director regularly attended National Security Council meetings as an observer.[57]

Eisenhower's directive gave USIA responsibility for coordination of policies, plans and operations for the national foreign information program. USIA also had responsibility for disseminating to other departments guidance concerning the official treatment of news in foreign information outlets. In another attempt to correct the PSB's problems, the memo also stipulated that such guidance was authoritative for all departments and agencies. The directive also drew

a line between USIA and DoD responsibilities: USIA had responsibility for the foreign information program only in areas that were not military theaters of operations or where U.S. troops were actually engaged in combat operations. Since this NSC Memorandum also reconfirmed CIA's responsibility for covert psychological operations in accordance with the applicable NSC directives (NSC 10 series), this relegated DoD to military psychological operations matters only, and an advisory role for the rest.[58]

This same directive also rescinded NSC 59/1, which had established the Psychological Operations Coordinating Committee (POCC), and established a new organization to provide OCB with a forum for carrying out its psychological operations responsibilities. Chaired by the Executive Secretary of OCB, other members included representatives from DoD, State, CIA, JCS, USIA, and the Foreign Operations Administration. The Service's psychological warfare chiefs established in DoD Directive S-3140.1 served as consultants. All of the members also provided personnel to be a full-time staff, with OCB providing administrative support.[59]

Throughout the rest of his time in office, Eisenhower continued to refine his mechanisms for coordinating national security policy and the national psychological operations effort. On 25 February 1957, Executive Order 10700 changed OCB's status from an independent coordinating board to actually part of the National Security Council structure. The Executive Order also changed the OCB chairman from State Department to whomever the president designated[60] – and Eisenhower's first choice was Gordon Gray.[61]

On 4 June 1958, Eisenhower signed NSC 5812/1, which dealt with wartime responsibilities for psychological operations. Recognizing that "no single department or agency having responsibility in the field of psychological operations can feasibly perform these operations for the entire Executive Branch," this directive specified the responsibilities of DoD, CIA, USIA and DoD under a variety of conditions. Eisenhower covered not just the general wartime responsibilities, but also which department or agency was in charge, depending on whether the target audience was friendly, neutral or hostile, and within or without the theater of operations. The directive also specified the workings of the coordination and flow of guidance from Washington to overseas and back.[62]

THE MIDDLE COLD WAR

The next two decades after Eisenhower's term constituted an "Ice Age" for strategic influence. The interagency structures and committees that Truman and Eisenhower built to coordinate strategic influence disappeared. The psychological warfare offices in DoD, JCS and

the Army dissolved, as did their coordinating committees. The few people on the staff who retained some responsibility, now lowly action officers rather than generals or Assistant Secretaries, lost direct access to the decision makers – an access that has never been regained. The military psychological troop units demobilized after the Korean War, except for one lone unit at Fort Bragg. Even before President Kennedy's assassination, the focus of the Psychological Warfare Center had changed to special operations – even the name had changed, to Special Warfare Center. As one writer put it, "The congenial climate for American psychological operations was polluted in the seventeen years that followed 1956; not until President Reagan's Westminster speech was there again much sunshine."[63]

Subsequent administrations still used information and psychological methods in the Cold War, but they no longer received top-level attention. The elements of strategic influence still existed, but were compartmentalized throughout the departments. CIA retained the covert operations mission. State Department conducted its traditional foreign diplomacy mission, and USIA had the overt foreign information mission. However, starting in the 1960s, the USIA shifted focus. The informative function, focusing on objective, factual reporting of news, gained emphasis, while attention on the persuasive function and the function of advising other departments on psychological implications declined.[64]

The various administrations during this period did not create any permanent overarching committees to coordinate psychological activities within the government. Departments and agencies were expected to coordinate with the others, but no one "ran the show". There was no national level effort to direct and coordinate the timing of acts to ensure maximum effect. Ad hoc committees sometimes appeared to fill the vacuum, but these were usually narrowly focused and of short duration.

Party politics played a key role in this change. Eisenhower carried over into his Administration people who had been key in Truman's Administration, such as Gordon Gray. Kennedy, much like modern presidents, brought in a whole new team. Kennedy also, both personally and as a Democrat, had a vastly different view of the role of the National Security Council and its organization.

Another key factor appears to be the loss of a voice of sufficient stature to influence the top levels of the government. This may have been due to a generational change and lack of direct experience. The Truman and Eisenhower Administrations had been filled with high-ranking World War II veterans who had worked together, or at least known one another, during the war, and who had had to consider the implications of psychological warfare at the theater level. Starting with Kennedy, World War II veterans in the Administration tended to have been

junior or field grade officers, with virtually no propaganda experience except at the receiving end. Truman and Eisenhower had many advocates for strategic influence; Kennedy and Johnson had few.

Prior to Kennedy taking office, Senator Henry M. Jackson headed a congressional inquiry into government methods for formulating national policy in the Cold War. Jackson's report was highly critical of Eisenhower's National Security Council system, deeming it a bloated paper mill that didn't accomplish much real work, and that exceeded what he envisioned as the proper role for the Council. Jackson viewed the National Security Council as a small forum of intimates for the President to explore intelligence and policy options; he believed it ill-suited for comprehensive coordinating and follow-through of responsibilities.[65]

Jackson recommended a complete reorganization of the National Security Council, starting with the abolishment of the OCB. He believed that State Department should not only have control over foreign information policy, but should also be the agent of coordination on all major policies toward other nations. In his view, OCB infringed on this basic responsibility. Jackson also saw no need for permanent interdepartmental committees. He believed that the lead agency should have responsibility for implementation of policies cutting across departmental lines, with possibly the assistance of an informal, temporary interdepartmental group.[66]

Jackson's views dovetailed completely with Kennedy's own views. Less than a month after taking office, Kennedy issued Executive Order 10920, abolishing the OCB. Over 45 interagency committees died with OCB. In the next few weeks, Kennedy continued to dismantle Eisenhower's system, abolishing another 40 interdepartmental groups. The National Security Council staff decreased significantly and lost much of its power.[67]

Kennedy did not completely abandon psychological warfare, due to the focus on counter-insurgency throughout his term. Kennedy issued a number of National Security Action Memorandums (NSAM) directing increased emphasis, spending and action in counter-insurgency. While psychological activities rarely received primacy, they were normally imbedded in many of these policy directives. Four in particular demonstrated that the Administration did not ignore information as an element of national power.

NSAM 3, issued 15 April 1961, directed the Bureau of Budget to study continued CIA funding of activities such as Radio Free Europe, and whether open government support would be better. Someone had raised the very valid concern that if the CIA cover were compromised, the program would lose credibility and therefore most of its effectiveness.[68]

NSAM 61, issued 14 July 1961, directed the State Department and USIA to use their means to support and disseminate an approved counter-theme to combat a Soviet propaganda theme called “peaceful coexistence”.[69]

NSAM 63, issued ten days later, directed the State Department, through the USIA, to provide foreign policy guidance to all international radio broadcasting and television stations controlled by U.S. Government agencies. These included DoD stations, such as the Armed Forces Radio and Television Service and the Voice of the United Nations Command in Korea. NSAM 63 also gave the USIA the authority to preempt any of these stations as needed for “special programs”.[70]

Kennedy did establish some interdepartmental groups, which he called “Special Groups”. On 18 January 1962, NSAM 124 established the Special Group (Counter-Insurgency). Special Group (CI) functions included insuring that all U.S. Government agencies recognized that subversive insurgency was a major form of politico-military conflict on a par with conventional war, and that such recognition was included in the “political, economic, intelligence, military aid and informational programs conducted overseas by State, Defense, [U.S. Agency for International Development], USIA and CIA.”[71]

During the Vietnam years, the U.S. Government and DoD again established a fairly robust psychological operations effort to support the war. But this effort was narrowly focused to that theater, primarily tactical in nature, and did not last once the war ended.[72]

A study on national coordination of psychological operations conducted by the Joint Staff in the early 1970s noted that an ad hoc committee approach had arisen to fill the void caused by both a lack of coordination and insufficient authority at high enough level providing guidance for psychological operations. One example cited was the Psychological Operations in Critical Areas Watch Committee (POCA). Another ad hoc group, the Interagency Working Group on Psychological Operations in Critical Areas, had formed POCA based upon a 1965 USIA study. The Joint Staff deemed POCA moribund at the time of its study, as POCA had had no meetings since May 1969, even though the memorandum of agreement establishing it was still valid.[73]

Military psychological operations units during the Vietnam years traveled the familiar roller coaster track. In the 1960s, the Army had just one psychological operations unit. At the height of the Vietnam War, the Army had a full Group operating in Vietnam, and other psychological operations units stationed in Fort Bragg, Germany, Panama and Okinawa. By the mid-1970s, all that remained in the active component was one Psychological Operations Group – undermanned and with poor, antiquated equipment.[74]

President Johnson's national security system was modeled after Truman[75], but regarding strategic influence resembled Kennedy's. USIA clearly had the lead on psychological warfare programs, and the emphasis was on Southeast Asia.[76] While Johnson strengthened the National Security Council and established interdepartmental working groups, none appear to have dealt directly with strategic influence or psychological operations. A few, limited-scope ad hoc bodies did appear: the Vietnam Psychological Operations Working Group, which had been dormant for over a year by 1967, and the Psychological Operations Pressure Operations Group, which appeared briefly during the latter stages of the Vietnam War.[77] Like Kennedy, Johnson believed that the State Department should have the lead in foreign policy. In March 1966, Johnson signed NSAM 341, which gave the Secretary of State authority and full responsibility for the overall direction, coordination and supervision of interdepartmental activities overseas.[78]

President Nixon reformed the National Security Council more along Eisenhower's lines. Regarding strategic influence, though, he did not resurrect anything similar to the Psychological Strategy Board or the Operations Coordinating Board. Nixon continued a multi-pronged approach with CIA, State, and USIA, responsible for covert psychological operations, public diplomacy and overt information programs, respectively. DoD continued to have responsibility for psychological operations only in military theaters of operations.

Nixon did issue a number of National Security Decision Memorandum (NSDMs) which had informational or psychological components: NSDM 3, "Direction, Coordination and Supervision of Interdepartmental Activities Overseas"; NSDM 7, "Direction, Coordination and Supervision of Interdepartmental Groups"; NSDM 19, "Washington Special Actions Group"; NSDM 23, "Vietnamese Special Studies Group"; and NSDM 40, "Responsibility for Conduct, Supervision and Coordination of Covert Action Operations". Only one dealt directly with psychological operations: NSDM 63, "Psychological Warfare Operations Against Vietnamese Communists".[79] This NSDM continued the national-level narrow strategic influence focus on the Vietnamese theater, as opposed to a global focus. Unfortunately, further information dealing specifically with these NSDMs or the establishment of any ad hoc interagency committees was unavailable or still classified.

The lack of attention at the upper levels of the government on strategic influence and the limited focus on Southeast Asia led to a reduction in effectiveness against Communist propaganda worldwide. Most U.S. efforts outside the Vietnam theater were negated by the virulent anti-Vietnam movement, and the highly effective Soviet and Communist psychological operations programs, which were both strategic and global.[80] At the time, both JCS and the Army strongly recommended the establishment of a permanent standing committee with

broadened responsibilities to coordinate implementation by all government agencies of the psychological aspects of decisions rendered by the National Security Council.[81] Their recommendations fell on deaf ears. As one writer put it, "During the Vietnam years, in spite of some notable successes with psychological and political techniques of counterinsurgency warfare, the US military and the government as a whole proved unable to devise and execute an overall strategy that took due account of the vital importance of the psychological-political dimension of the struggle."[82]

President Carter continued the separation of the elements of strategic influence among CIA, USIA, State Department and DoD. However, in his restructuring of the National Security Council system, he established two new committees that included information policy within their scope, but not as a primary focus. The Policy Review Committee developed national security policies in those areas that were the primary responsibility of one department but where the subject also had important implications for other departments. These areas included foreign policy issues with significant military or interagency aspects and defense policy issues having international implications. The Special Coordinating Committee handled sensitive intelligence activities and covert operations.[83]

REAGAN AND BEYOND

Under President Reagan, strategic influence experienced a rebirth, buoyed by his emphasis on foreign policy and determination to win the Cold War. During his terms in office, the press dubbed Reagan "the Great Communicator" for his ability to use his speeches to gain support for his policies. It is an equally apt term for what he accomplished for strategic influence.

Reagan's initial national security strategy contained four basic components: diplomatic, economic, military and informational.[84] This was the first time that information had been elevated from a supporting instrument to a top element of national strategy. This emphasis on information and the psychological component – on strategic influence – of national security strategy continued throughout his terms.

Three National Security Decision Directives (NSDDs) built the cornerstone of Reagan's strategic influence policy: NSDD 45, signed 15 July 1982; NSDD 77, 14 January 1983; and NSDD 130, 6 March 1984.

NSDD 45 revitalized the U.S. international broadcasting program, declaring it an important instrument of national security policy. It directed quantum improvements in the quality and capabilities of US-controlled broadcasting stations, such as Voice of America, Radio Free

Europe/Radio Liberty, and Radio in the American Sector of Berlin. The directive established Radio Marti, to garner and consolidate anti-Castro support in Cuba and among Cuban exiles in the U.S. Reagan specifically stipulated that the money and other resources required to implement his improvements were to be given the same priority as other programs deemed vital to the national security.[85] NSDD 45 also directed that State Department give high priority to the diplomatic requirements for modernizing and expanding these stations, with particular emphasis on obtaining international support to halt and deter Soviet jamming of the stations and to develop countermeasures to that jamming.[86] Reagan foresaw the future of space-borne platforms and initiated further research into direct broadcasting by satellite. Finally, NSDD 45 directed a study between State and DoD on closer integration and role of broadcasting facilities in crisis and war.[87]

NSDD 77 established a Special Planning Group (SPG) under the National Security Council to strengthen the organization, planning and coordination of the various aspects of public diplomacy related to national security. Chaired by the President's National Security Adviser, SPG members included the Secretaries of State and Defense, the Director, USIA, and the Assistant to the President for Communications, with other agencies invited as needed. The directive indicated the importance Reagan placed on strategic influence by listing department and agency principals as the primary members, although they could designate an alternate.[88]

NSDD 77 also established four interagency standing committees that reported to the SPG: the Public Affairs Committee, the International Information Committee, the International Political Committee, and the International Broadcasting Committee. The latter committee had responsibility for planning and coordinating international broadcasting activities pursuant to NSDD 45.[89]

NSDD 77 gave the Public Affairs Committee responsibility for the planning and coordination of major speeches on national security subjects, and for the planning and coordination of public affairs for foreign policy events and foreign and domestic issues with a national security dimension. The International Information Committee had responsibility for planning, coordinating and implementing international information activities in support of US national security interests. This committee dealt almost exclusively with USIA activities, and was chaired by the Director, USIA.[90]

The International Political Committee had a broader role than the other three. Headed by the State Department, it had responsibility for planning, coordinating and implementing international political activities in support of US national security interests. These activities included State Department's role in foreign aid, in training and organizational support for

democratization, and coordination and cooperation with non-government organizations and private voluntary organizations that supported democratization. NSDD 77 specifically directed the International Political Committee to develop means to increase the U.S. Government capability to promote democracy, "as enunciated in the President's speech in London, 8 Jun 82," known as the Westminster speech. The directive also directed the committee to develop and implement plans, programs and strategies to counter totalitarian ideologies and political action by the Soviets. Additionally, NSDD 77 gave the State Department some authority to direct other departments to implement political action strategies in support of objectives established by the International Political Committee.[91]

While Reagan was generally pleased with the progress made under NSDDs 45 and 77, he did not feel that the departments had gone far enough, nor that they were maintaining focus. On 6 March 1984 he signed NSDD 130 to re-emphasize and clarify his policy on strategic influence.[92]

NSDD 130 reiterated the importance of U.S. international information programs to national security, expanded Reagan's policies set out in NSDDs 45 and 77, and directed "sustained commitment over time to improving the quality and effectiveness of U.S. international information efforts" – including improving the level of resources devoted to international information activities and their coordination with other elements of national power. Areas highlighted for improvement included designing products for different cultural target audiences, further enhancing international radio broadcasting, and reconstituting a program for disseminating books and other publications abroad. NSDD 130 directed studies into more effective use of international television broadcasting, including the new audio and videocassette technologies, and into how to utilize new communications technologies to penetrate closed societies. NSDD 130 also addressed functional and personnel requirements, including development of career tracks and education programs.[93]

NSDD 130 also directed great changes and improvements for DoD. First, NSDD 130 directed DoD to give a high priority to the revitalization and full integration of PSYOP in military operations and planning. Second, Reagan directed DoD to participate in overt PSYOP programs in peacetime. Third, he tasked the SPG to lead the development of coordinated interagency international information plans that included utilizing DoD capabilities. Fourth, NSDD 130 directed all departments and agencies to develop special procedures to ensure policy consistency and timeliness in international information programs during crisis and war.[94]

When NSDD 130 was published, DoD undertook a major review and evaluation of military psyop capabilities. That review showed that DoD capabilities had significantly atrophied

Page 3231 of 3957

since the Vietnam War. DoD's solution to correct its deficiencies was the DoD Psychological Operations (PSYOP) Master Plan of 1985. This watershed document provided a comprehensive plan for the fundamental improvement of DoD PSYOP capabilities worldwide, across the spectrum of conflict.[95]

Throughout DoD, PSYOP offices were re-established or improved. DoD created a PSYOP directorate, the first such office on the staff in over 20 years. JCS upgraded its PSYOP staff element from a branch to a division. The Department of the Army Staff upgraded its PSYOP staff element from a one-man shop to a PSYOP and Civil Affairs division.[96] Both Active and Reserve PSYOP units experienced growth in personnel, more funding for training, exercises and operations, and received updated equipment.

One important directive of the Master Plan was the separation of PSYOP staff elements from special operations staff elements throughout DoD, including the military departments, the Joint Staff, Service staffs, unified and specified command staffs and their components. The DoD review had determined that the subordination of PSYOP personnel under special operations "de-linked" the PSYOP personnel from broad support of national policy and objectives and critical interagency coordination. The Plan also noted that PSYOP personnel in special operations staffs tended to work PSYOP issues only part-time, and the placement within special operations staffs contributed to a continuing lack of understanding within DoD of PSYOP. It also tended to reinforce the misperception by both military and civilian senior leaders that PSYOP focused primarily on special operations.[97]

The 1985 PSYOP Master Plan also called for the creation of a Joint PSYOP Center (JPOC), dedicated to the long-term development and nurturing of joint PSYOP capabilities in DoD. Among the responsibilities envisaged for the JPOC would have been developing long-range strategic PSYOP plans, and assisting both JCS and the Office of Secretary of Defense (OSD) to develop, plan and coordinate the DoD portion of national psychological operations activities. DoD placed the implementation of the JPOC on hold pending resolution of several issues resulting from the congressionally mandated reorganization of special operations, including the creation of the U.S. Special Operations Command (USSOCOM). Once military PSYOP was placed under USSOCOM, the implementation of JPOC was never executed – lost in the internecine battle for resources within USSOCOM.[98] Nevertheless, the other directives within the PSYOP Master Plan greatly strengthened and improved military PSYOP.

Reagan provided additional guidance to DoD for increasing psychological operations with Executive Order 12333. Reagan wanted to increase and expand the execution of

democratization programs in Latin America. The EO established a presidential finding for CIA covert psychological activities and directed DoD to initiate several programs in the region.

On 26 July 1984 DoD published DoD Directive S-3321.1, *Overt PSYOP Conducted by Military Services in Peacetime*, in direct response to NSDD 130 and Executive Order 12333. This directive is still valid and used daily as the policy guidance for peacetime PSYOP. DoD Directive S-3321.1 established the Overt Peacetime PSYOP Program (OP3), still operative today. Under OP3 each regional combatant commander develops and submits a plan for conducting peacetime psychological activities to support combatant commander and national security objectives within their area of responsibility. These activities are not limited to military PSYOP units, nor even to military activities – regional combatant commanders can recommend that other departments execute certain activities. Combatant commanders coordinate their OP3 plans with Ambassadors in their region, and then submit the plans to JCS. JCS obtains concurrence within the military side of the Pentagon, while concurrently sending the proposed OP3 plans to OSD. OSD then coordinates within the interagency for review, comment and deconfliction. JCS passes approval of the plans back to the combatant commander once OSD has approved the plans. This process ensures that all the key players have had an opportunity to review the OP3 plans before the combatant commander executes the plan. [99]

Reagan also created the National Endowment for Democracy (NED) as a mechanism for overseeing disbursement of funds for the support of democratic political and cultural institutions abroad.[100] In his Westminster speech, Reagan proposed an initiative "to foster the infrastructure of democracy – the system of a free press, unions, political parties, universities – which allows a people to choose their own way, to develop their own culture, to reconcile their own differences through peaceful means."[101] Congress authorized NED as part of the Fiscal Year 1984/85 State Department Authorization Act. Since its inception NED worked closely with State, USIA and, especially, private sector groups to foster abroad cultural values, institutions and organizations of democratic pluralism. By 1992, both Canada and the United Kingdom had developed similar grant programs. NED is still extant today as an independent organization which continues to work with the private sector to promote democratic institutions around the world.[102]

Despite a setback from the Iran-Contra Affair, the success and potency of Reagan's strategic influence program directly contributed to President George Bush's ("Bush I") success in building and maintaining a coalition during the Gulf War. Reagan's improvement of U.S. military PSYOP capabilities also directly resulted in a highly successful psychological operations campaign during the conflict.

When Bush I took office, many "Reaganites" continued to serve in the new administration. Bush I continued many of Reagan's policies and practices, but not all of them. Many of the Reaganites tried to re-establish the best of Reagan's conventions, particularly those dealing with strategic influence. However, none were of sufficient stature to "carry the torch" through either the aftermath of Iran-Contra or the distraction of the re-election season. During the Gulf War, Bush's National Security Council did establish and chair an ad hoc committee, the PSYOP, Propaganda and Public Diplomacy Committee (3PD). 3PD included representatives from OSD, State Department, USIA, CIA and JCS. The committee generally met at least twice a week, and focused on coordination and exchange of information between the participating agencies, rather than tasking or execution of activities. 3PD ended quickly after the Gulf War. OSD and JCS, with positive endorsements from the other members, led a drive to get it permanently established, but NSC never took action. Most of the senior Administration officials did not see the utility of a standing committee in peacetime.[103]

On 28 March 1990, Bush I signed National Security Review (NSR) 24. NSR 24 directed a broad examination of U.S. Government international broadcasting activities in the context of overall U.S. foreign policy objectives. The dramatic changes in the word political situation – the reintegration of Germany, the fall of the "Iron Curtain" and the pending dissolution of the Soviet Union – prompted the complete review of the mission, objectives and resource implications of government broadcasting. Bush I intended to use the response to NSR 24 for short-term decisions in the next two years. The NSR was very comprehensive, including directives for both a detailed assessment of current and future roles, and for the development of a broad range of policy options.[104]

Six months later, Bush I superseded NSDD 77 with National Security Directive (NSD) 51. NSD 51 reaffirmed the four basic missions for U.S. Government international broadcasting: explaining U.S. policies and actions to foreign audiences; describing and explaining American culture and institutions; providing objective news, commentary and information about U.S. and world events; and providing surrogate programming to areas of U.S. interest where there is not a free press. Additionally, NSD established a Policy Coordinating Committee on International Broadcasting, chaired by State. However, NSD 51 also directed the consolidation of broadcasting operations and other austerity measures due to constrained budget levels.[105]

Perhaps the most important directive in NSD 51 was the appointment of an independent bipartisan task force to study U.S. broadcasting assets, activities and technologies. Further, Bush I directed the task force to provide him with recommendations on the most appropriate organization and structure for a single U.S. Government broadcasting entity. This was the

genesis of the Broadcasting Board of Governors (BBG). . On 1 October 1 1999, as part of the 1998 Foreign Affairs Reform and Restructuring Act, the BBG became an independent, autonomous entity responsible for all U.S. Government and government sponsored, non-military, international broadcasting.[106]

One outcome of the Gulf War was the rise in the military of the term "command and control warfare" (C2W). C2W was a new concept for disrupting an enemy's decision cycle. C2W consisted of five elements, called "pillars": PSYOP, electronic warfare, deception, operations security, and physical destruction, all supported by intelligence as the foundation. By the end of the 1990s, C2W had become a subset of the broader "information operations," which added computer network operations and critical information infrastructure defense to the original five pillars.

When President Clinton took office, he abolished what remained of Reagan's and Bush's strategic influence interagency mechanisms. However, most of the military gains – the PSYOP Master Plan, OP3, and the improvement in military PSYOP troop units – remained, even through the post-Gulf War drawdown.

In the late 1990s, Congress pushed for significant decreases in the foreign policy budget, including public diplomacy, under the pretext that with the winning of the Cold War, such a large public diplomacy machine was no longer needed – in reality, Congress was looking for money for domestic programs. In 1998, Congress passed the Foreign Affairs Reform and Restructuring Act. Among its many actions, the Foreign Affairs Reform Act disestablished the formerly independent USIA, and merged its functions and missions under the cognizance of the Department of State, within the new Under Secretary for Public Diplomacy & Public Affairs.[107] The same act slashed the State Department's budget, a condition that persisted for over a decade. In 2001 the share of the budget devoted to international affairs was only 1.18 percent.[108]

By the end of the 1990s, the rise of the Internet and global media capabilities led to vast amounts of information, misinformation and opinions being available to the global audience. Much of the information and opinions spread by these new communications means did not reflect well on the U.S. or support national security objectives. Yet until 1999, the Clinton Administration did not have any specific national security policy concerning public diplomacy, international information, or information operations.[109] Two key events in which information was used to devastating effect – the Balkans and the genocidal wars in Rwanda – galvanized Clinton into developing a national security policy to better fight this "new" war of ideas.[110]

On 30 April 1999, President Clinton finally established a policy on strategic influence by signing Presidential Decision Directive/NSC-68, "International Public Information". The overall objective of this presidential decision directive (PDD) was to "promote understanding and support for U.S. foreign policy initiatives around the world."[111] PDD 69 goals included developing and executing a more effective and coordinated international public information (IPI) strategy, countering the growing hostile misinformation about the United States, and more effectively promoting U.S. policy, values and interests to foreign audiences. Most importantly, the PDD sought to harmonize and synchronize at the national level the efforts of all the various players and planners in IPI – including what the PDD terms "overt international military information."[112]

PDD 68 directed three key implementation strategies to ensure that IPI was integrated into national security policy-making. First, PDD 68 established the IPI Core Group (IPICG) as the interagency working group responsible for coordinating the activities and efforts of all government agencies that planned and conducted IPI activities.[113]

The State Department chaired the IPICG, with NSC serving as deputy chair. Other permanent members included Assistant Secretary-level representatives from DoD, JCS, USAID, and the National Security Council, plus a stipulation for others as required, and the option to establish sub-groups on regional, functional and transnational issues as appropriate.[114]

Second, PDD 68 directed the development of a national IPI strategy, including IPI plans for potential major regional and transnational challenges and contingencies. Plans were to address U.S. responses, resources required, scope and duration of IPI activities, and the desired result. The PDD also directed that these IPI plans be integrated into interagency planning as mandated in PDD 56, "Managing Complex Contingency Operations."[115]

Third, PDD 68 directed the IPICG to work with U.S. Government educational institutions to develop and conduct annual education and training activities designed to foster expertise in IPI and promote better coordination.[116]

At the instigation of OSD and Joint Staff, PDD 68 also directed the detailing, on a full-time, non-reimbursable basis, of one or more military personnel to the IPICG Secretariat, in recognition of the "predominant interest of DoD."[117]

PDD 68 was initially welcomed by the parties involved in its crafting. There had been no presidential guidance on strategic influence since Reagan's NSDDs in the 1980s. And as USIA had been the primary means of "telling America's story" overseas during the Cold War, there was growing concern about the U.S. Government's ability to influence foreign audiences. PDD 68 was seen as a way to alleviate these concerns.[118]

However, PDD 68 ran into problems almost from its inception. State Department had the chair, but did not have the necessary direction and tasking authority over the other departments. Meetings turned in reporting forums rather coordinating arenas.[119] The State Under Secretary also hesitated in acting and forming the IPICG; in two years only two meetings of the formal IPICG were convened, although action officers did meet. Resourcing was another issue. PDD 68 did not specifically provide any means or resources to the IPICG or to the implementing agencies. The departments hesitated to expand upon or initiate any new information activities without the assurance of funds to do so.[121]

PDD 68 was also an unclassified document. It soon appeared in the media, and critics abounded, from journalists, to former officials, to current "unnamed" officials. Criticism ranged from those who thought it would be no more than a global spin machine, to those who thought it would filter information normally widely available to reporters, to those who thought it was meant to propagandize the American public, to those who thought the party in power would use it as a political tool.[122]

PDD 68 did have some accomplishments before its denouement. Under the IPICG, the Balkan IPI Working Group has been very effective in coordinating IPI activities in support of the continuing operations in Bosnia and Kosovo. And PDD 68 was the genesis of what is today a very close, mutually beneficial working relationship between DoD, the Broadcasting Board of Governors and the Voice of America.[123]

STRATEGIC INFLUENCE TODAY

Shortly after taking office, President George W. Bush issued National Security Policy Directive (NSPD) 1, which restructured the NSC system. NSPD 1 abolished all of Clinton's standing interagency working groups (IWG) and ad hoc groups. Instead of IWGs, Bush established policy coordination committees (PCC). NSPD 1 established a number of PCCs; more would be established in later NSPDs. NSPD 1 also recreated some of Clinton's IWGs as subcommittees under one of the new PCCs.

The IPICG was one of many former IWGs that languished for several months, awaiting a decision from the new Administration. Eventually Bush decided to grandfather PDD 68, and the IPICG became a subcommittee under the new Counter Terrorism PCC. However, the IPICG lost momentum as an interagency coordinating body during its time in limbo. While it still continued to operate, it became primarily a State Department operation.[124]

The events of 11 September 2001 changed everything, not least of which was the administration's outlook concerning strategic influence. Faced with direct evidence that many people around the world actively hated the United States, Bush began taking action to more effectively explain U.S. policy overseas.

Initially the White House and DoD turned to the Rendon Group, a private public relations firm that was already under contract to burnish the U.S. image overseas. Rendon focused on the immediate 24-hours news cycle as a means to shape opinions, rather than a long-term ideological change. Rendon helped create Coalition Information Centers (CIC) in Washington, London and Islamabad. Personnel in these offices prepared daily press releases and responses to any enemy propaganda in the news, conducted polling and held focus groups, and coordinated the appearances of U.S. officials on key Arabic television programs to occur at strategic, highly watched moments.[125] Over time, Rendon's work was supplanted by other organizations.

In October 2001, Bush swore in Charlotte Beers as the new Under Secretary of State for Public Affairs and Public Diplomacy. Beers had been a highly successful advertising executive on Madison Avenue. Secretary of State Colin Powell and President Bush hoped that Beers would be able to use her advertising skills to rejuvenate State's public affairs and public diplomacy programs to sell American policy and values overseas.[126]

Reactions to Beers' appointment and to her first year in office have been mixed. Many critics doubt that the skills which succeed in selling a brand-name product to American consumers translate well into skills needed to sell policy and win a war of ideas with foreigners. Many complain that world opinion has changed little, or even worsened in the last year. Others feel that Beers has initiated several programs that may have an impact over time.[127]

Early in August 2002, Bush announced the creation of the Office of Global Communications (OGC) to help manage and shape the U.S. image abroad.[128] Five months later Bush signed Executive Order 13283, officially establishing OGC within the White House Office. Bush assigned OGC the mission to advise the President on the most effective means "to ensure consistency in messages that will promote the interests of the United States abroad, prevent misunderstanding, build support for and among coalition partners of the United States, and inform international audiences." This advice was to be given only for overt information activities.[129]

Other OGC functions specified in the Executive Order include assessing methods and strategies used by the government; coordinating the formulation of messages among appropriate agencies; working with other departments to develop a strategy for disseminating

"truthful, accurate and effective messages" about American policies, people and culture; and coordinating the creation of temporary communication teams that would deploy to areas of high global interest and media attention. Teams could not deploy without consultation with State Department and DoD.[130]

Like the Rendon Group, OGC is focusing on the short-term goal of winning the evening news cycle rather than making any long-term effort to change attitudes and opinions. Its messages are more informative, more journalistic, than persuasive. OGC reports only to the White House; it is not within the NSC structure, although it does coordinate with the two PCCs discussed below. Despite its direct link to the White House, OGC does not have any tasking authority. The last line of the Executive Order specifically states that OGC does not have authority to issue directives to other agencies.[131]

Bush split the remaining elements of strategic influence between two PCCs, the Counter Terrorism Information Strategy (CTIS) PCC and the Strategic Communications PCC (SC). NSC chairs the CTIS PCC, which is responsible for countering terrorist hostile propaganda and contains at least one subgroup, the Counter Propaganda Working Group. Both CIA and DoD participate in the CTIS PCC. NSC and State Department act as co-chairs of the SC PCC, which is responsible for overt public affairs and public diplomacy. The SC PCC has four subcommittees: Future Directions, Afghanistan, Iraq, and the State Fusion Center. Neither CIA nor DoD attends the SC PCC. And while the NSC chair of the CTIS PCC attends SC PCC meetings, the reverse is not true.[132]

In August 2002, Congress also approved spending $225 million on cultural and information programs abroad, mostly targeting Muslim countries. Representative Henry Hyde sponsored the bill, citing a need to correct a "cacophony of hate and misinformation" about the U.S. "[133]

In March 2002, the U.S. Broadcasting Board of Governors (BBG) launched Radio Sawa, an Arabic entertainment and news station that can be heard throughout the Middle East. Within just a few months, ratings increased by 33%. The BBG is now planning a television counterpart.[134]

In 2001, OSD established the Office of Strategic Influence (OSI), in an attempt to fill the gaps between Bush's PCCs and the OGC. Officials within DoD were also concerned about the void left from the nonfunctional IPICG. Bush's organizations took a long time to become fully established and begin working. DoD also felt that the three organizations were too narrowly focused on explaining U.S. policy to broad, global audiences. None appeared to be focused on

specific target audiences, with a specific strategy and objectives in mind, or on the government actions needed to affect long-term U.S. goals.[135]

OSI was headed by Major General Worden, U.S. Air Force. OSI was nominally under the Assistant Secretary of Defense for Special Operations and Low Intensity Conflict (ASD SOLIC), who had policy oversight of psychological operations, but it reported directly to the Under Secretary of Defense for Policy. DoD did not envision that OSI would be solely a DoD organization. OSI sought input and representatives from other departments from the beginning. DoD hoped that OSI would be a catalyst for action, and once it started developing and implementing influence campaigns, State would take a bigger role, and eventually OSI would become an interagency body.[136]

MG Worden had a vision, plans and objectives for what he believed OSI should accomplish in support of national objectives – something that was lacking in the other players in strategic influence at the time. One of the first things OSI looked at was how to affect change in the madrassas, the Muslim schools, where the current curriculum and textbooks are virulently anti-American.[137]

In a classic example of the internecine battles that have always plagued strategic influence, OSI was sabotaged internally within DoD and abolished by Secretary of Defense Donald Rumsfeld less than five months after its establishment. Someone in DoD leaked information to the press that OSI intended to plant false messages and misinformation in overseas media, news that would then be reported in the U.S. as factual. This type of action was not in OSI's charter, and the charge was never substantiated. Nonetheless, Rumsfeld felt that the damage caused by the media controversy and exposure were too great to overcome, and he closed the office.

All that remains in OSD for strategic influence is a small Office of Information Activities (OIA) buried within ASD SOLIC. OIA has retained responsibility for policy oversight of military psychological operations activities. It also provides the OSD representative to the CTIS PCC. OIA hopes to implement a few of the actions recommended by OSI, but with few resources, few personnel, and little authority, its effectiveness is doubtful. Additionally, OIA is maintaining a low profile, due to fears that whoever sabotaged OSI will also sabotage OIA.[138]

JCS currently has a PSYOP division, generally six personnel headed by an Army O-6, within the J-39, Deputy Director for Information Operations (DDIO), a directorate that has existed only since 1997. Other divisions within DDIO have responsibility for other elements of information operations. The DDIO himself is a brigadier general; the first three have been Air Force generals. This gives functional responsibility for a majority of strategic influence to a

general or flag officer, something that had been missing for decades. The PSYOP Division has a multitude of responsibilities: coordinating PSYOP policy within JCS; developing and staffing JCS positions on DoD and national policy regarding PSYOP; promulgating joint PSYOP doctrine; representing JCS in the interagency; preparing and staffing deployment orders for PSYOP units; shepherding approval of PSYOP plans and orders within JCS and the Services; providing national-level PSYOP guidance to the combatant commanders; staffing PSYOP product approval within JCS and with OSD, when approval has not been delegated to the regional combatant commanders; and providing the U.S. representative to the North Atlantic Treaty Organization (NATO) PSYOP Working Group.[139]

When the War on Terrorism started in the Fall of 2001, JCS established the Information Operations Task Force (IOTF), at the direction of the Chairman of the Joint Chiefs of Staff (CJCS), General Myers. Originally, the CJCS intended the IOTF to be an interagency group that would direct information and influence operations and act as the single point of contact for the U.S. Government; its original title was "Information Operations Resource Center (IORC)." But no other agencies or departments would participate in the IORC. No other agency wanted to put their people under a DoD brigadier general.[140]

When the IORC didn't become an interagency group, JCS established the IOTF. It was given space, but few other resources. DDIO stripped almost two-thirds of its own people, including all of the PSYOP Division, away from their normal duties to fill the IOTF.[141]

The IOTF was largely ineffective and was disbanded in July 2002. It initially developed a system of public affairs, PSYOP and information operations "alerts" to provide guidance and information to DoD senior officials and the regional combatant commands. No one ever used the public affairs or PSYOP alerts. The information operations alerts became just "FYI" notes for the DoD leadership, rather than action documents. The alert system had been designed to address both foreign and domestic audiences; however, the focus quickly changed to domestic audiences to gain public support for the War on Terrorism. One positive outcome of this ill-conceived idea was that PSYOP Division personnel were returned to their normal duties, due to concerns over violation of the Smith-Mundt Act.[142]

The IOTF did create an excellent, scientific database to measure and track "Measures of Effectiveness" (MOE) for information operations. Effective MOE tracking is a shortcoming in PSYOP and information operations. However, many DoD officials questioned the resources and effort put into the MOE database when there was not an effective information operations program to track. As one official put it, "we had the Cadillac of MOE databases with the Yugo of information operations campaigns."[143]

Within the Armed Forces, there is still only one active duty organization, the 4th Psychological Operations Group (4th POG). It is a de facto national asset. This one unit provides support to all levels of DoD, from brigade to unified command, to both conventional forces and special operations, and to the other Services. 4th POG also frequently provides analytical support and PSYOP products directly to national level agencies and organizations. Within the 4th POG is the Strategic Studies Detachment – a group of high-quality civilian intelligence analysts and area experts who provide detailed PSYOP studies and assessments in support of unified commands and national-level agencies.

In early 2002, Rumsfeld published his Defense Planning Guidance (DPG). The DPG directed OSD, JCS and the Services to develop an "Information Operations Roadmap" to improve DoD capabilities. The DPG included fourteen separate sub-studies that were to be addressed in the Roadmap. These included recommendations for the establishment of a strategic PSYOP detachment, for improved education on information operations, and for improvements in the information operations career field, including the creation of flag officer positions.[144]

The DPG itself and the Information Operations Roadmap developed within DOD remain classified. The Roadmap does recommend a significant budget increase for military PSYOP. It also recommends the establishment of a strategic PSYOP unit. Officials in DoD are not commenting on what the unit will look like, where it will be located or to whom it will report. Experts in the field believe that it should be located in the Washington, D.C. area, to properly integrate into the interagency strategic influence effort, including providing support to other agencies. However, many are afraid that the controversy over OSI would extend to the new unit and limit its ability if it were located in the area; alternative sites and command structures are being explored.

THE WAY AHEAD

> "Why is the PSYOP contest so asymmetrical? One might assume that a "battle of ideas" should be won by a superpower that has more communications consultants, advertising executives, information and media specialists, political advisers, public relations professionals, and psychologists than the total number of [operatives in Al Qaeda]."[145]

Originally written about the failure of U.S. "hearts and minds" campaigns during the Vietnam War, the quote above is equally valid today. Is the Bush Administration organized

effectively to counter the growing anti-American sentiment around the world? What can the Bush Administration learn from the past?

The strongest periods of U.S. strategic influence had several common features: permanent, rather than ad hoc organizations; specific charters outlining roles and responsibilities for all agencies; top-level interest, guidance and cover; and full-time staffs. Further, the various departments had dedicated full-time people who had direct access to key policy decision makers.

It's ironic that back in Truman's and Eisenhower's Administrations, when the news media was extremely slow compared to today, there was better recognition than exists today that timeliness of decisions and activities is critical to strategic influence. This is particularly true in DoD, where the trained, experienced action officers are buried under layers of staffs levels, often headed by people who have little understanding or appreciation of the psychological impacts of policy. The 21st century information cycle will not wait while an action officer staffs policy decisions through several levels.

The Bush Administration should re-evaluate how it has organized to conduct strategic influence. The current structure is trifurcated, with responsibilities split between three different organizations (OGC, CTIS PCC, SC PCC). Additionally, due to their narrow focus and lack of participation by all departments involved in strategic influence, gaps exist. Areas available for influence are not being exploited.

One person should be in charge of strategic influence for the President - one person, who is a member of NSC, not one of the departments, agencies, PCCs, or OGC; one who can direct, coordinate and provide guidance to all. In today's Information Age, the President needs a Special Assistant to the President for Information Activities – a National Information Adviser (NIA). The NIA should be provided a full-time staff, with experts from all the agencies, as Eisenhower did with his second POCC, established in January 1954.

Both Eisenhower's POCC and Reagan's SPG, established under NSPD 77, provide models to build on. The role of the NIA would not be much different from the POCC Chair, the OCB Executive Secretary, or the SPG Chair, the National Security Adviser. The key difference is that national psychological strategy was just one of their myriad duties. Appointing an NIA, with a dedicated staff, whose sole responsibility would be strategic influence, would greatly improve coordination of strategic influence activities and the quality of advice provided to the President. The authority invested in the position would also improve implementation of activities. Both the PSB and IPICG failed because they lacked sufficient authority to direct the coordination and implementation of policy decisions, and because they could not rise above

interagency rivalry. Further, having an NIA should improve timeliness of interagency action. It has taken Bush's SC PCC nearly two years to develop a vision and charter.

Additionally, the Bush Administration needs to articulate a national psychological strategy, a strategy that is as broad and encompassing as the containment strategy of the Cold War. The nuclear threat, combined with other weapons of mass destructions (WMD), is as imminent today as ever. And the threat of another attack like 11 September is even greater. But now many of the potential perpetrators are non-state actors. Just as in the Cold War, the U.S. must use all elements of national power to deter the use of WMD. Strategic influence, as defined in the beginning of this paper, will be key to success. Persuasive information alone will not be sufficient; messages must be backed up by action or they will be ineffectual. Reagan's NSPD 130 provides a starting model, although it needs to be updated. As one writer put it, "NSDD 130 should be dusted off and made required reading throughout the executive and legislative branches. This landmark document established international information as a major instrument of national security policy, and the responsibility of no single agency of the government."[146]

Gordon Gray's priorities upon becoming director of the PSB also provide a good example of how to begin addressing a national psychological strategy. The national psychological strategy should clearly define national interests and objectives. Goals not clearly defined are rarely achieved. Goals specifically defined will guide effective action by the departments; generalized statements will lead to continued inaction and interagency rivalry, and, ultimately, an ineffective strategic influence program. Objectives should include not just adversarial or hostile audiences, but also allies and neutral audiences. The weakening of U.S. alliance structures has been a key strategic objective of U.S. opponents in recent years.[147]

A national psychological strategy should concentrate equally on long-term attitude and behavior changes as on explaining U.S. policy to foreign audiences. The feelings that begat the acts of 11 September did not occur overnight. Those attitudes had been building for years, and they will not change overnight. A national psychological strategy should also incorporate U.S. Government actions that help foster positive changes in the social and political conditions that continue to create animosity towards the U.S. This may include re-examining U.S. policies versus U.S. national interests – is it more in the national interest to continue policies which are engendering such hostile attitudes, or would it be more in the U.S. national interest to modify that policy to mitigate the negative response?

The PSB's first report on its assessment of the U.S psychological efforts noted that, "the contract between the messages of freedom and democracy that were often broadcast and the

Page 3244 of 3957

actions of the U.S. was often stark. The implication was that the current method of policy formulation could be more effective if the message and the actions were more closely coordinated."[148] One of the NIA's responsibilities would be to ensure that psychological impact of policies when communicated to foreign audiences is considered before the adoption of the policy.

Secretary Rumsfeld needs to reorganize DoD as well. First, DoD needs someone with the appropriate position and authority to oversee the policy and to coordinate DoD strategic influence activities among DoD public affairs, military PSYOP, and other military information activities. Just as the President needs an NIA, so too does Secretary Rumsfeld need an adviser who is dedicated to strategic influence. History provides an example – the Deputy for Psychological Policy under Truman. Today, however, a "Deputy for Information Policy" would best be placed directly under the Under Secretary of Defense for Policy (USDP),[149] so that the position would be above that of the several Assistant Secretaries of Defense who are players in strategic influence. OIA should then be moved under the new Deputy for Information Policy.

DoD also needs to formally establish a DoD Committee on strategic influence, as has been done several times in the past. The officers and officials within JCS and OSD do a good job of communicating and coordinating among themselves. However, formalization lends legitimacy and gets attention. Flag officers and senior officials do not perceive ad hoc groups and meetings as being important compared to committee meetings which the Secretary of Defense or the USDP has declared will occur.

One area that the Administration should address immediately is the distrust and antipathy of the military by other departments involved in strategic influence. PSB was based on the false premise that you could separate psychological strategy from national strategy. Equally fallacious in today's world of instant, worldwide communications is the notion that you can separate military psychological activities from public affairs and public diplomacy. There is a prevailing misconception in the State Department and public affairs field that military psychological operations are not truthful, and that contact with PSYOP will somehow taint public affairs and public diplomacy. While there are valid reasons for keeping the messages and activities separated in the eyes of foreign audiences, those reasons do not apply to coordination at the U.S. national level.

The initial strategic influence efforts of the Bush Administration have revealed a typically American myopic viewpoint: Americans assume that other people think as they do and want the same things that American do – that other people want to be like Americans. For instance, one of the first information products developed by Beers was a series of videos showing Muslim life

and activities in the U.S. This exemplifies the naiveté that simply showing America to foreign Muslims would convince them that they would want to emulate America and shouldn't disagree with U.S. policies. It also demonstrated little understanding of how the target audience would view the film - Muslims in this country live in luxury compared to most of the Muslims overseas that the videos targeted. The target audiences could not identify with the film, there was no emotional connection.

The Administration's efforts also appear to be hampered by "political correctness," something that has been a bane for military PSYOP for years. In an effort not to offend anybody, products are bland, without emotional impact. On other hand, terrorist propaganda does not simply reach for hearts and minds; it activates envy, fear and anger by stirring primal emotions.[150] Television provides numerous examples of angry, intense, committed anti-American protestors. Seldom do you see equally emotionally committed people protesting *for* the United States. At some point, strategic influence must go beyond simply informing and educating and must involve the emotions of the target audiences.

> "Painful as it may be to face squarely the question of American cultural inhibitions in the area of psychological-political conflict, the effort is necessary – in order not only to develop intelligent approaches to dealing with them but also to achieve the cultural self-consciousness essential for effective participation in this kind of conflict. It is essential because Americans tend to assume that people everywhere are much like themselves, with similar fundamental motivations and views of the world. But blindness to differences in national characteristics is apt to be a fatal handicap for anyone attempting to affect the psychological orientation and political behavior of foreign audiences."[151]

The answer to the question, "Why do they hate us?," is not just that they don't understand us. Simply explaining U.S. policy, U.S motives, and the U.S. way of life will not change hostile audiences if they perceive our policies as inimical to their way of life. A world-class strategic influence campaign will not be the panacea for overcoming the current difficulties in world opinion. No wizardry in communications can make bad policy decisions or actions palatable. However, having a competent strategic influence campaign is essential to U.S. victory in the War on Terrorism. Without one, anti-American sentiment will continue to grow, and the U.S will be increasingly vulnerable to more attacks like 11 September 2001.

US Army intelligence analyst charged with selling military secrets to China

By Jasper Ward and Kanishka Singh

March 7, 2024 5:12 PM EST · Updated 2 months ago

WASHINGTON, March 7 (Reuters) - A U.S. Army intelligence analyst was arrested on Thursday and charged with conspiring to sell sensitive defense information to China.

Federal prosecutors charged Korbein Schultz with conspiracy to disclose national defense information, exporting defense articles and technical data without a license, and bribery of a public official, the U.S. Justice Department said in a press release.

Schultz, who was arrested at Kentucky's Fort Campbell, was paid approximately $42,000 to provide an individual he believed lived in Hong Kong with information about U.S. plans in the event Taiwan came under military attack, according to the release. Schultz put "personal profit above the security of the American people," Assistant Attorney General Matthew G. Olsen said in the statement. "Today's arrest shows that such a betrayal does not pay — the Department of Justice is committed to identifying and holding accountable those who would break their oath to protect our nation's secrets."

DEFENSE AND INTELLIGENCE ABBREVIATIONS AND ACRONYMS

Foreword

This comprehensive list of intelligence abbreviations and acronyms includes those used presently, as well as those in use for approximately the last ten years. Sources for this list include the last DIA Lexicon published in 1991, numerous glossaries from Unified Command and Combat Support Agency documents, and contributions, from the faculty of the Joint Military Intelligence College. The expansion of any item may vary somewhat from one organization to another, but this list will hopefully contribute to greater standardization.

This editor is indebted to kSgt Hannah Reddy (USA) and SSgt Angela Wimbush (USAF) of the College, who spent many hours in collating this list. Debbie Linesberry of the U.S. Special Operations Command collaborated by adding that command's most frequently used acronyms. 2LT Vincent Littrell (USAF) and SFC Mark McCurry (USA) helped ensure that the list contains as few errors as possible, and the editor extends his thanks for that dedicated assistance.

All users are invited to submit additions and corrections. To promote the usefulness of the list, older or superseded acronyms will be discarded only if their retention would create confusion. This list is also published under the JMIC home page on Intelink, where it will be updated regularly. Readers are urged to send new acronyms or abbreviations by mail to: Defense Intelligence Agency, Joint Military Intelligence College, MC Attn: Dr. R. Swenson, Bolling AFB, Washington, DC 20340-5100: by Ingternet to AFswerg@dia.osis.gov, or by Fax to (202) 231-2171.

Dr. Russell G. Swenson, Editor and Director, Office of Applied Research

AFSPCIP	Air Force Space Command Intelligence Plan
AFSPOC	Air Force Space Operations Center
AFSSE	Air Force Space Surveillance Element
AFSST	Air Force Space Support Team
AFSTC	Air Force Space Technology Center
AFTAC	Air Force Technical Applications Center
AFTACIES	Air Force Tactical Imagery Exploitation System
AFTF	Air Force Task Force
AFTFWC	Air Force Tactical Fighter Weapons Center
AFV	Armored Fighting Vehicle
AF/VC	Air Force Vice Chief of Staff
AFWAL	Air Force Wright Aeronautical Laboratory
AFWARNS	Air Force Warning System
AFWCCS	Air Force Wing Command and Control System
AFWL	Air Force Weapons Laboratory
AG	(1) Adjutant General; (2) Miscellaneous Auxiliary Ship
AGARD	Advisory Group for Aerospace Research and Development (NATO)
AGB	Icebreaker
AGC	Automatic Gain Control
AGCCS	Army's Global Command and Control System
AGDS	Deep Submergence Support Ship
AGE	Experimental Auxiliary
AGEF	Frigate Research Ship
AGEH	Experimental Auxiliary (Hydrofoil)
AGER	Intelligence Research Ship
AGES	Advanced Ground Exploitation System
AGF	Miscellaneous Command Ship
AGHS	Patrol Combatant Support Ship
AGI	Intelligence Collection Ship
AGL	(1) Buoy Tender; (2) Above Ground Level
AGM	(1) Air-to-Ground Missile; (2) Missile Range Instrumentation Ship
AGMR	Major Communications Relay Ship

Page 3277 of 3957

AGMS	Armored Ground Mobility System
AGOR	Oceanographic Research Ship
AGOS	(1) Ocean Surveillance Ship; (2) Air-Ground Operations School (NATO); (3) Air-Ground Operations System
AGP	Patrol Craft Tender
AGR	Army Guard Reserve
AGS	(1) Hydrographic Survey Ship; (2) FSU Automatic Grenade Launcher
AGT	Agent
AGZ	Actual Ground Zero
AH	(1) Hospital Ship; (2) Alternate Headquarters
AHFEWS	Army High Frequency Electronic Warfare System
AI	(1) Airborne Intercept; (2) Air Intelligence; (3) Artificial Intelligence; (4) Air Interdiction; (5) Airborne Interceptors; (6) Area of Interest; (7) All-Source Intelligence
A3I	Accelerated Architecture Acquisition Initiative
AIA	(1) Army Intelligence Agency; (2) ACE Intelligence Architecture; (3) ACE Interface Architecture; (4) Air Intelligence Agency
AIAA	American Institute of Aeronautics and Astronautics
AIA/IRD	Air Intelligence Agency/Intelligence Reserve Detachment
AIAWS	Automated Intelligence Analyst Workstation
AIB	Atlantic Intelligence Board
AIC	(1) Atlantic Intelligence Command; (2) Afloat Intelligence Center
AICBM	Anti-Intercontinental Ballistic Missile
AID	(1) U.S. Agency for International Development; (2) Aerospace Information Digest; (3) Army Information Digest; (4) Accident, Incident, Deficiencies; (5) Active Integral Defense
AIDES	(1) Analyst Intelligence Information Display and Exploitation System; (2) Automated Intelligence Display and Exploitation System
AIDS	(1) Acoustic Intelligence Data System; (2) Advanced Identification System; (3) Acquired Immune Deficiency Syndrome
AIF	(1) Automated Installations Intelligence File; (2) Army Industrial Fund; (3) Airfield Installation File; (4) Air Intelligence Flight; (5) Automated Installation File
AIFV	Armored Infantry Fighting Vehicle
AIG	(1) Address Indicator Group; (2) Air Intelligence Group
AIIC	Advanced Imagery Interpretation Course
AIIF	Automated Installation Intelligence File
AIIRS	Automated Intelligence Information Retrieval System
AIM	(1) Air Intercept Missile; (2) Active Inert Missile; (3) ADCOM Intelligence Memorandum
AIMD	Aircraft Intermediate Maintenance Department
AIMP	(1) Army Intelligence Management Plan; (2) Army Intelligence Master Plan; (3) Advanced Imagery Management Program; (4) Automated Information Management Program

Page 3278 of 3957

AIMTB	Artificial Intelligence Module Testbed
AIN	Advanced Intelligence Network
AIO	Air Intelligence Officer
AIOEC	Association of Iron Ore Exporting Countries
AIP	(1) Architecture Implementation Plan; (2) Anti-Surface-Warfare Improvement Program
AIPR	Automated Information Processing Request
AIR	American Institute for Research
AIRA	Air Attache
AIRCENT	(1) Air Forces Central Region (NATO); (2) Allied Air Forces Central Europe
AIRCOM	Air Command
AIRCOMTERM	Airborne Communications Terminal
AIRES	Advanced Imagery Requirements and Exploitation System
AIRES II	Airborne Reconnaissance Electronic System II
AIREW	Airborne Infrared Early Warning
AIRK	Area Interswitch Rekeying Key
AIRLO	Air Liaison Officer
AIRREQRECON	Air Request Reconnaissance
AIR	(1) Replenishment Oiler; (2) American Institute of Research
AIRS	(1) Advanced Inertial Reference Sphere; (2) Automated Information Retrieval Systems
AIRTAPS	Aerial Imagery Reconnaissance Tracking and Plotting System
AIS	(1) Automated Indicator System; (2) Advanced Indications Structure; (3) Advanced Indications System; (4) Army Intelligence Survey; (5) Automated Information System; (6) Air Intelligence Squadron
AISA	Automated Intelligence Support Activity
AISS	Automated Information Systems Security
AIST	Air Intelligence Support Team
AITE	Advanced Indications Technology Experiment
AIU	Army Interrogation Unit
AIWO	Air Intelligence Warning Officer
AIWS	Advanced Interdiction Weapon System
AJ	Antijamming
AJCC	Alternate Joint Communications Center
AJFP	Adaptive Joint Force Package
AJNPE	Airborne Joint Nuclear Planning Element
A/JSIC	Alternate JSIC
AK	(1) Cargo Ship; (2) FSU Kalashnikov Family of Assault Rifles; (3) Automatic Remote Rekeying
AKA	Also Known As
AKDC	Automatic Key Distribution Center
AKD/RCU	Automatic Key Distribution/Rekeying Control Unit
AKL	Light Cargo Ship
AKM	(1) Apogee Kick Motor; (2) AK-47 Assault Rifle
AKMC	Automated Key Management Center

Page 3279 of 3957

AKMS	Automated Key Management System
AKR	Vehicle Cargo Ship
AKTCAE	Army Korea Technical Control And Analysis Element
ALAIRCOM	Alaskan Air Command
ALARM	Alert, Locate and Report Missiles
ALASAT	Air-Launched Antisatellite
ALASCOM	Alaskan Communications Inc.
ALB	Air-Land Battle Doctrine (FM 100-5)
ALBM	Air-Launched Ballistic Missile
ALC	Accounting Legend Code
ALCATS	Automated Lines of Communication and Target System
ALCC	Airlift Control Center
ALCE	Airlift Control Element
ALCM	Air-Launched Cruise Missile
ALCOM	Alaskan Command
ALCOP	Alternate Command Post
ALCOR	ARPA Lincoln C-Band Observable Radar
ALCS	Airborne Launch Control System
ALD	Airlift Division
ALE	(1) AIRES Lifecycle Extension; (2) Automated Link Establishment
ALERT	Attack and Launch Early Report to Theater (AF)
ALES	AIRES Life Extension System
ALF	Auxiliary Landing Field
ALFA	Advanced Liaison Forward Area
ALL	Airborne Laser Laboratory
ALMS	Automated Logistics Management System
ALO	(1) Air Liaison Officer; (2) Authorized Level of Organization
ALOC(S)	Air Line(s) of Communication
ALPS	Accidental Launch Protection System
ALRAAM	Air-Launched Long-Range Air-to-Air Missile
ALRP-S	Army Long-Range Plan for Space
ALRPG	Army Long-Range Planning Guidance
ALS	(1) Active Laser Seeker; (2) Airborne Link Segment
ALSA	Air-Land-Sea Application (Center)
ALSS	Advanced Location Strike System
ALT	(1) Alternate; (2) Altitude
ALTAlR	ARPA Long-Range Tracking and Instrumentation Radar
ALTREV	Altitude Reservation
ALUSNA	American Legation U.S. Naval Attache
ALUSNLO	American Legation U.S. Naval Liaison Officer
ALWT	Advanced Lightweight Torpedo
ALWTIC	Annual Land Warfare Technical Intelligence Conference

Page 3280 of 3957

AM	(1) Ante Meridian (Before Noon); (2) Amplitude Modulation; (3) Asset Manager; (4) Aerographers Mate
AMAB	Air Mobile Assault Brigade
AMASS	(1) Advanced Marine Airborne SlGlNT System; (2) Advanced Marine Air Support System
AMBISS	Automated Map-Based Intelligence Support System
AMC	(1) Airspace Management and Control; (2) Army Materiel Command (Formerly DARCOM); (3) Air Mobility Command; (4) Air Mission Commander
AMCC	(1) Ashore Mobile Contingency Communications; (2) Ashore Mobile Command Center
AMC/IN	AMC Deputy Chief of Staff for Intelligence
AMCIT	American Citizen
AMCM	Airborne Mine Countermeasures
AMD	Activated Metal Decoy
AMDT	AEELS Mobile Downlink Terminal
AME	Airspace Management Element
AMEMB	American Embassy
AMETS	Artillery Meteorological System
AMF	Allied Command Europe Mobile Force (NATO)
AMH	Automated Message Handling
AMHA	Army Management Headquarters Activity
AMHS	Automated Message Handling System
AMIDS	Airborne Mine Detection System
AMIM	Army Modernization Information Memorandum
AMIP	Army Model Improvement Plan
AMIRS	Army Multispectral Imagery Requirements Study
AMIS	Advanced Microwave Imaging Sensor
AMM	Army Modernization Memorandum
Ammo	Ammunition
AMMS	(1) Allowance Material Management System; (2) Acquisition Milestone Management System
AMOPES	Army Mobilization and Operations Planning and Execution System
AMOPS	Army Mobilization Operations and Planning System
AMOS	Air Force Maui Optical System
AMP	(1) Amplification; (2) Army Modernization Plan; (3) Acquisition Master Plan
AMPDS	Automated Message Processing Dissemination System
AMPE	Automated Message Processing Exchange
AMPHI	Aerial Mission Photographic Indoctrination
AMPHIB	Amphibious
AMPL	Amplitude
AMPS	(1) Automated Mission Planning System; (2) Automated Message Processing System; (3) Aim Point System
AMRAAM	Advanced Medium-Range Air-to-Air Missile

Page 3281 of 3957

AMRWS	Advanced Remote Miniaturized Weather Station
AMS	(1) Automated Message System; (2) Auto-Manual System; (3) Autonomous Message Switch; (4) Advanced Mapping Spectrometer
AMSAT	Amateur Radio Satellite
AMSC	Advanced Military Spaceflight Capability
AMS-H	Advanced Missile System Heavy
AMSSA	Assured Mission Support Space Architecture
AMST	Advanced Medium STOL Transport
AMT	ACTS Mobile Terminal
AMTF	Airmobile Task Force
AMTP	Army Mission Training Plan
AMU	Astronaut Maneuvering Unit
AMW	Amphibious Warfare
AN	(1) Net Tender; (2) Army/Navy
ANALIT	Analyst-to-Analyst Message Format
ANC	African National Congress
ANCC	(1) Ashore Navy Communications Capability; (2) Automated Network Control Center
ANDVT	Advanced Narrowband Digital Voice Terminal
ANEX	Analyst-to-Analyst Exchange Message Format
ANFO	Ammonium Nitrate Fuel Oil
ANG	Air National Guard
ANGB	Army National Guard Base
ANGLlCO	Air and Naval Gunfire Liaison Company
ANL	Net-Laying Ship
ANLYS	Analysis
ANMCC	Alternate National Military Command Center
ANMIC	Alternate National Military Intelligence Center
ANR	(1) Alaskan NORAD Region; (2) Active Noise Reduction
ANRPC	Association of Natural Rubber-Producing Countries
ANSI	American National Standards Institute
ANVIS	Aviator’s Night Vision Imaging System
AN/VRC	Army Navy Vehicle Radio Communications
ANZUS	Australia, New Zealand, United States
AO	(1) Action Officer; (2) Oiler; (3) Authenticator Organization; (4) Area of Operations; (5) Aerial Observer
AOA	(1) Amphibious Objective Area; (2) Angle of Attack; (3) Angle of Arrival; (4) Airborne Optical Adjunct
AOB	(1) Air Order of Battle; (2) Advanced Operational Base
AOBTS	Air Order of Battle Textual Summary
AOC	(1) Air Officer Commanding (U.K.); (2) Air Operations Center; (3) Army Operations Center
AOCC	Area Operations Control Center
AOCS	Aviation Officers Candidate School
AOE	Fast Combat Support Ship
AOFDA	U.S. AID Office for Foreign Disaster Assistance

Page 3282 of 3957

AOG	Gasoline Tanker
AOI	(1) Area of Influence; (2) Area of Interest
AOIC	Assistant Officer in Charge
AOIR	(1) ACE Operational Intelligence Requirements; (2) Area of Intelligence Responsibility
AOL	Area of Limitation
AO&M/NM	Administration, Operations, and Maintenance/Network Management
AOO	Air Operations Order
AOP	(1) Area of Probability; (2) Air Operations Plan
AOR	Area of Responsibility
AOS	(1) Special Liquids Tanker; (2) Amphibious Objective Study; (3) Area of Separation
AOSG	Amphibious Operation Support Graphic
AOSS	Automated Office Support System
AOT	Transport Oiler
AOTF	Acoustic-Optic Tunable Filter
AP	(1) Armor-Piercing; (2) Air Police; (3) Transport Ship; (4) Associated Press; (5) Ammonium Perchlorate; (6) Antipersonnel; (7) Application Processor
AP-I	Armor Piercing Incendiary
APB	(1) Self-Propelled Barracks Ship; (2) All Points Bulletin; (3) Antipersonnel Bomb; (4) Acquisition Program Baseline
APC	(1) Armored Personnel Carrier; (2) Area of Positive Control; (3) Adaptive Predictive Coding
APCC	Alternate Processing and Correlation Center
APFSDS	Armor-Piercing, Fin-Stabilized, Discarding Sabot
APHIS	USDA Animal and Plant Health Inspection Service
APL	(1) Barracks Craft (non self-propelled); (2) Applied Physics Laboratory (Johns Hopkins University)
APM	Army Program Memorandum
APMS	(1) Automated Production Management System; (2) Advanced Precision Measurement System
APO	(1) Army Post Office; (2) Air Post Office
APOD	Aerial Port of Debarkation
APOE	Aerial Port of Embarkation
APORTS	Aerial Ports File (JOPES)
APP	Application
APPS	Applications
Appl	Application
Approx	Approximately
APPS	Analytical Photogrammetric Position System
APS	(1) ASARS-II Processing Segment; (2) Air Planning System
APT	(1) Automatic Picture Transmission; (2) Airport
APU	Auxiliary Power Unit
APVO	FSU Air Defense Aviation
APW	American Prisoner of War

Page 3283 of 3957

AQF	Advanced QUICKFIX
AR	(1) Advanced Readiness; (2) Army Regulation; (3) Action Required; (4) Repair Ship; (5) Agent Report; (6) Army Reserve; (7) Army
ARABSAT	Arab Satellite (Communications Organization)
ARB	Battle Damage Repair Ship
ARC	(1) Cable Ship; (2) Acquisition Review Committee; (3) Armored Reconnaissance Carrier; (4) Air Reserve Component
ARCENT	U.S. Army Forces Central Command
ARCENT-K	USACENT forward element-Kuwait
ARCENT-SA	USACENT forward element-Saudi Arabia
ARCH	Architecture
ARCOM	Army Command
ARDC	Air Research and Development Command
AREC	Air Element Coordinator
ARCS	(1) Automated Reproduction and Collating System; (2) Acquisition Radar and Control System
ARD	Auxiliary Repair Drydock
ARDF	Airborne Radio Direction Finding
ARDM	Auxiliary Repair Drydock
AREPT	Agent Report
ARF	Airborne Relay Facility
ARFCOS	Armed Forces Courier Service
ARFOR	Army Force(s)
ARG	(1) Amphibious Readiness Group; (2) Internal Combustion Engine Repair Ship
ARIS	Advanced Range Instrumentation Ship
ARL	(1) Landing Craft Repair Ship; (2) Airborne Reconnaissance Low; (3) Army Research Lab; (4) Aerial Reconnaissance Liaison
ARL-I	Airborne Reconnaissance Low-Imagery
ARLANT	U.S. Army Forces, LANTCOM
ARLEA	Army Logistics Evaluation Agency
ARLO	Air Reconnaissance Liaison Officer
ARM	(1) Antiradiation Missile; (2) Atmospheric Radiation Measurement
ARMA	Army Attache
ARMISE	Army Reserve Military Intelligence Support Element
ARMLO	Army Liaison Officer
ARMS	Automated Resource Management System
ARNG	Army National Guard
ARO	(1) Area Records Officer; (2) Auxiliary Readout
ARP	Alert Response Plan
ARPA	Advanced Research Projects Agency
ARPAC	Army Pacific
ARPANET	Advanced Research Projects Agency Network
ARPS	Advanced Radar Processing System

Page 3284 of 3957

ARPV	Advanced Remotely Piloted Vehicle
ARR	Radiological Repair Ship
ARRC	(1) ACE Rapid Reaction Corps; (2) Allied Rapid Reaction Corps
ARRN	Andean Ridge Radar Network
ARRS	Aerospace Rescue and Recovery Service
ARS	(1) Salvage and Rescue Ship; (2) Aerial Reconnaissance and Surveillance; (3) Airborne Receiver System; (4) Air Rescue Service
ARSA	(1) Annual Reevaluation of Safe Areas; (2) Airborne Reconnaissance and Surveillance Architecture
ARSGS	Airborne Reconnaissance SIGINT Ground Systems
ARSO	Assistant Regional Security Officer
ARSOA	Army Special Operations Aviation
ARSOC	Army Special Operations Command
ARSOF	Army Special Operations Forces
ARSOFE	Army Special Operations Forces, Europe
ARSOFSUPCOM	Army Special Operations Forces Support Command
ARSOTF	Army Special Operations Task Force
ARSP	Advanced Reconnaissance Support Program
ARSPACE	Army Space Command
ARSPACECOM	Army Space Command
ARSPOC	Army Space Operations Center
ARSST	Army Space Command Space Support Team
ARSTAF	Army Staff
ART	(1) Aerial Reconnaissance Team; (2) Amateur Radio Transceiver
ARTADS	Army Tactical Data System
ARTAS-K	Army Training and Support-Kuwait (former name for ARCENT-K)
ARTBASS	Army Training Battle Simulation Systems
ARTCC	Air Route Traffic and Control Center
ARTEP	(1) Army Readiness Training Evaluation Program; (2) Army Training and Evaluation Program
ARTISS	Advanced Requirements Tasking Information and Support System
ARTPP	Airborne Reconnaissance Technology Program Plan
ARTS	Automated Remote Tracking Station
ARTY	Artillery
ARV	(1) Armored Recovery Vehicle; (2) Armored Reconnaissance Vehicle; (3) Aircraft Repair Ship
ARW	Air Refueling Wing

Page 3285 of 3957

AS	(1) Submarine Tender; (2) Air Surveillance; (3) Analysis Sub-system; (4) Air Station; (5) Anti Spoofing; (6) Advanced Sensors
ASA	Army Space Agency
ASA	(M&RA)Assistant Secretary of the Army (Manpower and Reserve Affairs)
ASAB	All-Source Analysis Branch
ASAC	All-Source Analysis Center
ASAP	(1) As Soon As Possible; (2) Advanced Sensor Applications Program
ASAR	Advanced Synthetic Aperture Radar
ASARC	Army Systems Acquisition Review Council
ASARS	Advanced Synthetic Aperture Radar System
ASART	(1) AEELS Support Analysis Reporting Terminal; (2) Analysis Support and Reporting Terminal
ASAS	All-Source Analysis System
ASAS-AS	All-Source Analysis System All-Source Workstation
ASAS-E	All-Source Analysis System-Extended
ASAS-SS	All-Source Analysis System Single-Source Workstation
ASAS-W	All-Source Analysis System WARRIOR
ASAT	(1) Antisatellite; (2) Antisatellite Treaty; (3) Advance Satellite Antenna Technology
ASB	(1) Air Surveillance Broadcast; (2) Army Science Board
ASC	(1) AUTODlN Switching Center; (2) Army Service Component; (3) Army Space Command; (4) Advanced Systems Course
ASCAMP	Advanced Single-Channel Manpack
ASCII	American Standard Code for Information Interchange
ASCC	(1) Air Standardization Coordinating Committee; (2) Alternate Space Control Center
ASCII	American National Standard Code for Information Interchange
ASCM	Antiship Cruise Missile
ASCON	Automatic Switched Communications Network
ASD	Assistant Secretary of Defense
ASD (C3I)	Assistant Secretary of Defense (Command, Control, Communications, and Intelligence)
ASD (C4I)	Assistant Secretary of Defense (Command, Control, Communications, Computers and Intelligence)
ASD (ISA)	Assistant Secretary of Defense for International Security Affairs
ASD (S&R)	Assistant Secretary of Defense for Strategy and Requirements
ASD (SO/LIC)	Assistant Secretary of Defense for Special Operations and Low Intensity Conflict
ASDC	Advanced Space Data Corporation
ASDEP	Army Space Exploitation Demonstration Programs
ASDIA	All-Source Document Index
ASDIAZ	All-Source Document Index Automated File-Compartmented
ASDIAZO	All-Source Document Index Automated File-ORCON
ASDIC	Armed Services Documents Intelligence Center

BGN	Board on Geographic Names
BGPHES	Battle Group Passive Horizon Extension System
BGW	Battlefield Guided Weapon
BGWU	Battle Group Workup
BH	Busy Hour
B-H	Bosnia-Hercegovina
BI	Background Investigation
BIACC	Basic Integrated Aircraft Command and Control
BIC	Battlefield Information Center
BICC	Battlefield Information Coordination Center
BICES	Battlefield Information Collection and Exploitation Systems (NATO)
BICM	Battlefield Intelligence Collection Model
BIDS	Battlefield Information Distribution System
BIF	Basic Imagery File

BIFF	Bistatic Identification Friend or Foe
BIIB	Basic Imagery Interpretation Brief
BIIR	Basic Imagery Interpretation Report
BIM	Ballistic Intercept Missile
BIOLDEF	Biological Defense
BIOLOPS	Biological Operations
BIOLWPN	Biological Weapons
BISS	Baseline Intelligence Summary Supplement
BIT	Binary Digit
BITE	Built-In Test Equipment
BITS	Base Information Transfer System
BIU	Bus Interface Unit
Bks	Barracks
BKS	Broadcast Keying Station
BL	Bomb Line
BLDG	Building
BLEST	Berm-Loaded Explosive Simulation Technique
BLEU	Belgium-Luxembourg Economic Union
BLIP	Background Limited IR Photography
BLOS	Beyond Line-of-Sight
BLSS	Base Level Self-Sufficiency Spares
BLT	Battalion Landing Team
BLUE FLAG	ACC command and control exercise
BM	(1) FSU Truck-Mounted Multiple Rocket Launcher; (2) Ballistic Missile
BMATT	Briefcase Multi-Mission Advanced Tactical Terminal
BM/C2	Battle Management/Command and Control
BM/C3	Battle Management/Command, Control, and Communications
BMC	Battle Management Cell
BMCT	Beginning of Morning Civil Twilight
BMD	(1) Ballistic Missile Defense; (2) FSU Airborne Combat Vehicle
BMDO	(1) Ballistic Missile Defense Organization; (2) Ballistic Missile Defense Office
BMDSCOM	U.S. Army Ballistic Missile Defense Systems Command
BMEWS	Ballistic Missile Early Warning System
BMG	Basic Mission Guidance
BMNT	Beginning of Morning Nautical Twilight
BMP	FSU Armored Infantry Combat Vehicle
BMSS	Ballistic Missile Systems Subcommittee
BN/Bn	Battalion
BND	Bundesrepublik Nachrichtendienst (German Intelligence Service)
BOA	Broad Ocean Area
BOCCA	Board for Coordination of Civil Aircraft (NATO)
BOIP	Basis of Issue Plan

Page 3294 of 3957

BOMREP	Bombing Report
BOQ	Bachelor Officers' Quarters
BOS	(1) Battlefield Operating System; (2) Base Operating Support
BP	(1) Battle Position; (2) Bandpass
BPA	(1) Battlefield Psychological Activities; (2) Blanket Purchase Agreement
BPE	Beacon Precision Enlarger
BPF	Bandpass Filter
BPI	Bits Per Inch
BPPBS	Biennial Planning, Programming, and Budgeting System
BPR	Business Process Reengineering
BPS	(1) Basic Psychological Operations Study; (2) Bits Per Second; (3) Beachman Processing System
BPSK	Burst Pulse Shift Key
BR	Blade Rate
B/R	Bridge/Router
BR/Br	Branch
BRAC	Base Realignment and Closure (Commission)
BRDM	FSU Wheeled Amphibious Armored Reconnaissance Vehicle
BRET	Bistatic Reflected Energy Target
BRI	Basic Rate Interface
BRIXMIS	British Commanders-In-Chief Military Liaison Mission
BRL	Bomb Release Line
BRP	Bomb Release Point
BRS	(1) Beachman Reporting System; (2) Backup and Recovery System (3) Beach Reconnaissance System
BRU	Bomb Release Unit
BS	Broadcast Service
BSA	Brigade Support Area
BSD	(1) Battlefield Surveillance Device; (2) Battlefield Surveillance Display
BSS	Broadcast Satellite Service
BSSC	Battle Staff Support Center
BSSG	Brigade Service Support Group
BST	(1) Battle Staff Team; (2) Betac Support Team
BSTS	(1) Boost Surveillance and Tracking System; (2) Boost Phase Surveillance and Tracking System
BT	Basic Training
BTA	Best Technical Approach
BTF	Battalion Task Force
BTG	Basic Target Graphic
BTI	Balanced Technology Initiative
BTR	FSU Armored Personnel Carrier
BTRY	(1) Battery; (2) Field Artillery
BTU	British Thermal Unit
BTW	By The Way

Page 3295 of 3957

BUD/S	Basic Underwater Demolition/Sea-Air-Land (SEAL)
BUIC	Back-Up Intercept Control
BUNT	British Underground Nuclear Test
BUR	Bottom Up Review
BVITS	Baseline Video Imagery Transmission System
BVR	Beyond Visual Range
BW	(1) Biological Warfare; (2) Bandwidth; (3) Beamwidth; (4) Bomb Wing
B&W	Black and White
BWC	Biological Weapons Convention
BWP	Basic Working Paper
BZ	Buffer Zone

Page 3296 of 3957

C

C	(1) Crisis; (2) Confidential; (3) Coniferous
C1	Combined Staff Personnel Officer
C2	(1) Command and Control; (2) Combined or Coalition Forces Intelligence Staff
C2S2LAN	Command and Control Support System LAN
C2W	Command & Control Warfare
C3	Command, Control, and Communications
C3OB	C3 Order of Battle
C3S	Command, Control, and Communications Systems
C4	Command, Control, Communications, and Computers
C4ISR	Command, Control, Communications, Computers, Intelligence, Surveillance and Reconnaissance
C4S	Command, Control, Communications, and Computer System
C5	Combined Staff Strategic Planning and Policy Officer
C6	Combined Staff Command, Control and Communications Systems Officer
CA	(1) Cryptanalysis; (2) Heavy Cruiser; (3) Civil Affairs; (4) Combat Assessment; (5) Controlling Authority; (6) COMSEC Account; (7) Command Authority; (8) Counterair
CAA	(1) Concepts Analysis Agency (U.S. Army); (2) Combined Arms Army (FSU); (3) Command Arrangement Agreement
CAB	(1) Current Analysis Branch; (2) Civil Affairs Brigade; (3) Civil Affairs Battalion
CAC	(1) Combined Arms Center; (2) Collection Advisory Center; (3) Control and Analysis Center; (4) Crisis Action Center; (5) Civil Affairs Command; (6) Civil Applications Committee; (7) U.S. Army Combined Arms Command
CACDA	Combined Arms Combat Development Activity
CACM	Central American Common Market
CACTIS	Community/Computer Automated Counterterrorism Intelligence System
CAD	(1) Computer-Assisted Design; (2) Conceptual Architecture Document
CADES	COMIREX Advanced Exploitation System
CADIZ	(1) Canadian Air Defense Identification Zone; (2) Coastal Air Defense Identification Zone
CADOB	Consolidated Air Defense Order of Battle
CADS	Containerized Ammunition Distribution System
CADST	Civil Affairs Direct Support Team
CAE	Computer Aided Engineering
CAF	(1) Crisis Augmentation Facility; (2) Combat Air Forces
CAFMS	Computer-Assisted Force Management System
CAG	(1) Carrier Air Group; (2) Collective Address Group; (3) Commander, Air Group
CAI	Computer-Aided Instruction
CAIF	Command Automated Intelligence File

Page 3297 of 3957

CAIMS	Conventional Ammunition Information Management System
CAJIT	Central America Joint Intelligence Team
CaLANdar	Da Vinci E-Mail Application
CALS	Computer-Aided Acquisition and Logistics Support
CALT	Civil Affairs Liaison Team
CAM	(1) Computer-Assisted Modeling; (2) Computer Aided Manufacturing
CAMO	Computer-Aided Manual Operation
CAMPS	(1) Computer-Aided Management Planning System; (2) Computer-Aided Mission Planning System; (3) Compartmented All-Source Analysis System Message Processing System
CAMS	(1) COMIREX Automated Management System; (2) Communications Area Master Station
CANDOB	Consolidated Aerospace Defense Order of Battle
CANR	Canadian NORAD Region
CAN	Coastal Air Navigation Supplement
CANT	Chinese Atmospheric Nuclear Test
CANUK	US Canada, United Kingdom, United States
CANUS	Canadian - United States
CANUS LANDOP	Canada-United States Land Operations Plan
CAO	(1) Crisis Action Organization; (2) Chief Administrative Officer; (3) Central Action Office
CAO(SOP)	Coordination of Atomic Operations (Standard Operating Procedure)
CAOC	Combined Air Operations Center
CAOCC	Combined Air Operations Coordination Center
CAP	(1) Combat Air Patrol; (2) Civil Air Patrol; (3) Countermeasures Advisory Panel; (4) Crisis Action Planning; (5) Crisis Action Procedures; (6) Capabilities
CAPSULE JACK	Proper Name of System
CAR	(1) Canadian Airborne Regiment; (2) Chief, Army Reserve
CARC	Corrective Action Review Committee
CARDA	(1) Continental Airborne Reconnaissance for Damage Assessment; (2) CONUS Airborne Reconnaissance for Damage Assessment
CARE	Cooperative for American Relief Everywhere, Inc.
CARG	Crisis Action Review Group
CARGRU	Carrier Group
CARIBJIC	Caribbean Joint Intelligence Center
CARIBROC	Caribbean Regional Operations Center
CARICOM	Caribbean Common Market
CARIFTA	Caribbean Free Trade Association
CARL	Category Assignment Responsibility List
CARP	Computed Air Release Point
CARS	(1) Contingency Airborne Reconnaissance System; (2) Common Automated Recovery System

Page 3298 of 3957

CARVE	Criticality, Accessibility, Recuperability, Vulnerability, and Effect
CARVER	Criticality, Accessibility, Recuperability, Vulnerability, Effects and Recognizability
CAS	(1) Close Air Support; (2) Calibrated Air Speed; (3) Collision Avoidance System; (4) Crisis Action System; (5) Crisis Action Staff; (6) Combined Arms and Services Staff School
CASC	Crisis Action Support Cell
CASE	Computer-Assisted Software Engineering
CASIC	Combined All-Source Intelligence Center
CASLAN	Command Automated Software Local Area Network
CASS	(1) Collection Analysis Support Subsystem; (2) Command Activated Sonobuoy System
CAST	(1) Catalogue of Approved Scientific and Technical Intelligence Tasks; (2) Canadian Air/Sea Transport Group; (3) Computer-Assisted Self Training; (4) Computer Assisted Satellite Track
CAT	(1) Conventional Arms Transfer; (2) Crisis Action Team; (3) Combined Arms Team; (4) Crisis Augmentation Team; (5) Category
CAT-1	RECategory-1 Receive Equipment
CATF	(1) Commander, Amphibious Task Force; (2) Civil Affairs Task Force
CATIS	(1) Computer-Aided Tactical Information System; (2) Computer-Aided Tactical Intelligence System
CATIS/IESS	Computer-Aided Tactical Information System/Imagery Exploitation Support System
CATS	(1) Combined Arms Training Systems; (2) Combat Airlift Tactics' School
CATSS	Cartographic Applications for Tactical and Strategic Systems
CAV	Cavalry
CAVU	Ceiling And Visibility Unlimited
CAWS	Commercial Analyst Work Station
CB	Chemical, Biological
C-band	3.9 to 6.2 GHz Communications Band
CBD	Commerce Business Daily
CBF	Common Budget Framework
CBI	(1) Complete Background Investigation; (2) Computer Based Instruction
CBI/T	Computer-Based Instruction/Training
CBJB	Congressional Budget Justification Book
CBM	Confidence Building Measure(s)
CBO	Congressional Budget Office
CBR	(1) Chemical, Biological, and Radiological; (2) Case Based Reasoning; (3) Constant Bit Rate
CBRN	Caribbean Basin Radar Network
CBRS	Concept Based Requirements System
CBS	Combat Battle Simulation
CBT	(1) Computer-Based Training; (2) Combating Terrorism

Page 3299 of 3957

CBTDEV	Combat Developer
CBTI	Combat Intelligence
CBU	Cluster Bomb Unit
CBW	Chemical and Biological Warfare
CBZ	Confidence Building Zone
CC	(1) Command Center; (2) Command Ship; (3) Cloud Cover; (4) Collection Center; (5) Computer Compatible; (6) Communications Controller; (7) Commander
C-C3	Counter Command, Control, and Communications
CCA	Communications Control Authority
CCB	Configuration Control Board
CCC	(1) CARDA Control Center; (2) Consolidated Command Center; (3) Command and Control Center
CCD	(1) Conference of the Committee on Disarmament; (2) Charged Coupled Device; (3) Camouflage, Concealment, and Deception
CCE	Contingency Communications Element
CCEB	Combined Communications Electronic Board
CCEP	Commercial COMSEC Endorsement Program
CCF	Collection Coordination Facility
CCF-SS	Collection Coordination Facility-Support System
CCG	(1) Combat Control Group; (2) Crisis Coordination Group; (3) Combat Communications Group
CCG-NB	Communications Control Ground-Narrowband
CCGD	Commander, Coast Guard District
CCGP	Combat Communications Group
CCHC	Headquarters Commandant
CCI	Controlled Cryptographic Item
CCIC	Concentrated Counterdrugs Intelligence Collection
CCIP	Command Center Improvement Program
CCIR	International Radio Consultative Committee (French Acronym)
CCIRID	Charge-Coupled Infrared Imaging Device
CCIRM	Collection Coordination and Intelligence Requirements Management
CCIS	(1) Command, Control, and Intelligence Support; (2) Common Channel Intelligence Signaling
CCISCMO	Community Counterintelligence and Security Countermeasures Office
CCISS	Command & Control Intelligence Support Squadron
CCITT	Consultative Committee for International Telephone and Telegraph
CCJ1	USCENTCOM Manpower, Personnel, and Administration Directorate
CCJ2	USCENTCOM Intelligence Directorate
CCJ3	USCENTCOM Operations Directorate
CCJ4/J7	USCENTCOM Logistics and Security Assistance Directorate
CCJ5	USCENTCOM Plans and Policy Directorate

Page 3300 of 3957

CCJ6	USCENTCOM Command, Control, Communications, and Computer Systems Directorate
CCJA	USCENTCOM Staff Judge Advocate
CCM	(1) Cross-Country Movement; (2) Counter-Countermeasure
C3CM	Command, Control, and Communications Countermeasures
CCMF	Consolidated Collection Management Facility
CCN	Crisis Communications Network (CIA)
CCO	(1) Communication Collection Outstation; (2) COMINT Collection Outstation; (3) Circuit Control Officer; (4) Chief, Combat Operations
CCO/SCO	Central Control Office/Sub-Control Office
CCP	(1) Consolidated Cryptologic Program; (2) Communications Checkpoint; (3) Contingency Communications Package
CCPC	Critical Collection Problems Committee
CCPDS	Command Center Processing and Display System
CCPDS-R	Command Center Processing and Display System Replacement
CCS	(1) Collection Capabilities Statement (HUMINT); (2) COMINT Collection Subsystem (3) Combat Control Squadron; (4) Communications Control Set; (5) Command and Control Systems; (6) Constellation Control Station
CCS2	Command and Control Subordinate System
CCSA	USCENTCOM Scientific and Technical Advisor
CCSC	Cryptologic Combat Support Console
CCT	(1) Combat Control Team; (2) Combat Coordination Team
CCTC	Command and Control Technical Center
CCTF	(1) Contingency Communications Test Facility; (2) Combined Coalition Task Force
CCTP	Continuously Computed Target Point
CCTS	Combat Crew Training Squadron
CCTT	Close Combat Tactical Trainer
CCTV	Closed Circuit Television
CCTW	Combat Control Training Wing
CCWT	Command Center Watch Team
CD	(1) Controlled Dissemination; (2) Certificate of Destruction; (3) Civil Defense; (4) Coastal Defense; (5) Calendar Day; (6) Committee on Disarmament; (7) Collateral Damage; (8) Compact Disc; (9) Command Ship; (10) Counter Drug; (11) Command Director; (12) Combat Developments; (13) Community/Service-Developed
C&D	Cover and Deception
CDA	Congressionally Directed Action
CDC	(1) Career Development Course; (2) Combat Direction Center; (3) Combat Development Center
CD-ROM	Compact Disk-Read-Only Memory
CDAS	Central Data and Applications Support
C-Day	Day in Which Movement From Origin Begins
CDB	Central Data Base
CDCS	Communications Distribution Control Segment

Page 3301 of 3957

CDE	(1) Conference on Disarmament in Europe; (2) Compound Damage Expectancy; (3) Center of Distance Education
CDEC	Captured Document Exploitation Center
CDF	Central Document File
CDI	Compact Disc Interactive
CDIP	(1) Consolidated Defense Intelligence Program; (2) Council of Defense Intelligence Producers
CDIS	(1) Communications Data Interface System; (2) Counterdrug Intelligence System
CDIST	Canadian Department of Industry, Science, and Technology
CDL	Common (high bandwidth) Data Link
CDLF	Consolidated Domestic Launch Forecast
CDM	Common Digital Map
CDMA	Code Division Multiple Access
CDP	(1) Central Data Processor; (2) Company Distributing Point
CDPS	Coherent Data Processing System
CDR	(1) Critical Design Review; (2) Commander
CDRL	Contract Data Requirements List
CDRUSAJFKSWC	Commander, United States Army John F. Kennedy Special Warfare Center
CDRUSELEMNORAD	Commander, U.S. Element NORAD
CDRWESTCOM	Commander, U.S. Army Western Command
CDS	(1) Chief of Defence Staff (Canadian); (2) Combat Delivery System; (3) Cryptographic Device Services; (4) Combat Direction System
CDSE	Cryptologic Direct Support Element
CDSORG	Civil Direction of Shipping Organization
CDST	C3CM Data Support Team
CDT	(1) Central Daylight Time; (2) Communications Data Terminal
CDTS	Computer-Directed Training System
CDU	Control Display Unit
CDV	Compressed Digital Video
CE	(1) Circular Error; (2) Cost Effectiveness; (3) Civil Engineer; (4) Communications-Electronics; (5) Corps of Engineers (U.S. Army); (6) Current Exploitation; (7) Counterespionage; (8) Command Element; (9) Collection Emphasis
C&E	Collection and Exploitation
C-E	Communications Electronics
CEAO	West African Economic Community
CEC	(1) Cooperative Engagement Capability; (2) Consolidated Expenditure Center
CECOM	Communications and Electronics Command
CED	(1) Collection, Exploitation, and Dissemination; (2) Captured Enemy Document
CEE	Captured Enemy Equipment
CEI	Communications Electronic Instructions

CEOI	Communications Electronics Operations Instructions
CEP	(1) Circular Error Probable; (2) Construction Electrician (Power); (3) Common Electronic Parts; (4) Civil Emergency Planning; (5) Committee for Energy Policy of OECD; (6) Capital Equipment Plan; (7) Concept Evaluation Program
CEPG	Combined Exercise Planning Group
CEPIR	Current Exploitation Photographic Interpretation Report
CEPR	Compromising Emanation Performance Requirement
CER	(1) Cryptographic Equipment Room; (2) Communication Equipment Room
CERP	(1) Combined Economic Reporting Program; (2) Capital Equipment Replacement Program
CERT	Computer Security Emergency Response Team
CES	Concept Exploration Studies
CESM	Cryptologic Electronic Warfare Support Measures
CEST	Contingency Exploitation Support Team
CETA	Chinese-English Translation Assistance
CEWI	Combat Electronic Warfare Intelligence
CF	Canadian Forces
C6F	Commander, U.S. Sixth Fleet
C7F	Commander, U.S. Seventh Fleet
CFA	(1) Combined Field Army (Korea); (2) Covering Force Area; (3) Combined Force Air Component Commander
CFB	Canadian Forces Base
CFC	(1) Combined Field Command (Korea); (2) Combined Forces Command (ROK/US); (3) Combined Federal Campaign
CCFC	Commander in Chief, ROK-U.S. Combined Forces Command
CFD	Common Fill Device
CFE	(1) Conventional Forces Europe; (2) Communications Front-End
CFER	CFE Replacement
CFE-U	Communications Front-End-Upgrade
CFI&I	Center for Integration and Interoperability
CFIS	Combined Forces Command Information System, (CFC)

Page 3303 of 3957

CFL	(1) Coordinated Fire Line; (2) Cease-Fire Line
CFMS	Combat Fuels Management System
CFP	(1) Contingency Force Pool; (2) Concept Formulation Process
CFR	Commander Force Reconnaissance
CFSO	Counterintelligence Force Protection Source Operations
CFSR	Contract Funds Status Report
CFV	Cavalry Fighting Vehicle
cg	Center of Gravity
CG	(1) Guided-Missile Cruiser; (2) Consolidated Guidance; (3) Commanding General; (4) Coast Guard; (4) Chairman's Guidance
CGEUSA	Commanding General, 8th US Army
CGF	Central Group of Forces (FSU Forces in Czechoslovakia)
CGFMFLANT	Commanding General, Fleet Marine Forces Atlantic
CGM	Computer Graphics Metafile
CGN	Guided Missile Cruiser Nuclear Powered
CGS	(1) Coast & Geodetic Survey; (2) Common Ground Station; (3) CONUS Ground Station
CGSC	Command and General Staff College (U.S. Army)
CGUSARPAC	Commanding General U.S. Army Pacific
cGy/hr	CentiGray hour
CH	(1) Aviation Cruiser; (2) Channel; (3) Communication Helmet
CHAALS	Communications High Accuracy Airborne Location System
CHAALS-X	CHAALS Exploitation
CHABNCP	Chief, Airborne Command Post
CHAMPUS	Civilian Health And Medical Program of the Uniformed Services
CHARS	Characters
CHB	Cargo Handling Battalion
CHBDL	Communications High Bandwidth Data Link
CHCMSA	Chief, Cruise Missile Support Activity
CHCSS	(1) Chief, Central Security Service; (2) Chief, Cryptologic Support Service
CHG	Guided-Missile Aviation Cruiser
CHGN	Nuclear-Powered Guided-Missile Aviation Cruiser
CHIP	Communications Handbook for Intelligence Planners
CHJUSMAGK	Chief, Joint U.S. Military Assistance Group, Korea
CHJUSMAGPHIL	Chief, Joint U.S. Military Assistance Group, Philippines
CHJUSMAGTHAI	Chief, Joint U.S. Military Assistance Group, Thailand
CHMAAGDOMREP	Chief, Military Assistance and Advisory Group, Dominican Republic
CHMDO JAPAN	Chief, Military Defense Office, Japan
CHN	Nuclear-Powered Aviation Cruiser
CHODC INDIA	Chief, Office of Defense Cooperation, India
CHOP	(1) Change of Operational Command; (2) Change of Operational Control
C-HUMINT	Counter Human Resources Intelligence

Page 3304 of 3957

CHUSMLO	Chief, U.S. Military Liaison Office
CI	(1) Counterintelligence; (2) Counterinsurgency; (3) Current Intelligence
C2I	Command, Control, & Intelligence
C3I	Command, Control, Communications, and Intelligence
C4I	Command, Control, Communications, Computers, & Intelligence
C4I2	Command, Control, Communications, Computers, Intelligence and Information
CIA	Central Intelligence Agency
CIAC	Computer Incident Assessment Capability
CIAD	(1) Combat Intelligence Applications Division; (2) Command Intelligence Architecture Document
CIAP	(1) CIA Program; (2) Command Intelligence Architecture/Planning Program
CIARDSCIA	Retirement and Disability System
CIAS	Counterintelligence Analysis Section
CIB	Combat Infantryman's Badge
CIC	(1) Combat Information Center; (2) Combat Intelligence Center; (3) Combined Intelligence Center
C3IC	Coalition Coordination and Communications Integration Center
CICAC	Counterintelligence Control and Analysis Center
CICC	Consolidated Intelligence Communications Center
CIC Server	Combined Intelligence Center Server
CICWS	Combined Intelligence Center Workstation
CID	(1) Criminal Investigation Division; (2) Combat Intelligence Division
CIDBS	Combined Intelligence Center Integrated Database Server
CIDC	Combined Interview and Debriefing Center
CIE	Communication Intercept and Exploitation
CIEF	Consolidated Imagery Exploitation Facility
CIF	(1) Corps Interrogation Facility; (2) Consolidated Intelligence Facility
CIFAX	Enciphered Facsimile
C4IFTW	C4I For The Warrior
CIG	(1) Computer Image Generation; (2) Combined Intelligence Group
CIGSS	Common Imagery Ground Surface System
CIHS	Classified Information Handling System
CIK	Crypto-Ignition Key
CIIC	Current Intelligence and Indications Center
CIID	Command Intelligence Implementation Document
CILMS	Covert Infrared Lighting and Marking System
CILO	Counterintelligence Liaison Office(r)
CILOP	Conversion in Lieu of Procurement
CIM	Corporate Information Management
CIMAS	CENTCOM Iranian Military Activities Summary
CIMEX	Civil Military Exercise (NATO)

Page 3305 of 3957

C-IMINT	Counter Imagery Intelligence
CIMOC	Civil Military Operations Center
CIMP	COMSEC Interoperability Master Plan
CIN	Cargo Increment Number
CINC	(1) Commander in Chief; (2) Commander of a Combatant Command
CINCACOM	Commander in Chief, U.S. Atlantic Command
CINCAFLANT	Commander in Chief, United States Air Forces, Atlantic
CINCAL	Commander in Chief, Alaska
CINCARLANT	Commander in Chief, United States Army Forces, Atlantic
CINCCENT	Commander in Chief, Allied Forces Central Europe (NATO)
CINCCFC	Commander in Chief, Combined Forces Command, Korea
CINCEASTLANT	Commander in Chief, Eastern Atlantic (NATO)
CINCENT	Commander in Chief, Allied Forces, Central Europe
CINCEUR	Commander in Chief, U.S. Forces Europe
CINCFOR	Commander in Chief, Forces Command
CINCFORSCOM	Commander in Chief, U.S. Army Forces
CINCHAN	Commander in Chief, Channel (NATO)
CINCIBERLANT	Commander in Chief, Iberian Atlantic Area
CINCLANT	Commander in Chief, Atlantic Command
CINCLANTFLT	Commander in Chief, Atlantic Fleet
CINCLANTFLTDETSO	Commander in Chief, Atlantic Fleet Detachment SOUTHCOM
CINCMAC	Commander in Chief, Military Airlift Command (archaic)
CINCNORAD	Commander in Chief, North American Air Defense Command
CINCNORTH	Commander in Chief, Allied Forces Northern Europe (NATO)
CINCONAD	Commander in Chief, Continental Air Defense Command
CINCPAC	Commander in Chief, Pacific Command
CINCPACAF	Commander in Chief, Pacific Air Force
CINCPACFLT	Commander in Chief, Pacific Fleet
CINCPACREP	Commander in Chief, Pacific Representative
CINCSAC	Commander in Chief, Strategic Air Command
CINCSOC	Commander in Chief, Special Operations Command
CINCSO	Commander in Chief, Southern Command
CINCSOUTH	Commander in Chief, Allied Forces Southern Europe (NATO)
CINCSPACE	Commander in Chief, U.S. Space Command
CINCSPECOMME	Commander in Chief, Specified Command, Middle East
CINCTAC	Commander in Chief, Tactical Air Command
CINCTRANS	Commander in Chief, Unified Transportation Command
CINCTRANSCOM	Commander in Chief, U.S. Transportation Command
CINCUKAIR	Commander in Chief, United Kingdom Air Defense Region (NATO)
CINCUNC	Commander in Chief, United Nations Command
CINCUSACOM	Commander in Chief, U.S. Atlantic Command
CINCUSAFE	Commander in Chief, U.S. Air Forces, Europe
CINCUSAREUR	Commander in Chief, United States Army, Europe

Page 3306 of 3957

CINCUSARPAC	Commander in Chief, United States Army, Pacific
CINCUSNAVEUR	Commander in Chief, U.S. Naval Forces, Europe
CINCWESTLANT	Commander in Chief, Western Atlantic (NATO)
CINF	Community Imagery Needs Forecast
CINSGCY	Counterinsurgency
CIO	(1) Central Imagery Office; (2) Chief Information Officer
CIOC	(1) Combined Intelligence Operations Center (Korea); (2) Combat Intelligence Operations Center
CIOP	(1) Controlled Intelligence Operational Proposal; (2) CIO Program
CIP	(1) Consolidated Intelligence Program; (2) Country Information Package; (3) Critical Intelligence Parameter; (4) Combined Interoperability Program; (5) Crypto-Ignition Plug; (6) Correlation and Integration Processor

dB	Decibel
DB	Data Base
DBA	Data Base Administrator
DBAS	Data Base Applications System
DBBL	Dismounted Battlespace Battle Lab
DBC	Data Base Correlation
DBCTRL	Data Base Control
DBD	Data Burst Device
dBi	Decibel (referenced to isotropic radiator)
DBIDI	Data Base of Imagery-Derived Information
DBK	Dominant Battlefield Knowledge
dB/K	Decibels per Degrees Kelvin
dBm	Decibels (referred to 1 milliwatt)
DBMAINT	Data Base Administrator
DBMS	Data Base Management System
DBQ	Data Base Query
DBS	(1) Data Broadcast System (also known as SCAMPI); (2) Direct Broadcast Service
dBSM	Decibels Per Square Meter
dBw	Decibels Referenced to One Watt of Power
DC	(1) District Commissioner; (2) Damage Control; (3) Defense Council; (4) Direct Current

Page 3324 of 3957

DCA	(1) Defense Communications Agency; (2) Defense Cooperation Agreement; (3) Defensive Counter Air
DCAEUR	Defense Communications Agency Europe
DCAOC	DCA Operations Control Center
DCAPSS	Dual Criteria Aimpoint Selection System
DCAS	(1) Deployable Consolidated Applications Server; (2) Deployable Communications Applications Shelter
DCCC	Defense Collection Coordination Center
DCE	(1) Defensive Counter Espionage; (2) Data Communications Equipment
D-Cell	Deployment Cell
DCF	DOCS Certification Facility
DCG	Deputy Commanding General
DCGS	Distributed Common Ground System
DCI	Director of Central Intelligence
DCIA	Director, Central Intelligence Agency
DCIB	Defense Counterintelligence Board
DCID	Director of Central Intelligence Directive
DCII	Defense Central Index of Investigations
DCI&S	Director of Counterintelligence and Security
DCIIS	Defense CI Integrated Information System
DCINC	Deputy Commander in Chief
DCIP	Defense Counterdrug Intelligence Program
DCL	Direct Communications Link
DCM	Deputy Chief of Mission
DCMM	Database Creation and Management Module
DCMS	Database Creation and Management Segment
DCN	Defense Communications Network
DCO	(1) Defense Communications Office; (2) Deputy Commander for Operations (USAFE); (3) Dial Central Office; (4) Deputy Commanding Officer
DCOS	Deputy Chief of Staff
DCOSIPR	Deputy Chief of Staff, Intelligence Plans and Requirements
DCP	(1) Disaster Control Plan; (2) Decision Coordinating Paper; (3) Defense Cryptologic Program
DCR	Data Change Request
DCRSI	Digital Cassette Recording System (Improved)
DCS	(1) Defense Communications System; (2) Deputy Chief of Staff; (3) Defense Courier Service
DCS/I	Deputy Chief of Staff Intelligence
DCS/IN	Deputy Chief of Staff for Intelligence
DCSCA	Defense Communications System Central Area
DCSEC	Deputy Chief of Staff, Security
DCSI	Deputy Chief of Staff, Intelligence
DCSIM	Deputy Chief of Staff, Information Management
DCSI/DCSINT	Deputy Chief of Staff Intelligence (USAREUR)
DCSINT	Deputy Chief of Staff for Intelligence (U.S. Army)

Page 3325 of 3957

DCSLOG	Deputy Chief of Staff for Logistics
DCSO	Deputy Commander for Space Operations
DCSOPS	Deputy Chief of Staff for Operations & Plans
DCSP	Design Controlled Spare Part(s)
DCSPER	Deputy Chief of Staff for Personnel
DCS/SSI	Deputy Chief of Staff for Safety, Security, and Intelligence
DCSTOP	Damage Criteria Study Target Data Base
DCTN	Defense Commercial Telecommunications/Teleconferencing Network
DD	(1) Destroyer; (2) Deputy Director; (3) Department of Defense; (4) Differential Doppler
D&D	Denial and Deception
DDAC	Foreign Denial and Deception Analysis Committee
D/DARO	Director, DARO
D-Day	Day in which a particular operation begins
DDC	(1) Defense Documentation Center; (2) Data Distribution Center
DDCI	Deputy Director of Central Intelligence
DDCMP	Digital Data Communications Message Protocol
DDDDD	Demand-Driven Direct Digital Dissemination System
DDG	Guided Missile Destroyer
DDGN	Nuclear-Powered Guided-Missile Destroyer
DDH	Aviation Destroyer (ASW)
DDHG	Guided-Missile Aviation Destroyer
DDHGN	Nuclear-Powered Guided-Missile Aviation Destroyer
DDHN	Nuclear-Powered Aviation Destroyer
DDI	Deputy Director of Intelligence
DDL	Direct Data Link
DDN	(1) Defense Data Network; (2) Defense Dissemination Network
DDO	(1) Deputy Director of Operations; (2) Deputy Duty Officer
DDP	Defense Dissemination Program
DDPO	Defense Dissemination Program Office
DDR&E	Director, Defense Research and Engineering
DDRS	Defense Data Repository System
DDS	(1) Defense Dissemination System; (2) Dry Deck Shelter; (3) Dual Driver Service (courier)
DDS/RL	Defense Dissemination System/Receive Location
DDSP	Defense Development Sharing Project
DDSS	Document Dissemination and Storage Segment
DDT	(1) Training Destroyer; (2) Distributed Decision-Aid Terminal
DDU	Distant Device Unit
DE	(1) Damage Expectancy; (2) Directed Energy; (3) Directorate for Estimates (DIA)
DE-U	Dissemination Element-Upgrade
DE/EW	Directed Energy/Electronic Warfare
DEA	Drug Enforcement Administration
DEACON	Defense Estimates Analytical Computer On-Line Network

Page 3326 of 3957

DEB	(1) Digital European Backbone; (2) Defense Estimative Brief; (3) Debris (Orbital)
DEC	Digital Equipment Corporation
DEC (VAX)	Digital Equipment Corporation (Virtual Address Extension)
DECCO	Defense Commercial Contracting Office (now DITCO)
DECM	(1) Defense Electronic Countermeasures; (2) Deceptive Electronic Countermeasures
DECON	Decontaminate(ion)
DEDAC	Deception and Denial Analysis Committee
DEDDF	Digital Elevation Data Dubbing Facility
DEF	Defense
DEFCON	(1) Defense Condition; (2) Defense Readiness Condition
DEFCOS	Defense Courier System
DEFPLAN	Defense Plan
DEFSMAC	Defense Special Missile and Astronautics Center
Deg	Degree
DEGRAD	Degradation
DELORME	a Digital Mapping Computer Program
DEMEX	Demonstration Exercise
DEMOD	Demodulator
DEMONS	Demonstration System
DEMPC	Data Exploitation, Mission Planning, Communications/Center
DENAS	Daily European Naval Activity Summary
DEP	(1) Deflection Error Probable; (2) Defense Estimate for Production; (3) Deployed
DEPCOMNAVCENT	Deputy COMNAVCENT
DEPCOMUSNAVCENT	Deputy Commander, U.S. Naval Forces Central Command
DEPREP	Deployment Report
DEPSECDEF	Deputy Secretary of Defense
DEPT	Department
DES	(1) Digital Exploitation System; (2) Data Encryption Standard
DESA	Defense Evaluation Support Activity
DESC	Defense Electronics Supply Center
DESIGN	Designator (U.S. Navy)
DESIST	Decision Support and Information System for Terrorism
DESS	Defense Exploitation Support System
DESRON	Destroyer Squadron
DET/Det	Detachment
DEW	(1) Distant Early Warning; (2) Directed Energy Weapon
DEWLINE	Distant Early Warning Line
DF	(1) Direction Finding; (2) Disposition Form; (3) Deuterium Floride
DFAD	Digitized Feature Analysis Data
DFDS	Data Facility Dataset Services
DFED	Digitized Features Data
DFH	Deployed Forward Headquarters

Page 3327 of 3957

DFLP	(1) Defense Foreign Language Program; (2) Democratic Front for the Liberation of Palestine
DFM	Deterrent Force Modules
DFOV	Dual Field of View
DFRIF	Defense Freight Railway Interchange Fleet
DFS	Direction Finding Subsystem
DFT	(1) Deployed for Training Team; (2) Deployment for Training
DG	Defense Guidance
DGCL	Ground Mobile Forces Control Link
DGCS	Downsized Ground Control Station
DGCT	Downsized Ground Control Terminal
DGIAP	Defense General Intelligence Applications Program
DGIF	Deployable Ground Intercept Facility
DGIS	Director General Intelligence and Security
DGITS	Digital Graphics Information Tailoring System
DGS	Deployable Ground Station
DGU	Downgrade to Unclassified
DGZ	(1) Desired Ground Zero; (2) Designated Ground Zero
DH-7	deHavilland Dash 7 (Drug Interdiction Aircraft)
DHCA	Data Handling Capability Analysis
DHFN	Direct Hire Foreign National
DHS	Defense HUMINT Service
DI	(1) Director of Intelligence (USEUCOM); (2) Directorate for Foreign Intelligence (DIA)
DIA	(1) Defense Intelligence Agency; (2) Defense Intelligence Assessment
DIA/CS	Defense Intelligence Agency/Command Support
DIAAPR	Defense Intelligence Agency Appraisal
DIAC	Defense Intelligence Analysis Center
DIAI	DIA Instruction
DIAIAPPR	DIA Intelligence Appraisal
DIAL	Defense Intelligence Agency Liaison
DIAL-J	DIA Liaison Office for Japan
DIALO	DIA Liaison Office
DIALOG	DIA Information Retrieval System
DIAM	Defense Intelligence Agency Manual
DIAMCP	DIA Master Contingency Plan
DIANM	DIA Analytical Memorandum
DIAOB	Defense Intelligence Air Order of Battle
DIAOLS	DIA On-Line System
DIAPF	DIA Part File
DIAR	DIA Regulation
DIATP	DIA Tactical Program
DIATS	DIA Terrorism Summary
DIB	(1) Defense Intelligence Board; (2) Defense Intelligence Brief; (3) Directory Information Base

Page 3328 of 3957

DIC	(1) Defense Intelligence Community; (2) Difference in Condition; (3) Defense Intelligence College (Now JMIC); (4) Defense Intelligence Commentary
DICBM	Depressed Intercontinental Ballistic Missile
DICP	Defense Intelligence Counterdrug Program
DID	(1) Data Line Description; (2) Defense Intelligence Digest (Now Military Intelligence Digest); (3) Data Item Description
DIDHS	Deployable Intelligence Data Handling System
DIDOP	Digital Image Data Output Product
DIDS	Defense Intelligence Dissemination System
DIDSRS	Defense Intelligence Dissemination, Storage and Retrieval System
DIE	Defense Intelligence Estimate
DIEB	Defense Intelligence Executive Board
DIEC	Deployable Imagery Exploitation Capability
DIEPS	Digital Imagery Exploitation and Production System
DIEM	Defense Intelligence Estimates Memorandum
DIEOB	Defense Intelligence Electronic Order of Battle
DIFAR	(1) Directional Frequency Analysis and Recording System; (2) Directional Frequency and Ranging
DIFAX	(1) Defense Intelligence Facsimile; (2) Defense Intelligence Security Facsimile Network
DIFM	Defense Intelligence Functional Manager
DIFR	Defense Intelligence Facility Report
DIGITS	Digital Geographic Information Tailoring System
DIGOB	Defense Intelligence Ground Order of Battle
DIH	Daily Intelligence Highlights
DIHEST	Direct Induced High-Explosives Simulation Technique
DII	Defense Information Infrastructure
DIIN	Defense Imagery Intelligence Notice
DIIP	Defense Intelligence Interoperability Panel
DIIPS	Digital Imagery Interactive Processing System
DIIS	DIA Integrated Intelligence System
DILC	Dedicated Intelligence Loop Circuit
DIM	Defense Intelligence Memorandum
DIMES	Digital Image Manipulation & Enhancement System
DIMMD	Diver Integral Magnetic Mine Detector
DIMOB	Defense Intelligence Missile Order of Battle
DIMSS	DSN Integrated Management Support System
DIN	(1) Defense Intelligence Notice; (2) Defense Intelligence Network; (3) AUTODIN
DINAH	Desktop Interface to AUTODIN Host
DINOB	Defense Intelligence Naval Order of Battle
DINSUM	Defense Intelligence Summary

Page 3329 of 3957

DIO	(1) Defense Intelligence Officer (DIA); (2) District Intelligence Officer (U.S. Navy); (3) Defence Intelligence Organisation (Australian)
DIOB	Defense Intelligence Order of Battle
DIOBS	Defense Intelligence Order of Battle System
DIOP	Defense Intelligence Objectives and Priorities
DIP	(1) Defense Intelligence Plan; (2) Defense Imagery Program
DIPC	Defense Intelligence Production Council/Conference
DIPFAC	(1) U.S. Diplomatic Facilities Graphic; (2) Diplomatic Facility
DIPOLES	Defense Intelligence Photoreconnaissance On-Line Exploitation System
DIPP	Defense Intelligence Projection for Planning
DIPS	(1) Defense Intelligence Production Schedule; (2) Digital Imagery Processing System; (3) Def Intelligence Production Study
DIR	(1) Defense Intelligence Report; (2) Directive; (3) Defense Imagery Report; (4) Director; (5) Direction
DIRCM	Direct Infrared Countermeasures
DIRES	Defense Imagery Requirements and Exploitation System
DIRINT	Director of Intelligence
DIRLAUTH	Direct Liaison Authorized
DIRNSA	Director, National Security Agency
DIRNSA/CHCSS	Director, National Security Agency/Chief, Central Security Service
DIROI	Directorate Operating Instruction
DIRS	(1) Defense Intelligence Reference Series; (2) Defense Imagery Reference Series
DIS	(1) Defence Intelligence Staff (U.K.); (2) Defense Investigative Service; (3) Defense Intelligence Summary; (4) Daily Intelligence Summary; (5) Distributive Interactive Simulation; (6) Data Integration System; (7) Defense Information System
DISA	Defense Information Systems Agency
DISA-EUR	Defense Information Systems Agency-Europe
DISA-PAC	DISA-Pacific
DISA WESTHEM	DISA Western Hemisphere
DISAM	Defense Institute of Security Assistance Management
DISC	Daily Intelligence Summary Cable
DISC4	Director of Information Systems Command, Control, Communications and Computers
DISCAS	Defense Intelligence Special Career Automated System
DISE	Deployable Intelligence Support Element
DISECS	Defense Intelligence Space Exploitation and Correlation System
DISES	Defense Intelligence Senior Executive Service
DISIDS	Display and Information Distribution System/Subsystem
DISMOB	Defense Intelligence Strategic Missile Order of Battle
DISN	Defense Information Systems Network
DISNET	Defense Integrated Secure Network
DISO	Defense Intelligence Support Office

Page 3330 of 3957

DISOB	Defense Intelligence Space Order of Battle
DISP	Defense Industrial Security Program
DISPEWT	Defense Intelligence Space Electronic Warfare Threat Data Base
DISR	(1) Daily Indicator Status Report; (2) Defense Indications Status Report
DISS	(1) Digest of Intelligence and Security Services; (2) Dissemination
DISSEM	Dissemination
DISSO	Deputy Information Systems Security Officer
DIST	Digital Imagery Support Terminal
DISTAFF	Directing Staff (NATO Commands, JECG)
DISTS	Defense Intelligence Secure Telephone System
DISTP	Defense Intelligence Special Technologies Program
DISUM	(1) Daily Intelligence Summary; (2) Defense Intelligence Summary
DIT	Defense Intelligence Thesaurus
DITB	Digital Imagery Test Bed
DITCO	Defense Information Technology Contracting Office (formerly DECCO)
DITDS	Defense Intelligence Threat Data System
DITEQ	Defense Intelligence Thesaurus Equivalency List
DITFOR	Defense Intelligence Technical Forum
DITS	Digital Imagery Transmission System
DITSUM	Defense Intelligence Terrorism Summary
DIV	(1) Division; (2) Defense Intelligence Videocassette
DIVARTY	Division Artillery
DIVISION	Enciphered Television
DIW	Dead in Water
DIWO	Duty Intelligence Watch Officer
DIWS	(1) Digital Imagery Workstation Suite; (2) Defense Indications and Warning System; (3) DOD Intelligence Warning System
DJ2	Deputy Director of Intelligence
DJS	Director, Joint Staff
DJSM	DJS Memorandum
DJTF	Deployable Joint Task Force
DJTFAC	DJTF Augmentation Cell
DLA	Defense Logistics Agency
DLAB	Defense Language Aptitude Battery
DLEA	Drug Law Enforcement Agency
DLED	Dedicated Loop Encryption Device
DLI	Defense Language Institute
DLIFLC	Defense Language Institute, Foreign Language Center
DLO	Defense Liaison Office
DLPT	Defense Language Proficiency Test
DLTV	Daylight Television
D&M	Detection and Monitoring

Page 3331 of 3957

DM	(1) Dissemination Manager; (2) Decompression Monitor
DMA	(1) Defense Mapping Agency; (2) Direct Memory Access
DMAAC	Defense Mapping Agency Aerospace Center
DMACSC	Defense Mapping Agency Combat Support Center
DMAHTC	DMA Hydrographic and Topographic Center
DMAI	Defense Mapping Agency Instruction
DMAL	Defense Mapping Agency Liaison
DMAR	Deferred Maintenance and Repair
DMB	DODIIS Management Board
DMC&GP	Defense MC&G Program
DMD	Digital Message Device
DMDG	Digital Message Device Group
DME	Distance Measuring Equipment
DMED	Digital Message Entry Device
DMFE	DAWS Message Front End
DMI	Directorate of Military Intelligence
DMOB	Defensive Missile Order of Battle
DMOS	Daily Maritime OPINTEL Summary
DMPC	Deployment Media Production Center Project
DMPI	Desired Mean Point of Impact
DMS	(1) Data Management System; (2) Defense Message System
DMSP	Defense Meteorological Satellite (or Support) Program
DMZ	Demilitarized Zone
DN	(1) Data Net; (2) Duplicate Negative; (3) Department of the Navy
DNA	(1) Defense Nuclear Agency; (2) Deoxyribonucleic Acid
DNAS	(1) DODIIS Network Access System; (2) Data Network Access System
DNC	(1) Director, Naval Communications; (2) Digital Nautical Chart
DNCC	Data Network Control Center
DND	Department of National Defence (Canada)
DNI	Director of Naval Intelligence
DNSIX	DODIIS Network Security for Information Exchange
DNVT	Digital Non-Secure Voice Terminal
DO	Director of Operations
DOA	(1) Department of the Army; (2) Date of Arrival; (3) Director of Administration; (4) Dead on Arrival
DOAT	JAC Counterterrorism/Counterintelligence Analysis Branch
DOB	(1) Depth of Burst; (2) Date of Birth; (3) Defense Order of Battle
DOC	Department of Commerce
DOCC	(1) Defense Communications Agency Operations Center Complex; (2) Deep Operations Coordination Cell; (3) DISA Operational Control Complex
DOCEX	(1) Document Exploitation; (2) Document Exploitation Center
DOCKLAMP	Defense Attache System Message Channel
DOCS	DSCS Operations Control System

Page 3332 of 3957

DoD, DOD	(1) Department of Defense; (2) Date of Death; (3) Date of Departure
DODCI	DoD Computer Institute
DODCSC	Department of Defense Computer Security Center
DODD	DoD Directive
DODEX	DoDIIS Extended
DODFCIP	DoD Foreign Counterintelligence Program
DODFDCO	Department of Defense Foreign Disclosure Coordinating Office
DODFIP	DoD Futures Intelligence Program
DODIIS	DoD Intelligence Information System
DODIIS SCINET	DoDIIS Sensitive Compartmented Information Network
DODIMS	DoD Intelligence Management System
DODIPP	DoD Intelligence Production Program
DODNACC	Department of Defense National Agency Check Center
DODSATCOM	DoD Satellite Communications Program
DOD SAT COM	DOD Satellite Communications
DODSI	Department of Defense Security Institute
DODSPECREP	DoD Special Representative
DOD TCSEC	DOD Trusted Computer System Evaluation Criteria
DOE	Department of Energy
DOF	Disposition of Forces
DOI	(1) Date of Information; (2) Duration of Illumination; (3) Director of Intelligence; (4) Imagery Division (JAC); (5) Director of Operations and Intelligence; (6) DSSCS Operating Instruction; (7) Date of Intercept
DOJ	Department of Justice
DOMS	Directorate of Military Support
DOMSAT	Domestic Satellite
DON	Department of the Navy
DOO	Daily Operations Order (NATO)
DOPS	DIA Outline Plotting System
DOS	(1) Department of State; (2) Date of Separation; (3) Disk Operating System; (4) Direct Operating System
DOSCOM	Division Support Command
DoSIP	Department of State Intelligence Program
DOSTN	Department of State Telecommunications Network
DOT	Department of Transportation
DP	(1) Duplicate Positive; (2) Development Program; (3) Displaced Person; (4) Delegated Production; (5) Directorate of Production; (6) Data Processing; (7) Decision Point; (8) Director of Personnel
DPAC	Defense Program Analysis Center
DPAE	Director, Program Analysis and Evaluation
DPAS	(1) Digital Patch and Access System; (2) Defense Priorities and Allocations System
DPC	Defense Planning Committee (NATO)
DPF	Digital Processing Facility

Page 3333 of 3957

DPG	Defense Planning Guidance
DPI	Desired Point of Impact
DPIC	(1) Decentralized Pacific Imagery Processing and Interpretation Center; (2) Defense Photographic Interpretation Center
DPICM	Dual-Purpose Improved Conventional Munitions
DPKO	Department of Peacekeeping Operations
DPL	Degausser Products List
DPM	Dissemination Program Manager
DPOB	Date, Place of Birth
DPOM	Directorate of Plans, Operations, and Mobilization
DPOMIS	Directorate of Plans, Operations, Mobilization, Intelligence, and Security
DPP	(1) Delegated Production Program; (2) Deliberate Planning Process; (3) Distributed Production Program
DPPC	Deployable Print Production Center
DPPDB	Digital Point Positioning Database
DPPG	Defense Policy and Planning Guidance
DPQ	Defense Planning Questionnaire (NATO)
DPRB	Defense Planning and Resources Board
DPRK	Democratic People's Republic of Korea
DPS	(1) Delegated Production System; (2) Data Processing Set; (3) Department of Public Safety
DPSK	Digital Pulse Shift Key
DR	(1) Director; (2) Dissemination Requirement; (3) Directorate of Resources; (4) Detection Radar
DRA	Defense Research Assessment
DRAM	Dynamic Random Access Memory
DRASH	Deployable Rapid Assembly Shelters
DRB	Defense Resources Board
DRC	(1) Defense Review Committee (NATO); (2) Defense Research Comment; (3) Data Reduction Center
DR&E	Defense Research and Engineering
DRIC	Defense Resource Identification Code
DRM	Defense Research Memorandum
DRO	Departmental Requirements Officer
DRP	Disaster Relief Program
DRS	(1) Data Relay Satellite; (2) DoD Imagery Requirements Structure; (3) Data Retrieval Subsystem; (4) Data Reconstruction System
DRSA	Defense Reconnaissance Support Activities
DRSEM	Deployable Receive Segment Engineering Model
DRSN	Defense Red Switch Network

Page 3334 of 3957

DRSP	(1) Defense Reconnaissance Support Program; (2) Defense Red Switched Program
DRU	Direct Reporting Unit
DRZ	Deep Reconnaissance Zone
DS	(1) Defense Suppression; (2) Direct Support
DS&T	Director of Science and Technology
DSA	(1) Defense Supply Agency; (2) Direct Service Activities (SIGINT); (3) Directed Search Area; (4) Division Support Area; (5) Defense Security Agency (ROK); (6) Digital Signature Algorithm
D&SA	Depth & Simultaneous Attack
DSAA	Defense Security Assistance Agency
D&SABL	Depth & Simultaneous Attack Battle Lab
DSARC	Defense Systems Acquisition Review Council
DSAT	(1) Developmental Submarine Analysis Terminal; (2) Defense Satellite
DSB	Defense Science Board
DSC	Defense Satellite Communications
DSCIS	Daily Space Command Intelligence Summary
DSCS	Defense Satellite Communications System
DSC-SLEP	Defense Satellite Communications System Service Life Enhancement Program
DSCSOC	Defense Satellite Communications System Operations Center
DSDIO	Director, Strategic Defense Initiative
DSE	(1) Direct Support Element; (2) Division Support Element
DSEC	Directorate of Security
DSFOB	Daily Strategic Forces Order of Battle
DSG	Defense Steering Group
DSI	Defense Simulation Internet
DSIATP	Defense Sensor Imagery Application Training Programs
DSIIB	Direct Support Imagery Interpretation Brief
DSIMS	Deployable SouthCom Intelligence Management System
DSI/TCCS	Defense Simulation Internet/Theater Command and Control System
DSM	Data Systems Modernization
DSN	(1) Defense Switched Network; (2) Deep Space Network
DSNET	Defense Integrated Secure Network
DSNET 1	Defense Integrated Secure Network 1 (SECRET level)
DSNET 2	Defense Integrated Secure Network 2 (TOP SECRET level)
DSNET 3	Defense Integrated Secure Network 3 (TS/SCI level)
DSO	Direct Support Operator/Operations
DSP	Defense Support Program
DSPO	Defense Special Projects Office
DSR	(1) Defense Source Register; (2) Data Service Request
DSRA	DODSPECREP-Alameda
DSRP	Defense Space Reconnaissance Program
DSRV	Deep Submergence Rescue Vehicle

Page 3335 of 3957

DSS	(1) Decision Support System; (2) Devices, Simulators and Simulations
DSSCC	Defense Special Security Communications Center
DSSCS	Defense Special Secure Communications System
DSSCS/DIN	Defense Special Security Communications System/Digital Intelligence Network
DSSR	Deep Space Surveillance Radar
DSSS	Defense Special Security System
DST	(1) Daylight Savings Time; (2) Decision Support Template; (3) Decision Support Tools; (4) Direct Support Team; (5) Digital Support Team
DSTE	Digital Subscriber Terminal Equipment
DSTF	Decision Support Task Force
DSTP	Director, Strategic Target Planning
DSTS	Deep Space Tracking System
DSU	(1) Direct Support Unit; (2) Disk Storage Unit; (3) Data Service Unit (DCTN)
DSV	Deep Submergence Vehicle
DSVT	(1) Digital Subscriber Voice Terminal; (2) Digital Secure Voice Terminal
DT	(1) Developmental Test; (2) Directorate for Science and Technology
DTA	Directorate of Threat Analysis
DTC	(1) Digital Tape Cassette; (2) Desktop Computer
DTC-2	Desktop Computer-2 (Navy)
DTD	Digital Terrain Data
DT&E	Developmental Test and Evaluation
DTE	Data Terminal Equipment
DTED	Digital Terrain Elevation Data
DTG	Date-Time Group
DTI	Doppler-Time-Intensity
DTIC	Defense Technical Information Center
DTIO	Deputy Target Intelligence Officer
DTIR	Defense Technical Intelligence Report
DTLOMS	Doctrine, Training, Leadership, Organization, Material, Soldiers
DTLS	Descriptive Top-Level Specification
DTM	(1) Data Transfer Module; (2) Digital Transfer Module; (3) Digital Target Materials
DTMF	Dual-Tone Multi-Frequency
DTNSRDC	David W. Taylor Naval Ship Research & Development Center
DTOC	Division Tactical Operations Center
DTOCSE	Division Tactical Operations Center Support Element
DTOLM	Doctrine, Training, Organization, Leader Development and Material
DTD	Data Transfer Device
DTP	Drug Testing Program

Page 3336 of 3957

DTS	(1) Diplomatic Telecommunications System/Service; (2) Data Transmission System; (3) Direct Transmission System; (4) Dedicated Transmission Service
DTSA	Defense Technology Security Administration
DTSG	Digital Technology Subworking Group
DTSS	Digital Topographic Support System
DTU	Data Transfer Unit
DTUC	Data Transfer Unit Cartridge
DUCA	Distributed Users Coverage Antennas
DUG	Deep Underground
DUPLEX	Simultaneous Transmit and Receive
DVO	Direct View Optics
DVM	Digital Voice Module
DVTC	Digital Voice Transmit Communications
D/TWP	Director, Tactical Warfare Programs
DTWS	Digital Topographic Work Station
DU	(1) Decision Unit; (2) Depleted Uranium
DUA	Directory User Agent
DUSD(AT)	Deputy Under Secretary of Defense (Advanced Technology)
DUSD(P)	Deputy Under Secretary of Defense (Policy)
DV	Distinguished Visitor
DVI	Digital Video Interactive
DVITS	Digital Video Imagery Transmission System
DVO	Defense Visit Offices
DWIO	Duty Watch Intelligence Officer (Canadian)
DWIP	Defense-Wide Intelligence Plan
DWS	Disaster Warning System
DWT	(1) Deadweight Ton; (2) Division Wing Team
DZ/LZ	Drop Zone/Landing Zone
DZ/LZ/RZ	Drop/Landing/Recovery Zone
DZS	Drop Zone Study

E

e	Elipticity
E	Evaporites (soil type)
EA	(1) Emergency Action(s); (2) Electronic Attack; (3) Executive Agent
E&A	(1) Exploitation and Analysis; (2) Engineering and Administration
E3	(1) End-to-End Encryption; (2) Emergency and Extraordinary Expenses
EAC	(1) Emergency Action Console; (2) Echelons Above Corps
EACTPC	Echelon-Above-Corps Theater Production Center
EACIC	Echelon-Above-Corps Intelligence Center
EAD	(1) Echelon Above Division; (2) Earliest Arrival Date; (3) Extended Air Defense
EADSIM	Extended Air Defense Simulation
EAM	(1) Emergency Action Message; (2) Event Analysis Matrix
EAMA	African States Associated with the EEC
EAMAS	Emergency Action Message Authentication System
EAP	(1) Emergency Action Procedure; (2) Emergency Action Plan
EAS	Emergency Action System
EASTLANT	Eastern Atlantic Command (NATO)
EASTPAC	Eastern Pacific
EATTG	Enhanced Automated Tactical Target Graphics
EBS	Emergency Broadcast System
EC	(1) European Community; (2) Expenditure Center; (3) Electronic Combat
ECA	(1) Enemy Capability Assessment; (2) Earth Central Angle; (3) Enemy Courses of Action
ECAC	Electromagnetic Compatibility Analysis Center
ECB	Echelons Corps and Below
ECC	(1) Eurasian Communist Countries; (2) European Communist Countries; (3) European Community Commission
ECCM	Electronic Counter-Countermeasures
ECDB	EISS Consolidated Database
ECG	Emergency Coordination Group
ECI	External Communications Interface
ECM	(1) Electronic Countermeasures; (2) European Common Market
ECMA	European Computer Manufacturer’s Association
ECMC	Enhanced Crisis Management Capability
ECMO	European Collection Management Office
ECO	Electronic Collection Outstations
ECOA	Enemy Courses of Action
ECOWAS	Economic Community of West African States
ECP	(1) Emergency Communications Plan; (2) Entry Control Point
ECPL	Endorsed Data Encryption Standard Products List

Page 3338 of 3957

ECS	(1) Electronic Combat Support; (2) European Communications Satellite
ECSC	European Coal and Steel Community
ECSM	(1) Special Assistant for Security Matters; (2) Enhanced Capability Stand-Off Munition
ECSO	European Command Special Operations
ECU	Environmental Control Unit (GSM)
ED	(1) European Capability Datum; (2) EUCOM Directive
EDA	Emergency Dissemination Authority(ies)
E-DAY	Start Day of an Exercise
EDI	European Defense Initiative
EDL	Electric Discharge Laser
EDM	Engineering Development Model
EDMS	Electronic Dissemination Management System
EDN	Emergency Data Network
EDP	(1) Electronic Data Processing; (2) ELINT Data Processor
EDPSELINT	Data Processing System
E-DRB	Expanded Defense (Planning &) Resources Board
EDRE	Emergency Deployment Readiness Exercises
E&E	Escape and Evasion
EEA	Essential Elements of Analysis
EEC	(1) European Economic Community; (2) East European Countries; (3) Enhanced Explosives Charge
EECT	End of Evening Civil Twilight
EEFI	Essential Elements of Friendly Information
EEI	Essential Elements of Information
EELS	Early Entry Lethality and Survivability
EELV	Evolved Expendable Launch Vehicle
EENT	End Evening Nautical Twilight
EEO	Equal Employment Opportunity
EEOB	Enemy Electronic Order of Battle
EEOC	Equal Employment Opportunity Commission
EES	Emergency Evacuation Study
EFCS	Electronic Filmless Camera System
EFD	Electronic Fill Device
EFS	(1) Electronic Filing System; (2) Proper Name of System
EFTA	European Free Trade Association
EFTO	Encrypted for Transmission Only
EFVS	Electronic Fighting Vehicle System
EGA	Enhanced Graphics Adapter
EGADS	Electronic Generation, Accounting, and Distribution System
EGIS	East German Intelligence Service
EHF	Extremely High Frequency
EI	Effectiveness Index
EIA	Electronics Industry Association

Page 3339 of 3957

EIB	(1) European Investment Bank; (2) External Intelligence Bureau
EIC	Economic Intelligence Committee
EIDB	EISS Integrated Database
EIDS	Electronic Information Delivery System
EIF	(1) ECMC Interface Facility; (2) Enhanced Interface Facility
EIG	Explosive Incendiary Grenade
EIP	ELINT Improvement Program
EIRP	Effective Isotropic Radiated Power
EIS	Enhanced Imagery System
EISI	(1) Electrical Interface-SWPS/IDHS 2000; (2) Electrical IDHS-90/SWPS Interface
EISS	EUCOM Intelligence Support System
EITO	EUCOM Intelligence Training Office EKIP Enhanced Korean Information Package
EKMS	Electronic Key Management System
ELDO	(1) European Space Vehicle Launcher Development Organization; (2) European Launcher Development Organization
ELECTRO-OPINT	Electro-Optical Intelligence Element
ELECTRO-OPTINT	Electro-Optical Intelligence
ELEV	Elevation
ELF	Extremely Low Frequency
ELI	Emitter Location & Identification
Elm	Element
ELMT	Element
ELINT	Electronic Intelligence
ELISA	Electronic Intelligence Search & Analysis
ELNET	European Liaison Network
ELNOT	ELINT Notation
ELOS	Extended Line of Sight
ELS	Emitter Location System
ELSEC	Electronic Security
ELSET	(1) Element Set; (2) Proper Name of System
ELT	(1) Emergency Locator Transmitter; (2) Electronic Light Table
ELT 3000	Electronic Light Table for UNIX-based system
ELV	Expendable Launch Vehicle
EM	(1) Electromagnetic; (2) Enlisted Member; (3) Environmental Monitoring
E-Mail	Electronic Mail
EMA	European Monetary Agreement
EMAP	Electromagnetic Analysis Program
EMATS	Emergency Message Automatic Transmission System
EMC	Electromagnetic Compatibility
EMCS	ELINT Mission Control System
EMCON	Emission Control
EMCP	Electromagnetic Compatibility Program

Page 3340 of 3957

EMD	Engineering and Manufacturing Development
E&MD	Engineering and Manufacturing Development
EMGTN	Equivalent Megatonnage
EMHS	EUCOM Message Handling System
EMI	Electromagnetic Interference
EMIDS	Experiment for Management Information Data Systems
EMINT	Emissions Intelligence
E-MIPE	Enhanced MIPE
EMIS	Early Mission Identification System
EMIT	Emergency Message Initiation Terminal
EMP	Electromagnetic Pulse
EMR	Electromagnetic Reconnaissance
EMSEC	Emanations/Emissions Security
EMT	(1) Emergency Management Team; (2) Equivalent Megatonnage
EMTR	Eastern Missile Test Range
EMUT	Enhanced Manpack UHF Terminal
En	Enemy
ENDEX	End Date of an Exercise
E-NET	Ethernet
Engr	Engineer
ENL	Enlisted
ENMCC	Expanded National Military Command Center
ENSCD	Enemy Situation and Correlation Division
ENSCE	Enemy Situation Correlation Element
ENSIT	Enemy Situation
ENTNAC	Entrance National Agency Check
EO	(1) Electro-Optical; (2) Executive Order; (3) Escape Orbit; (4) End Office
EOA	Early Operational Assessment
EOB	(1) Electronic Order of Battle; (2) Executive Office Building; (3) Enemy Order of Battle
EOBS	Electronic Order of Battle Server
EOC	Emergency Operations Center
EOD	(1) Explosive Ordnance Disposal; (2) Erasable Optical Disks
EOINT	Electro-Optical Intelligence
EOP	Emergency Operating Procedures
E-OPTINT	Electro-Optical Intelligence
EORSAT	ELINT Ocean Reconnaissance Satellite
EOS	Earth Observation Satellite
EOSAT	Earth Observation Satellite
EOSS	Electro-Optic Sensor System
EOTDA	Electro-Optical Tactical Decision Aids
EOW	Electro-Optic Warfare
EP	(1) ELINT Processor; (2) Electronic Protection
EP-3	U.S. Navy Reconnaissance Aircraft

Page 3341 of 3957

EPA	(1) Environmental Protection Agency; (2) Evasion Plan of Action
EPAC	Eastern Pacific
EPAMS	Exercise Planning and Message System
EPAT	Earliest Possible Arrival Time
EPDS	(1) Electronic Processing and Dissemination System; (2) ELINT Processing and Dissemination System
EPF	Exploitation Products File
EPIC	El Paso Intelligence Center
EPIRB	Emergency Position-Indicating Radio Beacon
EPL	(1) ELINT Parameters List; (2) Evaluated Products List
EPLRS	Enhanced Position Location and Reporting System
EPMO	European Production Management Office
EPR	(1) Extended Planning Annex; (2) Enlisted Performance Report
EPROM	Erasable Programmable Read-Only Memory
EPS	(1) ELINT Processing System; (2) Electronic Publication System; (3) Exploitation Problem Set; (4) Encapsulated Postscript
EPW	(1) Earth Penetrator Weapon; (2) Enemy Prisoner of War
EPWG	Exploitation Plans Working Group
EPUU	Enhanced PLRS User Units
EQV	Equivalent
ER	(1) Enhanced Radiation; (2) Electronic Reconnaissance; (3) Eastern Region; (4) EAGLE REACH
ERA	(1) Extended Range Ammunition; (2) Equal Rights Amendment
ERADCOM	Electronic Research and Development Command
ERAST	Environmental Research Aircraft and Sensor Technology
ERBM	Extended Range Ballistic Missile
ERCS	Emergency Rocket Communications System
ERADCOM	Electronic Research and Development Command
ERDAS	Earth Resources Data Analysis System
ERF	Early Reinforcing Force
ERIN	Electronic Radio Intercept Network (USCS)
ERINT	Extended Range Intercept Missile
ERIR	Electronic Reconnaissance Intercept Report
ERIS	Exo-atmospheric Reentry Vehicle Interception System
EROS	Earth Resources Observational System
ERP	Effective Radiated Power
ERPHO	Earth Resources Photographic Satellite
ERRS	Emergency Regional Reporting System
ERS	(1) Emergency Relocation Site; (2) Earth Resources Satellite
ERSSO	Emergency Reaction Special Security Officer
ERT	Executive Reference Time
ERTM	Electronic Intelligence Request Tasking Message
ERTS	Earth Resources Technology Satellite
ERTZ	Equipment Radiation TEMPEST Zone
ERW	Enhanced Radiation Weapon

Page 3342 of 3957

ES	(1) Emplacement Site; (2) Exploitation Support; (3) Electronic Warfare Support; (4) Expert System; (5) Electronic Support
ESA	(1) European Space Agency; (2) Electronically Steered Antenna
ESAA	European Special Activities Area (U.S. Air Force)
ESAC	El Salvador Analysis Cell
ESAF	European Special Activities Facility
ESAMS	Enhanced Surface-to-Air Missile Simulation
ESAR	Enhanced Synthetic Aperture Radar
ESC	Electronic Security Command (U.S. Air Force)
ESD	(1) Electronic Systems Division; (2) Ephemeris Support Data; (3) Exploitation Support Section (JSIPS)
ESF	(1) Environmental Scale Factor; (2) Extended Superframe Formatted
ESG	(1) Electronic Security Group; (2) Exploitation Steering Group
ESI	Extremely Sensitive Information
ESIAC	Electronic Satellite Image Analysis Center
ESJ	Escort Jamming
ESM	(1) Electronic Warfare Support Measures: (2) Electronic Support Measures; (3) Electronic Security Measures
ESMC	Eastern Space and Missile Center
ESMT	External Supply Management Tools
ESP	Emergency Special Measures
ESR	ELINT Summary Report
ESRO	European Space Research Organization
ESS	(1) Electronic Security Squadron; (2) ELINT Support System; (3) Exploitation Support Segment; (4) Exercise Support Sub-system; (5) Electronic Switching System; (6) Exploitation Support Section (JSIPS)
ESSA	(1) Expert System for Situation Assessment; (2) Environmental Satellite Service Administration
ESSM	Electronic Shop, Shelter-Mounted
Est	Estimated
ESV	Earth Satellite Vehicle
ESW	Electronic Security Wing
ET	(1) Enhanced Terminal; (2) Earth Terminal; (3) Embedded Training
ETA	(1) Estimated Time of Arrival; (2) Equivalent Target Area
ETAC	Enlisted Terminal Attack Controllers
ETAP	Education Training Awareness Program
ETAWG	ELINT Technical Analysis Working Group
ETC	(1) Estimated Time of Completion; (2) Et Cetera
ETD	(1) Estimated Time of Departure; (2) Effective Transfer Date
ETDS	Elapsed Time Distribution System
ETF	Enhanced Tactical Fighter
ETHICS	European Theater High Capacity Intelligence Communications System
ETI	Estimated Time of Impact

Page 3343 of 3957

ETIBS	Enhanced Tactical Information Broadcast Service
ETII	External-to-Internal Interface
ETIWCS	European Theater Intelligence Warning and Communications System
ETL	(1) Endorsed Tools List; (2) Engineer Topographic Laboratories
ETO	(1) European Theater of Operations; (2) Earth-To-Orbit
ETP	(1) Extended Tether Program; (2) Enhanced Thermal Protection
ETPL	Endorsed TEMPEST Products List
ETR	(1) Estimated Time of Return; (2) Eastern Test Range
ETRAC	Enhanced Tactical Radar Correlator
ETRO	Estimated Time Return to Operation
ETS	(1) European Telephone System; (2) Estimated Time of Separation; (3) Expiration of Term of Service; (4) Earth Technology Satellite; (5) Engineer Test Satellite
ETSC	Electronic and Telecommunications Subcommittee
ETSS	Electronic Telecommunications Switching System
ETTP	EUCOM Tactics, Techniques and Procedures
ETUT	Enhanced Tactical User Terminal
EU	Expenditure Unit
EUCI	Endorsed for Unclassified Cryptographic Information
EUCOM	U.S. European Command
EUCOM/JIC	(1) U.S. European Command/Joint Intelligence Command; (2) EUCOM Joint Intelligence Center
EUDAC	European Defense Analysis Center
EUF	ECME User Facility
EUL	Economically Useful Life
EUMETSAT	European Meteorological Satellite (Organization)
EURATOM	European Atomic Energy Community
EUSA	Eighth U.S. Army (Korea)
EUSC	Effective United States Controlled
EUTE	Early User Test & Evaluation
EUTELSAT	European Telecommunications Satellite (Organization)
EUV	Extreme Ultraviolet
EUVE	Extreme Ultraviolet Explorer
EV	Enforcement Vector
EVA	Extra-Vehicular Activity
EVC	DoD Evasion Chart
EVO	Event Verification Officer
EVR	Enemy Vulnerability Report
EVS	Electronic Visual Communications
EW	(1) Electronic Warfare; (2) Early Warning
EW/GCI	Early Warning/Ground Control Intercept
EWAC	Electronic Warfare Anechoic Chamber
EWAS	Electronic Workorder Accounting System

Page 3344 of 3957

EWC	(1) Electronic Warfare Center; (2) Electronic Warfare Coordinator
EWCC	Electronic Warfare Coordination Center
EWCM	Electronic Warfare Coordination Module
EWCS	Electronic Warfare Control System
EWIR	Electronic Warfare Integrated Reprogramming
EWIRS	Electronic Warfare Integrated Reprogramming System
EWMIS	Electronic Warfare Management Information System
EWMS	EW Mission Summary
EWO	(1) Electronic Warfare Officer; (2) Emergency War Order
EWOPFAC	Electronic Warfare Operating Facility
